We sent out a large number of plants of the Jewell Strawberry and so far as we have heard they have given excellent satisfaction. In 1885 we reported on this berry as follows and see no reason for changing our decision. We have found this to possess more points of merit than any other we have ever tested, if we may judge by the experience of two seasons. The plants are very vigorous and free from disease. The berries begin to ripen June 12. The average size is large from the beginning until the end of the season—the form broadly conical, often flattened or widened at the top. The largest berries with us measured four inches in circumference. The color is a bright red, and the quality is very good, though not best. They are firm enough to ship to a distance. Its great claim to superiority rests in the vigor of the plants, the uniformly large size of the berries, and its productiveness, in which latter respect it is thought to stand first among all known varieties of strawberries. Our first portrait of the Jewell was presented in the R. N.-Y. of July 12, 1884. We will have sent, direct from the originators, P. M. Augur & Son, Middlefield, Conn., post paid, one dozen of these plants for only one subscriber.

No. 65. Garden and Flower Seeds.
$1 Worth Given for One Subscriber.

To raise seeds successfully requires years of experience and the most perfect conditions of soil, climate, etc. Ordinarily it will not pay our readers to raise the few garden and flower seeds they require. We have accordingly arranged with our leading seedsman to compensate our friends by sending them seeds, should they be preferred to the other premiums. For one subscriber and 10c. to pay the postage we will send $1 worth of garden or flower seeds in packets. The seeds may be selected from the catalogues of any of our leading seedsmen who advertise in the RURAL NEW-YORKER.

HOUSEHOLD ARTICLES.

No. 66. Magee Mystic Range.
Given for 57 Subscribers.

This range gave unbounded satisfaction to our agent who had the good fortune to get it last year, and we are glad to be able to offer it again. The Magee Furnace Co. is one of the oldest and most reliable firms in the country; they are noted for their superior stoves and honest dealing. Their main office and salesrooms are in Boston, where daily immense numbers of stoves and ranges are sold. They have also branch wholesale houses at 92 Beekman Street, N. Y.; 86 Lake Street, Chicago; 8 and 10 Pine Street, San Francisco; and with Bood Bro., Kansas City; and their stoves are retailed in nearly every town of this country, and are everywhere the standard of excellence,

none claiming to make better. The Mystic is one of their latest and best ranges. It is made in various styles and at various prices, but all work splendidly. The prices vary according to size and fixtures. We will send any size or priced range for the number of subscribers corresponding to the value of the range in dollars. For example we will send a Mystic Range like the cut, having six eight inch holes, a reservoir holding 10 gallons, a cabinet base with polished edges, a high shelf, a very large ash-pan, and an oven 20x20 inches, fitted for coal or wood as desired, price $57, for 57 subscribers, or a lower priced one for a less number of subscribers, Send for a catalogue and make your selection.

No. 67. Magee's Ideal Parlor Heater.
Given for 36 Subscribers.

This base-burning, self-feeding, hard-coal stove is beautiful in design and perfect in workmanship. It is of the latest style, and would be an ornament to any parlor. It is also made by the Magee Furnace Co., of Boston. Its price is $36. We will send it for 36

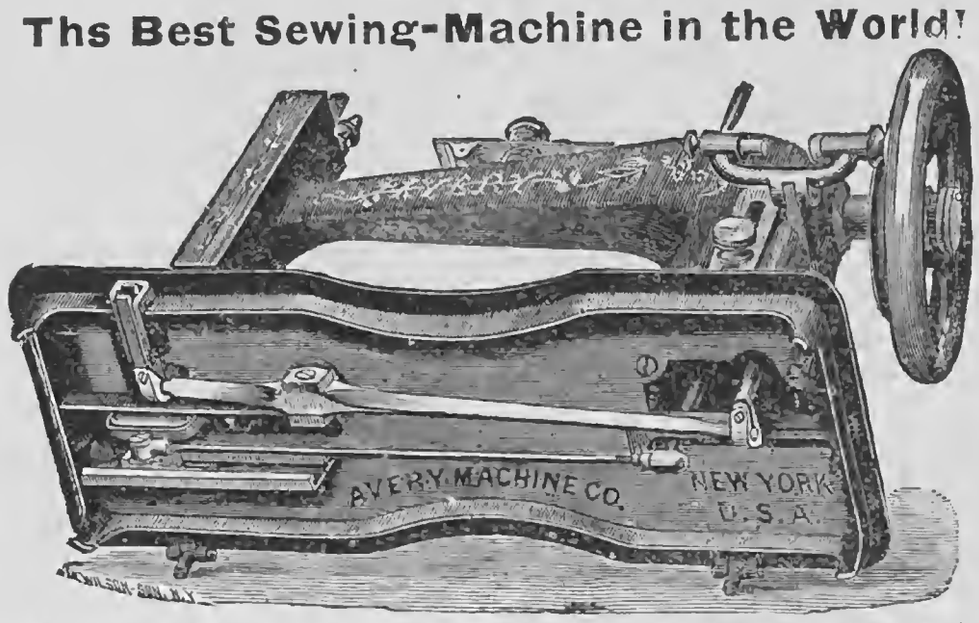
subscribers, or a larger or smaller size on the same conditions as the range. We will send almost any style or priced stove, ranges or heater, from the same firm on the same conditions, viz., a number of subscribers corresponding to the value of the stove in dollars. Send to the Magee Furnace Co., of Boston, for a catalogue and you will appreciate this offer.

No. 68. Carpenter's Dust Pan.
A Pair for One Subscriber.

This is perfection in the way of a dust pan. It is self-supporting. The person who uses it stands erect and does not inhale the dust, and can use both hands in handling the broom. It is made by F. W. Carpenter, Harrison, Westchester County, N. Y. Costs 50 cents, is worth ten times the money, and will captivate any lady who gets it. We will give a pair of them for one new subscriber.

No. 69. The Avery High-Arm Sewing Machine.
Given for Twenty Subscribers.

Ths Best Sewing-Machine in the World!



We stated last year that in our opinion the Avery is the lightest-running, stillest, most reliable machine ever invented. One year's further acquaintance with the machine justifies us in making this assertion even stronger than before. We firmly believe it to be superior to all other machines upon the market, and we are satisfied that a personal examination will convince any one of its superiority.

The Avery machine, which we show in the cut, and which we offer as a gift to those of our friends who send us clubs, is the latest triumph of inventive genius. It is a high-arm machine, almost absolutely noiseless, and by far the easiest-running machine made. It has a shuttle, makes a lock-stitch, and the shuttle and feed motion are in one piece, and there is no possibility of its getting out of "trim." The Avery is made on a new principle, having an entirely new mechanical combination, which does away with a large proportion of the pieces, and has no need of cogs, cams, links or levers, thus making it simple, easy to keep in order, and running with half the power of the older styles of machines. These machines are made by the Avery Sewing Machine Company, N. Y., in different styles, the prices varying from $45 to $65. The style which we offer retails at $60.

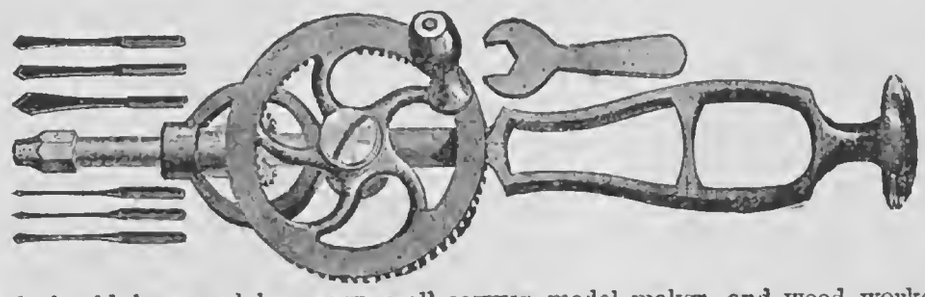
Remember, this is no old style machine, nor any imitation of any machine, such as are offered by so many papers at from $15 to $22, and dear at any price, but a brand-new machine on a a brand-new principle, and the best, easist-running, highest-priced, though cheapest, machine in the market.

We consider this, in many respects, the most remarkable premium we have ever offered. The same machine was given for forty subscribers last year, and many were disposed of. This year the machine is to be given for twenty subscribers. Think of it, friends, a $60 machine for only twenty subscribers.

No. 70. J. R. Torrey Toilet Set.
Given for Two Subscribers.

This is a complete toilet set for a gentleman. It is made in the best manner throughout and our gentlemen friends will be delighted with it. Our young readers who are just begiuning to shave should send for one of these sets made by J. R. Torrey & Co., Worcester, Mass.

No. 71. The Premium Drill.
Given for One Subscriber.



This tool should be owned by every scroll sawyer, model maker, and wood worker in the country. Many delicate pieces of scroll work, requiring hours to saw out, are ruined in putting together for lack of proper tools. One of these drills and a screw driver will be found invaluable to the scroll sawyer or wood worker after once using. Price 85 cents. Manufactured by A. H. Pomeroy, 216 and 220 Asylum street, Hartford, Conn.

No. 72. The Keystone Washer.
Given for Three Subscribers.

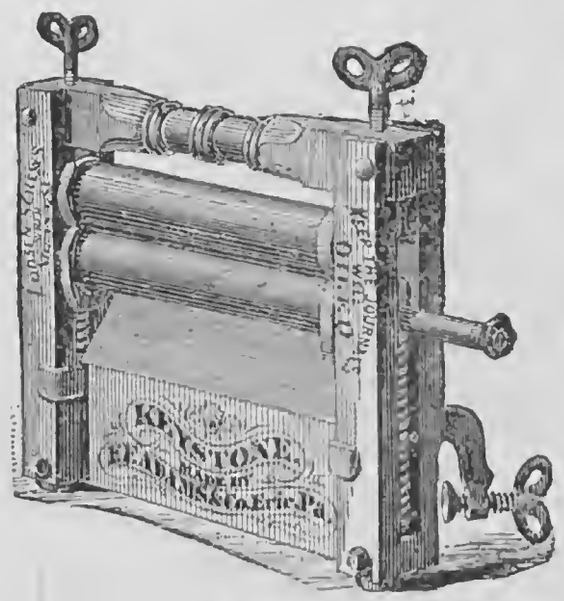
This washer is warranted by the manufacturers to wash clean, if properly used, without rubbing, anything that can be washed by hand. It is easy in operation, does not wear the clothes, and will last for years. Price $7. Made by F. F. Adams & Co., Erie, Pa.

No. 73. Special Introduction Box of Seeds. For One New Subscriber. Postage 10 Cents.

In offering this box of seeds as a premium an opportunity is presented to secure a collection of the finest variety, consisting of thirty packets of garden and three of flower seeds. Each packet is illustrated with the vegetable in colors, with full directions for culture, etc. The seeds are selected and put up by Johnson & Stokes, Philadelphia, Pa., whose reputation as seed growers is abundant guarantee of the quality. Actual value, $2.50. Sold by the dealers for $1, postpaid.

No. 74. Keystone Clothes Wringer.
Given for Four Subscribers.

This wringer has a wood frame, all the latest improvements, and greater capacity



than any other wringer. It is simple, durable and adapted to the frailest as well as the strongest fabrics. It saves time, strength, clothes and is an article indispensable to the household. Price $7.50. Made by F. F. Adams & Co., Erie; Pa.

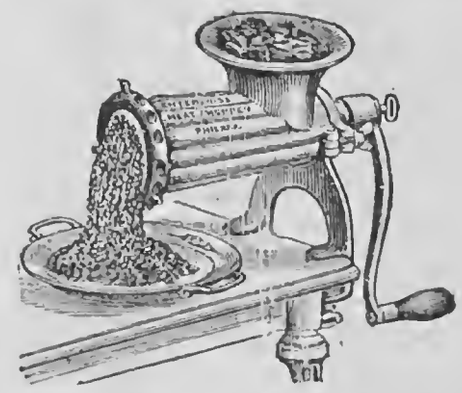
No. 75. Torreys Folding Pocket Scissors.
Given for One New Subscriber.

THESE handy little scissors are sharp pointed and are readily opened for use, but when closed the points are firmly held and protected by steel sheaths. They are perfectly safe and they will please you. Made by J. R. Torrey & Co., Worcester Mass. Price 75 cents.

No. 76. The Enterprise Meat Chopper.
No. 12, for Three Subscribers. No. 22 for Four Subscribers.

We sent out a large number of these choppers last year, and they gave the most unqualified satisfaction.

Among the necessities of every farm house is a good meat chopper. In our younger days we worked many a weary hour with the ax and chopping block, cutting meat for the annual sausage making, or with the chopping knife and bowl, cutting meat for hash or mince pies. While it was tiresome to use those tools, they did their work well. The meat was *chopped*, not *mangled*, and there was some comfort in eating what was made of it. With the invention of meat machines



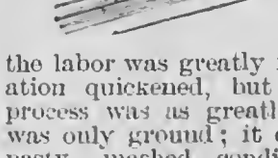
the labor was greatly reduced, and the operation quickened, but the efficiency of the process was as greatly lessened; the meat was only ground; it came from them in a pasty, mashed condition, full of strings, tendons and gristle, in such a condition as no one who had ever eaten *chopped* meat could endure. We had tried the various makes, and rejected them in disgust, as unfit to prepare meat for human food. We had got thoroughly tired of pulling strings out of our teeth, and had decided either to eat no more cut meats or go back to the old, slow hand-mode of chopping, when we chanced upon the Enterprise Meat Chopper. We have now used this for more than two years for cutting all kinds of meat and vegetables, for all kinds of purposes, and in every case we have found it simply perfect. This is a MEAT CHOPPER. It cuts the meat like a pair of shears, and does not grind, mash or tear it. It beats the old hand process with ax and block, or chopping knife and bowl, all out of sight, in cutting it better, and in doing it so much faster; and then it runs so easy, it is real fun to use it. In short, we unqualifiedly recommend this as *the* meat chopper all our friends need.

The No. 10, shown in the cut, weighs 8 pounds, chops 1 pound per minute, and sells for $3. The No. 12 is the same as the No. 10, except that it has legs instead of clamps; price $2.50. The No. 22 chops two pounds per minute; price, $4. The No. 32 will chop 3 pounds per minute; price, $6.

We will give the No. 10 for three and the No. 22 for four subscribers.

These choppers are made by the Enterprise M'fg Co., corner 3d and Dauphin Streets, Philadelphia, Pa.

No. 77. Deed Boxes.
Given for Three Subscribers.



One of these boxes is what every one needs who is not conveniently located near a bank or safe-deposit vault. They are exceedingly convenient for locking up valuable papers, such as deeds, insurance policies, agreements, etc. They are secured with a keyless "Champion" lock, and are made by the Miller Lock Company, Philadelphia, Pa., to whom requests for catalogues, giving full description, should be addressed.

No. 78. Sands' Patent Triple Motion White Mountain Freezers.
Given for Three Subscribers.

A good freezer can be used to advantage at any season of the year. Ice cream and a variety of other dishes that may be prepared with a

freezer are just as palatable in winter as in summer. In fact every family should have a freezer. The White Mountain is one of the best freezers made; it has three motions, thus mixing the cream evenly and thoroughly. They are light, easy to clean and have no large surface of zinc to come in contact with the cream. Families especially should look to this, as freezers put away damp will, when dry, show oxide of zinc, which is a well known poison. The list price of the four quart freezer which we offer is $5.50. Send for circular and receipt book to White Mountain Freezer Co., Nashua, N. H.

No. 79. Portable Furnace and Washer.
Given for 15 Subscribers.

This is a portable furnace for heating water, canning fruit, boiling cider, making apple-butter, boiling corn, and other purposes. Aside from these uses, it is a first-class wash-

ing machine, washing all kinds of clothing—bed and table linen—clean and without any hand-rubbing or the rubbing off of buttons. It is made by B. L. Ryder & Co., Chambersburg, Pa., weighs 200 pounds, price $35.

No. 80. Hunter's Pet Rifle.
Given for Fifteen Subscriber .

Here is something in the way of a sporting rifle which will interest all who are familiar with weapons for hunting. It was made to order in the first place for a special party which wanted rifles which would shoot accurately and also be light and easily carried. After a thorough trial it was found so convenient and trusty that they are now made and sold in large quantities. The weight is about 5¼ lbs. and it will kill at 40 or 50 rods. They are made by the J. Stevens Arms and Tool Co., Chicopee Falls, Mass., and we have no hesitation in recommending them to any of our readers who wish a hunting rifle. The price for this particular rifle is from $18 to $21, according to the size. It will pay to send for a catalogue which, with all necessary information, will be furnished to any one writing to the company as above. Mention the RURAL.

No 81 Lyman's Gun Sights.
Given for Six Subscribers.

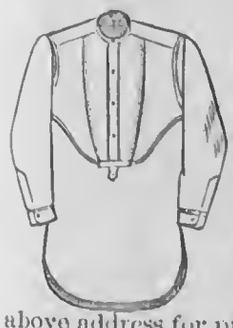
In these days when experts have got rifle shooting down to such a fine point it is essential that every one who uses a rifle should have all the latest and most approved appliances for increasing the accuracy of the weapon.

The patent Ivory Bead Front sight shown in the small cut, is said to be a great improvement as it gives the sportsman a clear white bead, which can be seen distinctly against any object, in the woods or in bright sunlight. The contrasting black neck of the Sight makes the bead all the more prominent. We will send this front sight alone for one subscriber.

The Lyman patent combination rear sight for sporting and target rifles is used and recommended by many of the most expert rifle shots in this country. It is adapted to any rifle and can be readily adjusted. One of its advantages is that when aiming this sight has the appearance of a ring or hoop, which shows the front sight and the object aimed at, without intercepting any part of the view, while with the ordinary open rear sight the most important part of the view is shut out besides the great difficulty of quickly getting the front sight in the notch of the rear sight. Almost instantaneous aim can be taken; it can be used when the light becomes too dim to use any other rear sight; it is a hundred-fold easier to shoot moving objects, running or flying, and both the eyes can be used as well as one eye; it is also far more accurate than any other open sight, and in most respects is better for target shooting than the peep sight.

These sights are made by the patentee William Lyman, Middlefield, Conn., who will send his catalogue containing a great deal of interesting matter to any one who will write for it. We will give the front sight for one subscriber the rear sight for five subscribers and both sights for six subscribers.

No. 82. The Den Shirt.
Given for One New Subscribor.



We have made a contract with the Den Shirt Factory, No. 149 North 8th Street, Philadelphia, Pa., which enables us to send by mail for only one subscriber, a good substantial dress shirt. It will be full reinforced, 3-ply bosom and bands, hand finished. Send size of collar worn (13 to 17 inches). Send to the above address for prices and further particulars. The day has gone by when shirts can be made most economically by the housewife. There is work at which she can more profitably employ herself. You cannot secure a good shirt more easily than by inducing your neighbor to subscribe for the RURAL.

THE IMPROVED LITTLE BELLE TELEPHONE.

No. 83. Sent Postpaid for Two Subscribers.

Works without the use of a battery, gives splendid satisfaction and works nicely at a distance of one mile. The Farmer can connect his house with his barn or with some central point on his farm and speak to his family from his field, the merchant his house with his store or connect his store with the homes of his customers or a central point from which his customers can order goods, boys can connect their homes with those of their friends, neighbors can connect their houses and live in direct communication with each other. No experience required.

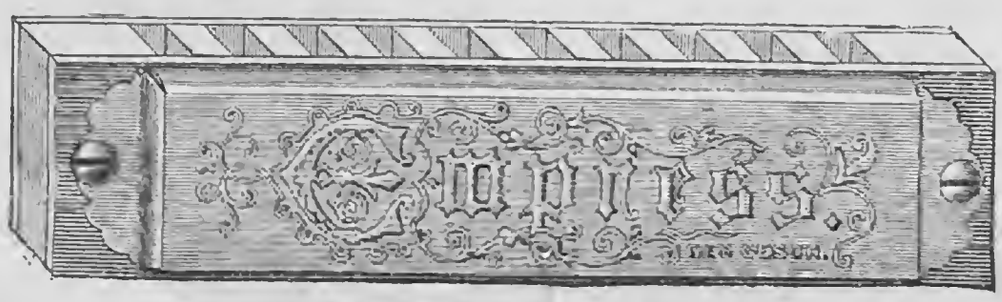
No. 84. Magic Lantern.
Sent Postpaid for Three Subscribers.

This Magic Lantern will commend itself to all who want a really first-class Lantern for a small amount of money, and should not be classed with the worthless German Lanterns with which the market has been flooded. The Lenses are imported and balance of Lantern of American manufacture. They work perfectly and will give entire satisfaction. They are neatly put up in wooden case with Lectures, Show Bills, Tickets and 30 Pictures; each picture will make a four foot circle on the screen.

No. 85. Salzard Violin Outfit.
Given for Seven Subscribers

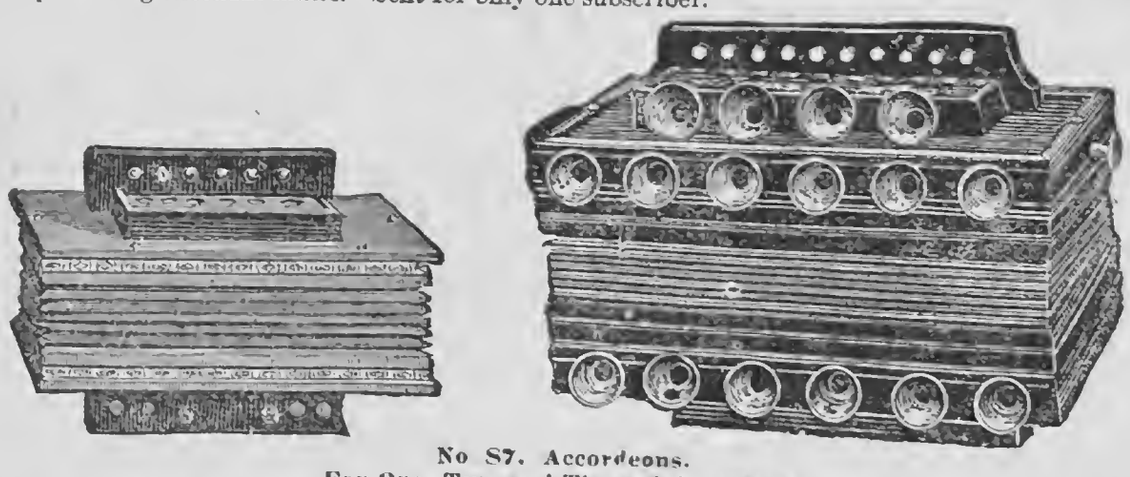
A most beautiful Violin, artistic model, graceful outline, finished and polished so as to bring out all the rich elegance of the wood, are double-lined, and of brilliant tone. Each outfit sent complete with Italian strings, fine pegs, pearl—inlaid tail-piece, fine snake-wood bow, ebony and German silver trimmings, carefully packed in plush-lined black-wood case, new model, brass handle, fastenings and trimmings. Book of Instruction, and 600 pieces of Choice Music. Price $5, or sent for seven subscribers.

Supplied by G. H. W. Bates & Co., Importers and Manufacturers, 106 Sudbury street, Boston, Mass. The RURAL NEW-YORKER SELLS nothing.



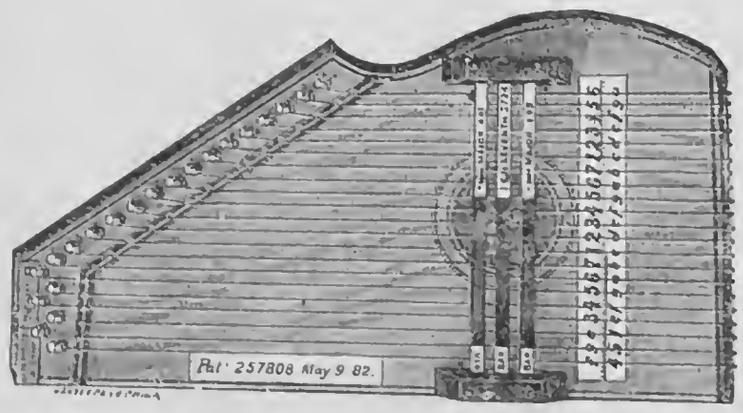
No. 86. Empress Harmonica.
For One Subscriber.

These handsome little instruments, finished in imitation of either gold or silver, are capable of producing excellent music. Sent for only one subscriber.



No 87. Accordeons.
For One, Two and Three Subscribers.

We have selected several styles and priced accordeons and think they will please our friends. An accordeon is one of the easiest musical instruments to learn to play and when well played produces very pleasing music. No. 1601, retailing for $1.50, will be sent for only one subscriber. No. 1615, price $4, sent for three subscribers. No. 1646, price $7.50, sent for four subscribers. Our musical instruments as described above are supplied by the well known manufacturer and importer, John F. Stratton, 49 Maiden Lane, New York City, whose name is a guaranty of quality and value.

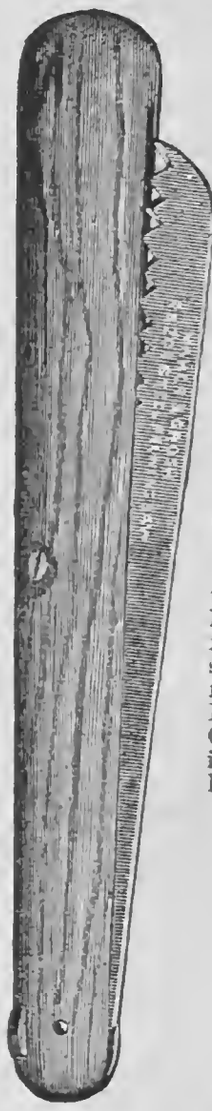


No. 88. Zimmerman's Miniature Auto Harp.
Given for Three Subscribers.

This little instrument will please those having a taste for music, but debarred from practicing it by the cost of an instrument, or the difficulty of learning. And when they see how easily they can play it, every such person will want one. It is sold by C. F. Zimmerman, importer and dealer in musical instruments, 240 North Second street, Philadelphia, Pa. Price $3.50.

No. 89. Marlin Revolver.
Given for Three Subscribers.

This revolver is made of the best material. It is fully nickel-plated; hard rubber handle, and is in all respects one of the best revolvers made. Furnished by the Marlin Fire Arms Company, of New Haven, Conn. Price $5.50. We will send one for three subscribers. This is an extraordinary offer. The RURAL NEW-YORKER SELLS nothing.



No. 90. Mead's Pocket Pruning Saw.
Given for Two Subscribers.

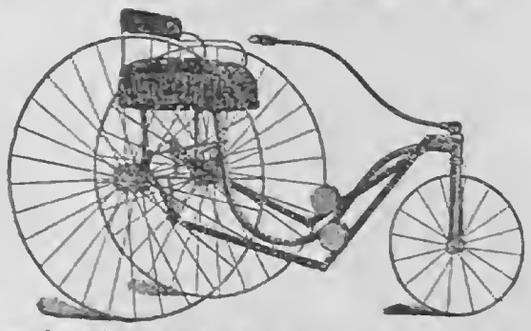
This is a new and very useful tool. The blades are hand-forged from the best razor steel; it needs no setting as blade tapers to the back. Can be carried in coat pocket; is ready for use, and, when not in use, the blade can be shut up like a knife, and is out of harm's way. Price $1. Made by Maher & Grosh, Toledo, O.

No. 91. Pruning, Whittling, and Budding Knife.
Given for Two Subscribers.

Our friends who received this knife last year speak highly of it, and we therefore offer it again this season. It is fully warranted by the makers, Maher & Grosh, Toledo, Ohio, who never send an inferior article. Price of knife, $1.

No. 92. The Fairy Tricycle.
Given for 10 Subscribers.

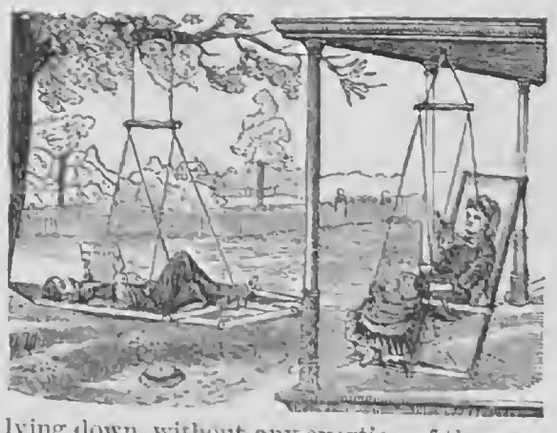
This tricycle is the best in the market in point of health, ease and grace of motion. The tendency is to keep the body erect and the shoulders back instead of bending over as children are apt to do when riding any other tricycle. No weakness or any other bad effects follow excessive riding. These are points which should be considered first of all by parents when purchasing tricycles for their children. It can be used anytime when snow is not on the walks, and especially in stormy



weather they protect the clothes and feet from the wet in taking outdoor exercise or going on errands and become most useful as well as pleasant. Is is a good hill climber and perfectly safe to descend any hill. It is just the thing for school girls who have long or short distances to go. No child can afford to be without one and the price is within the reach of all. The No. 1, price $10, given for 10 subscribers; or the No. 2, price $12, given for 12 subscribers. Manufactured by the Fay Manufacturing Company, Elyria, Ohio.

No. 93. The White Mountain Hammock Chair.
Given for Three and Four Subscribers.

This combined hammock chair is adapted to the house, lawn, porch or camp, and is chock full of comfort and blessed rest. It assumes and can be used in any position from sitting to



lying down, without any exertion of the occupant. The cheapest and best article in the world for the enjoyment of fresh air. Price, $3, with stand $4. The Alford & Berkele Co., 77 Chambers Street, New York.

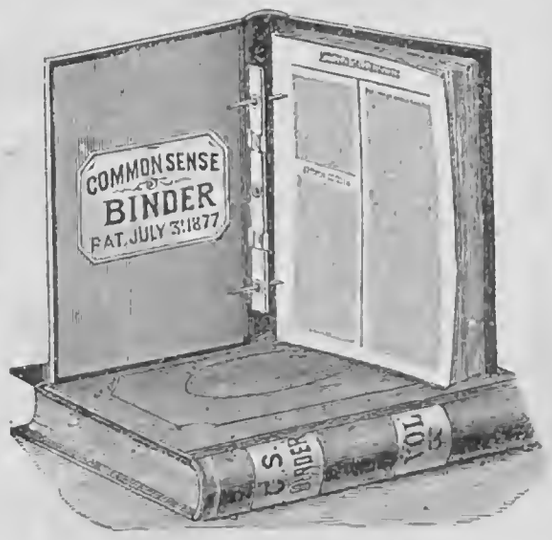
No. 94. The Ideal Fountain Pen.
Given for Two Subscribers.

A farmer or any one else who fails to use every labor saving devise of merit makes a mistake. If you spend five minutes every day for a year getting out your inkstand and looking up your pen, you lose in a year, nearly three working days to say nothing of loss in worry and ill nature over dry ink-stands and broken or rusted pen-points. The Ideal Fountain Pen is a labor-saving implement just as much as is a harvesting machine or a sulky plow, and everyone who has writing to do should have one. It is a pen for every-day use at the desk, or can be carried in the pocket and used when occasion requires. It is a first-class gold pen attached to a hard rubber pen-holder, carrying ink sufficient for from 12 to 16 hours' continuous writing. The construction is plainly shown in the cut. The handle or inkholder is made in two pieces, the point section and the barrel, which are secured together by a screw joint, at which place it is opened for filling with ink. The pen (a first-class gold pen) is held in the point section by the feed bar, which also carries the ink from the reservoir to the pen only so fast as used up in the writing. The fourth piece is merely a cap which covers the pen when not in use, to protect it from injury in the pocket, and also to prevent the ink from drying up, and when removed from over the pen, it is put on as shown in cut, to lengthen the holder for use in writing. We have used this pen for 15 months, and can fully recommend it to every one as the best pen we have ever seen Last year we handled hundreds, giving it as a premium for four subscribers. It is now offered for only two subscriptions, and every one of our friends should secure one. We do not wish our readers to confound this with the cheap fountain pen, or with the old stylographic pen, as it is fully equal to any gold pen made, and is worth a basketful of the cheap, poor trash, and we guarantee it to fit to your hand, or you can change till you get one that does fit. This is a pen that every clerk, school teacher, canvasser or farmer needs. It is made by L. E. Waterman, No. 155 Broadway, N. Y. The prices range from $2.75 to $7. Send for circular as above, see what the pen is, and then go to work and secure one. We know you will never regret it.

The Nos. 1, 2, and 3, are most suitable for ladies use; we will send either number for two subscribers. The No. 4 is the medium size and is well adapted for ordinary use. We will send one for two subscribers. The larger sizes, No. 5, 6 and 7 will be sent for three, four and five subscribers respectively. If you desire the pen sent by registered mail send 10c. for fee, Farmers, Clergymen, Boys, Girls, School-teachers, Everybody, here is a chance you cannot afford to neglect. No more useful or appropriate present can be found for Christmas, New Year's or birth day, and you can earn one with a little effort. Send to L. E. Waterman, 155 Broadway, N. Y., for circulars.

No. 95. Common-Sense Binder.
Given for One Subscriber.

In offering this Binder as a premium we believe we are conferring an opportunity to preserve the weekly numbers of the RURAL NEW-YORKER as they appear, which will be appreciated by our readers. As its name implies it is a simple, practical device, which will file the papers, and also bind them firmly together in such a manner as will effectively and conveniently secure them as in any regularly-bound book. It is entirely free from complicated fixtures (such as needles, rubber straps, hooks or strings), and is, either as a temporary or permanent binder, simple, practical and durable. The binding device is composed of steel strips or stubs, between which the papers are firmly held—as in a vise—by means of two or more steel fasteners, which cannot stretch and allow the papers to work loose, or the book to sag from the cover; the back being flexible, adjusts itself to any thickness, hence the volume always corresponds to the actual thickness of the papers bound.

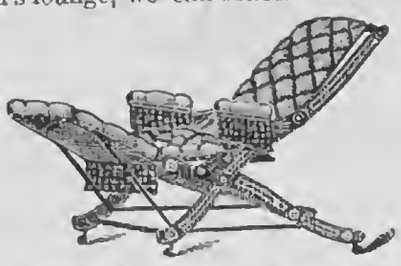


These binders have black cloth sides, upon one of which is stamped the name of the RURAL NEW-YORKER, thus making a neat volume, which would not be out of place upon the library table. We presume most of our readers preserve their RURALS, and we trust they will secure one of these handsome and convenient articles for that purpose.

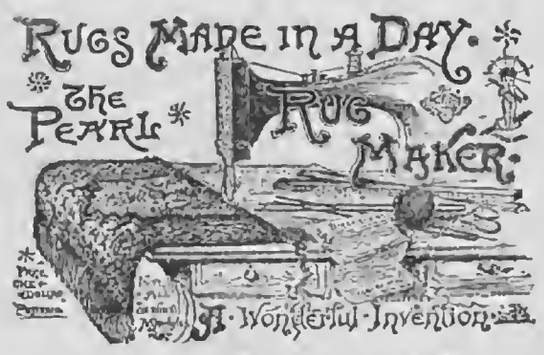
The binders are made and furnished by the well-known house of Asa L. Shipman's Sons, No. 10 Murray Street, New York, who make twenty-six different sizes for music, magazines, pamphlets, and periodicals of all kinds.

No. 96, The Luburg Adjustable Chair.
Given for 13 Subscribers.

The ordinary chair affords very little rest to a weary person or an invalid, and an easy-chair is a comfort that should be in every household. Of all the easy chairs made none quite so fully "fills the bill" as Luburg's adjustable chair. It is made of solid walnut, neatly and durably upholstered in various materials according to the taste of the purchaser and the price he cares to pay. Having over 50 changes of position into which it can be put, from the upright reception chair to the invalid's lounge, we can conceive of no shape



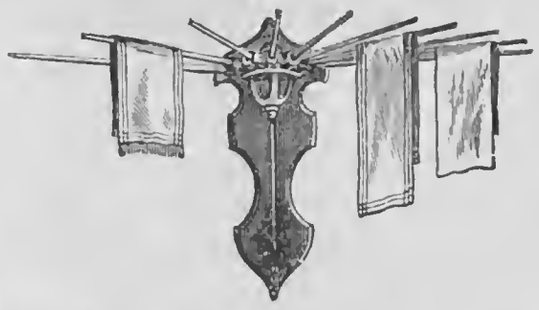
into which a tired person wishes to get or an invalid's caprice might suggest, that this chair will not assume. And, then, for the student or reader or the editor even, it has an adjustable reading or writing desk which can be attached and placed in any position. We can think of no more appropriate or acceptable wedding, birth-day or Christmas present than one of these chairs. They are simply solid comfort. Made by the Luburg Manufacturing Company, No 145 North 8th Street Philadelphia, Pa. The price varies from $7.00 to $35.00. We shall give the No. 23 chair, with new patent combination spring, price $13.00, for 13 subscribers.



No. 97, Given for One Subscriber.

Ladies don't buy a new carpet. If you wish to be economical, you can cover those worn places with home made rugs. If you do not have enough bright-colored pieces in your rag bag, you can color them at a trivial expense. With the Pearl Rug Maker many ladies make an entire carpet. When making large rugs or carpets, it is advisable to make them in sections, or pieces about 1½x2 feet, and then join them by sewing the edges securely together on the back. (This is fully explained in the illustrated directions.) It can be used on any sewing machine or by hand. Price, postpaid $1. Supplied by the Pearl Art Co., 23 Union Square, New York City.

No. 98. Empire Drying Bars.
Given for One Subscriber.



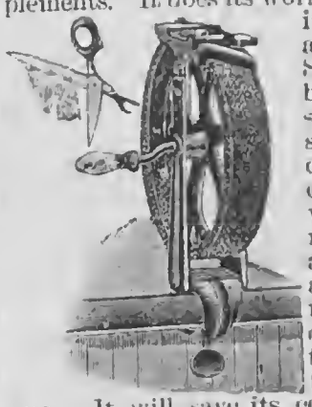
OPENED FOR USE.

CLOSED.

This is one of the neatest, most compact and best made towel or clothes racks for drying purposes in the market. It requires small space when in use and can be folded up out of the way when not wanted. It is nicely finished, and the castings are galvanized. Its capacity when opened is ten arms each two feet in length. The price is $1. It is made by the Empire Wringer Co., Auburn, N. Y., who also make the celebrated Empire Wringer.

No. 99. The "Household" Patent Emery Wheel Knife Sharpener.
Given for One Subscriber.

This valuable machine meets the demand for a practical and inexpensive article for sharpening Knives, Scissors, and other cutting implements. It does its work quickly and effectively. The Adjustable Table with Scissor Guide, enables anyone to sharpen knives or scissors properly. It can be raised or lowered as desired. The wheel is 6 x 1, with rim of solid emery, and warranted durable. The Machine is fastened to a table or shelf by turning a thumbscrew. Every family should have one. It will save its cost many times in the course of a year. It will be sent to any address by the Crystal Emery Wheel Co., of Northampton, Mass, for $1.50 or we will send it for one subscriber.



No. 100. Artist's Outfit.
Given for One Subscriber, with 10c. for postage.

How to Learn to Draw and Paint in Water Colors Without a Teacher, and ten moist water colors and three brushes in a japanned tin box.

The above is a complete outfit for learning to paint in water colors without a teacher.

The book is a series of introductory lessons in Drawing and Painting in Water Colors, by Marion Kemble. It is more than a text book. It is a series of lessons, and should be appreciated as such.

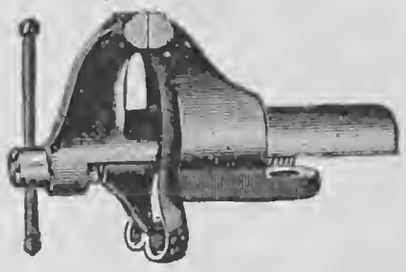
Either of the above sent by mail on receipt of 50c., or both for $1. S. W. Tilton & Co., 333 Washington street, Boston.

No. 101. "Grand Rapids" Carpet Sweeper.
Given for Two Subscribers.

An implement which saves labor in the house is just as important as a labor saving device for outdoor use. The Grand Rapids sweeper possesses all the qualities of a broom and dust-pan combined, its brush being so constructed as to be perfectly self-adjusting under the slightest pressure. Lightly running, it will take up anything that a broom will, from any kind of carpet, while if pressure is given to it as with a broom, to remove dirt

imbedded in the carpet—still running easily—it will work wonders, being more effective than any broom. It is adapted for the lightest as well as the heaviest sweepings. Its case is unique in shape, made of rich woods, and handsomely hand decorated, which, with the contrast afforded by the color of the rubber band encircling it, makes it the handsomest as well as the best of carpet sweepers. It sells for $3, and is manufactured by the Bissell Carpet Sweeper Company, Grand Rapids, Mich. Eastern branch, 105 Chambers street, New York.

No. 102. Hayden & Barnes' Amateur Vise.
Given, with Detective Burglar Alarm, for only One Subscriber.



The finest finished and best made small vises at the price in the market. Supplied by Hayden & Barnes, Syracuse, N. Y.

No. 102. The Detective Burglar Alarm.
Given with Hayden & Barnes' Vise for One Subscriber.

Can be applied to any door or window in a few seconds. When the door is opened or window raised, the Alarm falls to the floor exploding a No. 32 blank cartridge. Packed complete with four cartridges in each box. Those of our readers who live in a tramp-infested section will be greatly pleased with this alarm. Endorsed by Hon. William B. Smith, Mayor of Philadelphia, and General James Stewart, Chief of Police. Manufactured by Spencer E. Carr & Company, Ninth and Jefferson streets, Philadelphia, Pa.

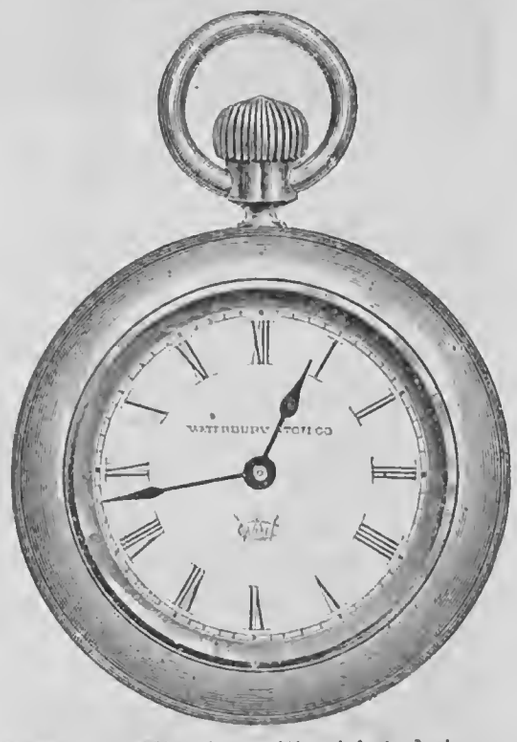
No. 103. The Improved Waterbury Watch.
Given for Four Subscribers.

The introduction of the now celebrated Waterbury Watch caused a revolution in the prices of these necessary articles, and since that time a good timepiece has been within the means of most any one.

The success attained by the Waterbury Watch Company has brought many imitators and would-be competitors into the market, but none of them have succeeded in making a watch to sell at the same price which will compare with the Waterbury. Some idea of the enormous demand for and sale of the Waterbury may be gathered from the fact that last year, at their large factory at Waterbury, Conn., there were manufactured 308,000 watches, or about one watch every two working minutes during the year.

We offer one of the latest and best of the

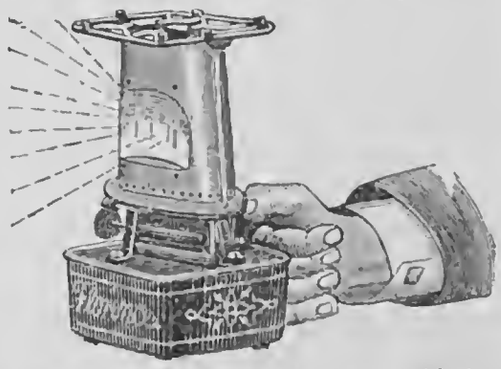
"The Waterbury."



Waterbury Watches with nickel chain as a premium for Four Subscribers this year, and we trust there will be a large demand for them.

No 104. The "Florence" Lamp Stove.
Given for Two Subscribers.

The cut below represents a lamp stove of such dimensions as to be easily carried about and yet so thoroughly made as to meet the requirements of both a stove and lamp. It illu-



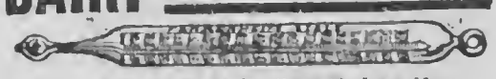
minates the room as well as a large table lamp and affords sufficient heat to boil a quart of water in eight minutes. It is absolutely safe and free from odor. The price is $2, and it is manufactured by the Florence Machine Company, Florence, Mass.

No. 105. J. R. Torrey Razor
For One Subscriber, or with Strop for Two Subscribers.

The importance of having a good razor is appreciated by every man who shaves. How often we go to the barbers to escape torture and find out too late, that we have only jumped from the frying pan into the fire. Send along a subscriber and get one of these

razors, or better yet send two and get a razor and strop and shave yourself in comfort. The blade of each razor is tested, and set ready for use, and will shave with ease the hardest beards, even those upon which other razors have failed. They are put up in elegant Gold Embossed cases and are made in three widths. The razor and strop sell for $2.50 but we will send them for only two subscribers.

DAIRY THERMOMETERS!



No. 106. For only One Subscriber.

A very neat, convenient and useful article, which every farmer should have, consisting of a glass cylindrical tube, which is easily kept clean, and there being no metal about it, there is nothing to collect or retain a trace of sour cream. To those who have often spent two hours of a cold winter day in trying to make the butter come, it will prove a priceless boon; for, by its use, taking care to get the milk or cream to the exact temperature of 62 degrees, the time spent in churning will be reduced and the butter will be better when it does come. Good butter is never made by guess-work. There is a proper temperature, and the only way to know when you have secured it is to use a thermometer. Price 50c. Furnished by W. Mitchell McAllister, Optician, No. 720 Chestnut Street, Philadelphia.

Book Premiums.

WE have in course of preparation a list of the latest and best books from the leading publishers. The list will include works of celebrated authors on a great variety of subjects adapted to the wants, and suited to the tastes of our readers.

We shall offer these books, as premiums on the most liberal terms.

The list will be sent free to all applicants.

Send for it at once.

THE INVALUABLE DOMESTIC REMEDY.

PROPRIETORS:
HANCE BROTHERS & WHITE, Phila.
For Sale by Druggists and General Merchandise Dealers.

GOOD FOR MAN AND BEAST.

BUHACH

THE GREAT CALIFORNIA

INSECT POWDER.

A pure California production, an infallible exterminator of Roaches, Bed-bugs, Waterbugs, Flies, Fleas, Mosquitoes, Ants, Moths, and in fact all insect pests of the household, field, orchard, garden, and conservatory.

BUHACH is guaranteed to be as harmless to animal and plant life as it is destructive to that of the insects.

BUHACH is the powdered blossoms of a California grown flower and absolutely contains no acids or poisonous drugs of any description.

BUHACH is not to be classed with the thousands of worthless and dangerous preparations so called "Insect Exterminators."

BUHACH is the insecticide of progress.

Pure! Powerful! Potent!

BUHACH is not sold in bulk, but in sealed tins with yellow labels, upon which appears our Trade Mark BUHACH as above. Beware of base imitations. Ask your druggist or grocer for it and see that you get it. Descriptive circulars mailed free upon application to us. BUHACH PRODUCING & M'F'G CO.

YOUNG MEN and WOMEN

EDUCATED for successful business, taught how to get a Living, make Money, and become enterprising, useful citizens.

Eastman College, POUGHKEEPSIE, N. Y., on the Hudson, the only institution devoted to this specialty, consists of the Schools of

Business combining Theory and Practice by a novel and original system of training and giving *ACTUAL* daily experience in Merchandising, Banking, and every variety of Office Work. No student can take this course and remain ignorant of actual business transactions of daily occurrence as conducted in the great exchanges of New York and London.

Phonography and Typewriting the best field for educated young ladies. Students wishing to become shorthand amanuenses are thoroughly drilled in correspondence. Students desiring to become general verbatim reporters are taken through all grades, finishing on lectures delivered in the college; in no other school in this country is this opportunity offered.

Penmanship for Business, Drawing and ornamental work. An art indispensable for teachers.

Telegraphy readily learned, and when acquired earns good pay. These schools, embracing six departments, are in charge of eight professors and five assistant instructors. *EASTMAN* has been well styled *THE BUSINESS UNIVERSITY OF AMERICA*. It is the oldest and most practical Commercial School and the largest and most popular Private School in this country. Refers to patrons in every State.

YOUNG MEN and Boys starting in life for themselves or assuming the business of a father or relative, and wanting the best preparation to assure success;

YOUNG LADIES desiring to qualify themselves for good positions, and to make themselves independent for life in a short time at a very moderate expense;

PARENTS AND GUARDIANS wanting their sons to be useful, prosperous citizens, and their daughters prepared for the accidents of life, and made self supporting;

ACADEMIC AND COLLEGE GRADUATES desiring a practical and profitable finish to their theoretical and unavailing education;

DISAPPOINTED YOUNG AND MIDDLE-AGED MEN who are tied to conservative families, or places unsuited to their ambitions and abilities, or who desire to change their course of life, by seeking places and business more satisfactory and renumerative, will find *THE NEW*, short, practical course of study here most invaluable.

There are no vacations. Applicants enter any day with equal advantage. Board and tuition fees more reasonable than in any other *FIRST-CLASS* school. Address for catalogue giving special information,

EASTMAN COLLEGE,
Clement C. Gaines, Pres't. POUGHKEEPSIE, N. Y.

GREAT MUSICAL WONDER! THE PARLOR ORGANETTE.

Plays **Hymn, Popular Airs, Quadrilles, Polkas, Waltzes, Etc.** The instrument speaks for itself,—it sings its own praises. **A mere Child can play it.** Simply turning the crank feeds the music strips, blows the bellows, and produces the music. Adapted for Singing or Dancing Parties, and Winter Evenings Entertainment. The most exquisite trills are as easily produced as a single note. Such pieces as "the Mocking Bird," are played in a manner that few organists can approach. The most difficult and complicated operatic air is played as perfectly as a simple hymn; the music is as melodious and sweet as a cabinet organ. Hundreds of the most popular tunes are ready for the instrument; the music costs but a few cents per tune.

Price $8, To introduce it **at once,** so as to sell thousands at the regular price for CHRISTMAS PRESENTS, I am willing to offer **First One** at **$4.75,** as every one sold sells others. We ask in return that you show it to your friends who are sure to order at regular price. Christmas and New Year's are fast approaching. **Now** is the time to order before the Holidays.

BUY IT FOR CHRISTMAS.

A selection of music goes free with each one. The PARLOR ORGANETTE is the handsomest, sweetest, most interesting musical instrument yet produced, and repays its cost in genuine enjoyment a hundred fold.

The PARLOR ORGANETTE has 14 large powerful organ reeds and will last a life time.

SPECIAL OFFER. On receipt of this notice and $4.75, before **Jan. 1st, 1887,** we will ship the **Organette** exactly the same as we sell for $8.00. You should avail yourself of this great offer **AT ONCE.** No such offer was ever made before or will be again. Take advantage of it while the opportunity is yours. We believe when one is sold in a town or village it will sell a dozen or more at regular price. We wish to make each purchaser our agent. Enclose $4.75 with this notice, and we will ship the **Organette,** in handsome Solid Black Walnut Piano Polished Case, with elegant carved sides, at once. Address, **G. H. W. BATES & CO.,** 106 Sudbury Street, Boston, Mass

GOLD-FILLED ELGIN OR WALTHAM WATCH ONLY $10.00!

Warranted to Wear for Five Years.

The cheapest watch in the world. Jewelers puzzled and astonished. A limited number of the celebrated Waltham or Elgin watches. Heretofore a low-priced watch has been the poorest of investments, being of no value as a time-keeper and a constant source of annoyance and expense to its owner. This watch is a marvel of accuracy and cheapness, and I am now for the first time in the world's history able to offer a low-priced, perfectly reliable time-keeper suitable for use on railroads, steamers and all other places where accurate time is required. The movements are Waltham or Elgin make, known the world over for their excellence and fine finish, having seven jewels, expansion balance, quick train, straight line escapement, gilt index to overspring regulator, sunk second, new pat. pinion, dust-proof. The handsome cases are genuine gold-filled, and with which I send a written guarantee to wear for five years. I know this watch will meet with and grow in favor as its merits and good qualities become known. There is a growing demand for such a watch, for more than ever before are the acts of everybody governed by and performed on time, and I believe that the vast army of professional men, clerks, mechanics, farmers, laborers and railroad employees, will appreciate a good watch at a cheap price, such as they can rely upon for accurate time. I wish to put you on your guard, as there are numerous irresponsible firms advertising cheap watches that are worthless as time-keepers. A printed form of fac-simile of certificate of guarantee accompanying every watch purchased from me:

"The watch purchased from me by G. S. Smith is a genuine gold-filled case, which I warrant to wear 5 years, No. 16263, genuine Elgin works, No. 3265491, and a valuable time-keeper, which I hereby guarantee and agree to keep in good order for one year under fair usages.
WILLIAM WILLIAMS, 122 S. Halsted Street, Chicago."

[The name of purchaser; the quality of the case, either gold or silver; the number of same; the number of movement, with its designated make, are inserted in italics as an illustration of the manner of filling out this certificate.]

"This certificate is binding upon me, being an absolute guarantee, and for which I at all times hold myself responsible.
WILLIAM WILLIAMS."

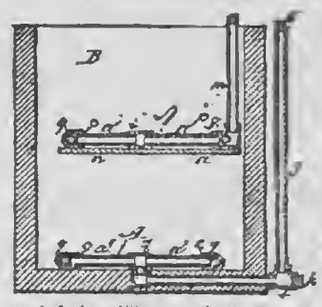
MY GRAND OFFER.—On receipt of $10.00 and this advertisement, I hereby agree to forward by registered mail to any address, all charges prepaid, one of the above described Watches and a beautiful silk guard, all securely packed in a strong casket, providing your order is received on or before May 1. I can only send a limited number of these watches at price named, and in order to protect myself from jewelers and speculators ordering in large numbers, hence I require you to cut this advertisement out and send it to me with your order, that I may know you are entitled to the benefit of this offer. Under no circumstances will I send more than one watch at above price to any one person, and if others are desired I will furnish them at regular prices. If you do not want a watch yourself, you can sell it to some neighbor, and make a handsome profit. Many of my agents sell these watches for $25 to $50. Send money by Registered Letter, P. O. Money Order or Draft, or I will send watch C. O. D., with privilege of examination, on receipt of $1.00 as a guarantee for express charges. If you have any friends carrying an Elgin or Waltham watch, I refer to them for their excellence and good time. As to my reliability I refer you to any business house in Chicago, or if you have any friends in the city, I refer you to them. In ordering, please state which you prefer—Elgin or Waltham movement. Nickel clock, $1.25, with alarm, $1.50; postage prepaid and warranted. Nickel watch, $3.00; and a full line of diamonds, gold, silver and nickel watches, which I am selling at a small advance over the cost of production, giving you the benefit of low prices obtained by making large purchases. My assortment is varied and desirable. Elegant Illustrated catalogue mailed 2c.
Address, **WILLIAM WILLIAMS,** Manufacturing Jeweler, 122 S. Halsted Street, Chicago.
Can give Rockford Quick Train Movement, instead of Elgin, if preferred. I would recommend Rockford

WE GIVE to any one sending us 50 cents for 6 months subscription to the SOCIAL VISITOR MAGAZINE, the best Story Paper published,

$1 WORTH ELEGANT LACE REMNANTS (Free.)

Here is a chance to get valuable, rich and elegant Lace Remnants and Soiled Lace for almost nothing. Having bought a big lot of Laces at auction, representing every imaginable pattern and quality, at one-tenth their real value, we are enabled to offer most astonishing bargains. We put up large assorted packages of these Laces which, though costing but 50 cents, represent real values of $1 and upwards. These Remnants include the finest White Laces, Linen Torchon in exquisite patterns, Spanish and Languedoc Cream Laces, Black Laces, and in fact samples of almost every kind known to the trade. The uses to which these Laces can be applied will appear to every lady reader, or to her male friends who wish to make an acceptable present, as no such bargain has heretofore been offered. Ladies will find them very useful for trimming all kinds of underwear, or ornamenting children's and infants' clothing, as each package contains such a variety. The supply is limited. Order at once and secure this bargain. Send 50 cents in Stamps or Postal Note. Address SOCIAL VISITOR, Box 3139, Boston, Mass.

Perfectly Preserved Green Forage.



The undersigned, having made and fed ensilage for several years, believing that we have arrived at certain and uniform success, offer to those who are in doubt this

CERTIFICATE.

This certifies that we are preserving green forage, without heat or fermentation, in silos with air-tight walls, cutting the corn in one-half to three-quarter inch lengths, weighting 100 pounds to the square foot, and with this pressure getting one foot or more of juice in the bottom of the silo. We remove the air from the silo by using Colcord's Silo Governor, which causes a heavy vertical, with very little lateral pressure. We obtain as uniform result, cold, moist, soft, pulpy forage, the natural color of the corn, without offensive odor, imparting no odor to the silo, barn, hands or clothing. We feed an average of 60 pounds daily to each cow, and our cattle eat it *all* without any waste.

We regard Mr. Colcord's system as the true, if not the only true method of ensiloing green forage crops, and recommend is as *sure, uniform, economical,* and less troublesome than any other. By using this system, with the Governor, according to directions, anyone may be sure of success.

EDMUND M. WOOD, Boston, Mass.
T. E. RUGGLES, Milton, Mass.
CHAS. L. COPELAND, Milton, Mass.
C. A. DAVIS, Natick, Mass.
BERNARD MONAGHAN, Dedham, Mass.

The above-named are reliable gentlemen. I have thoroughly examined their silos, and the green forage preserved in them; it cannot be made as economically or as good in quality in any other way. (Send to me for circulars).

S. M. COLCORD, Dover, Mass.

THE GREATEST OFFER EVER MADE TO SPORTSMEN. A FINE IMPORTED DOUBLE-BARREL BREECH-LOADER with Outfit only $12.00.

We have just purchased AT A GREAT SACRIFICE from a LEADING NEW YORK GUN IMPORTING FIRM [who have recently failed] their entire stock of the well-known and standard "BELDEN" DOUBLE BARREL BREECH-LOADING SHOT GUNS, AS ABOVE DESCRIBED. It is equal in every respect to a COLT, PARKER or REMINGTON for brilliant execution AND OTHERWISE. As we bought a large number, we have decided to offer a LIMITED NUMBER at only $12.00, each, UP TO DEC. 15, 1886 [for the purpose of introducing them more thoroughly in the United States]. AFTER DEC. 15, we shall charge the REGULAR RETAIL PRICE of $26.00. SPORTSMEN AND OTHERS can now lay aside their muzzle loaders and secure this most SUPERIOR BREECH-LOADER at the UNPARALLELED LOW PRICE of $12. The Barrels of the "BELDEN" AS OFFERED BY US are made of the finest Sheffield Steel, and each Gun is so BRANDED, besides we will send a GUARANTEE with each one. NO OTHER FIRM WILL DO THIS. Upon receipt of part of the amount, to show good faith in ordering and to cover us on Express charges, we will ship C.O.D. by Express, with privilege to examine before you accept it, or if the full amount of $12.00 is sent with order, we will send A CARTRIDGE BELT FREE and 25 Shells with each gun. ORDER NOW. CUT THIS ADVERTISEMENT OUT, to save confusion, AND RETURN WITH YOUR ORDER. This advertisement will not appear again, and it will be a very long time before we will ever again be able to make such another great and most ADVANTAGEOUS OFFER. Nothing gained by correspondence, as the Gun is fully described above. No Catalogue. Money returned, less Express charges, if it is not as represented and satisfactory. AT $12.00 IT IS THE BARGAIN OF ALL BARGAINS. Complete Set of Reloading Tools only $2.00.

Call on or address, THE BELDEN AGENCY, 9 West Broadway, NEW YORK.

BUTTER PACKAGE FREE.

We will send by mail to any address a sample of our new Butter Packages, enclosing a sample of the new German Parchment Dairy paper, *free*, on receipt of 2 two cent stamps to pay postage. This package is made of whitewood, has strong metal corners top and bottom, is round, clean and handsome. If you make poor butter and are satisfied with low prices, don't send for one. If you make good butter and want quick sales and the highest market price, use the *cheapest* and *best* Butter Package ever offered for sale.

Manufacturers of Portable, Agricultural, Stationary, and Traction

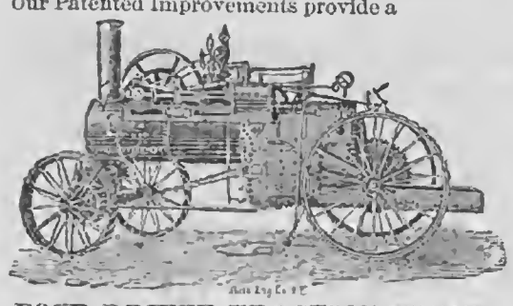
STEAM ENGINES

Of the highest standard, in every respect, of materials and workmanship. Were pioneers in the manufacture of **Practically Portable STEAM ENGINES.** And with determined policy to build only the best machinery from the best materials, and in the best manner of construction, and with continued improvements, have attained the highest standard in excellence of workmanship, simplicity of design, and capacity of power. For a third of a century have maintained their manufacture.

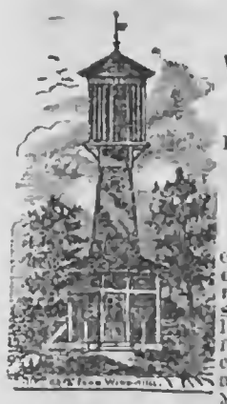
The Standard Portable and Agricultural Engines of the World.

In addition to our STANDARD ENGINES, we now offer the first **ROAD ENGINE** which has the TRACTION POWER practically and efficiently applied to the four truck wheels, and while so applied to each wheel independently, the forward axle is under full control of the steering apparatus.

Our Patented Improvements provide a



FOUR-DRIVER TRACTION ENGINE, which excels all other Traction Engines of equal cylinder dimensions in pulling capacity, and secures positive control and ease in steering on sandy, stony, slippery, uneven and otherwise difficult ground to travel. Descriptive Catalogues sent on application.



HERCULES WIND ENGINE.

STOCKBRIDGE POTATO FERTILIZER

661 BUSHELS PER ACRE.

PRIZE CROPS.

The prizes which we offered in 1885 were awarded as follows by the Vegetable Committee of the Massachusetts Horticultural Society, for the largest crop of "Pearl of Savoy" potatoes grown on the **STOCKBRIDGE POTATO MAUURE.**

1st	Prem.,	H. C. Pierson, Pitcairn, N. Y.	Yield on ¼ acre,	992 lbs., or	**661**	1-2 Bush. per acre.	
2d	"	Stephen Hoyt's Sons, New Canaan, Ct.	" "	8523 lbs., "	**568**	" "	
3d	"	Joel Burt, Sunderland, Mass.	" "	6392 lbs., "	**426**	" "	
4th	"	G. W. Sherman, Smithfield, R. I.	" "	4800 lbs., "	**320**	" "	
5th	"	G. S. Barber, South Kingstown, R. I.	" "	5461 lbs., "	**364**	" "	
6th	"	J. W. Norton, Wolcott, R. I.	" "	4530 lbs., "	**302**	" "	

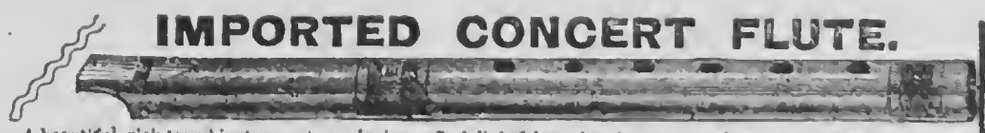
Mr. Pierson, who took the first prize, planted the crop on May 18, and harvested Sept. 24. Stockbridge Manure *alone* was used, at the rate of 1,000 lbs. per acre. The soil was a sandy loam. Potatoes were planted one piece in a hill, hoed three times, and weeded by hand.

Stephen Hoyt's Sons, who took the second prize, planted on 16th May, and harvested 23rd September. Stockbridge Manure *alone* was used, at the rate of 1,500 lbs. per acre. The soil had been used for nursery purposes, and had not been in turf for forty years. The fertilizer used on this crop was two years old, showing that these celebrated Manures do not lose their virtue by being kept over, as many farmers suppose.

BOWKER FERTILIZER COMPANY,

29 BEAVER STREET, NEW YORK, AND 43 CHATHAM STREET, BOSTON, MASS.

IMPORTED CONCERT FLUTE.



Send stamp for Catalogue of all kinds of Musical Instruments at big bargains.

A beautiful, rich toned instrument, producing soft, delightful music. Any one can learn to **play at once**, even though entirely ignorant of music. The notes are marked, and the music which accompanies the instrument is numbered in like manner, instead of being printed in notes. Thus, if you wish to play a song, or any other tune, you have only to glance at the music to ascertain the number of the note. Any one can play all the popular airs of the day, both for solo music and accompaniments to voice, piano or violin. Also dance music. *You can learn one of the easy pieces in a few minutes.* A strong, durable instrument, which will last a lifetime. Elegantly finished. Cannot get out of order. We send with it a lot of music numbered as explained above. Perfect satisfaction guaranteed. Every one who purchases endorses them and recommends them to their neighbors. Think of it! no more tedious months of study to master music. Here is a superb musical instrument all ready for use, and requiring no practice to play perfectly. Send at once, and in the CONCERT FLUTE you will have "A thing of beauty and a joy forever." We send it by mail, post-paid, for 35 Cents. Address

The RURAL NEW-YORKER'S

REMARKABLE CLUBBING COMBINATIONS FOR 1886-87.

READ THEM.

Three of the Most Enterprising Journals in the Country. All Representative Papers.

The Inter-Ocean, New York World, Detroit Free Press.

The Greatest Amount of Reading Matter and the LOWEST PRICES of any Clubbing Combination Heretofore Offered.

The rural home fully supplied—the news of the world—the most trustworthy agricultural and horticultural information—seeds, plants—all for about the price of one good paper.

Specimen Copies of any of the journals here announced as clubbing with the RURAL NEW-YORKER, will be sent without charge to all who apply. The application, however, must be made to the journal of which Specimen Copies are desired. Send for them! Subscribe through the Rural New-Yorker.

The Rural New-Yorker

continues its special arrangements with THE INTER-OCEAN, of Chicago, for Clubbing the Weekly Edition of that grand old paper with the RURAL NEW-YORKER.

The Inter-Ocean

has a National reputation as an *able, clean, bright newspaper.* The Weekly Edition is the most popular family paper published west of the Alleghanies. Its subscribers reside in *every State and Territory in the Union.* The postage paid by THE INTER-OCEAN on circulation last year amounted to $25,421.02.

THE INTER-OCEAN is a Republican newspaper. The following is quoted from its prospectus:

From the beginning THE INTER-OCEAN has stood firmly by the principles of the Republican party, and has, in season and out of season, contended for "protection to American industry." It does not agree with the idea that the mission of the Republican party is finished; on the contrary, it believes that, purified by adversity, it will in the near future again rise to the higher planes of thought and action and be completely restored to the confidence of the American people. The most important agencies in accomplishing this result will be Republican journals. If a reliable, stanch Republican newspaper was important when the Republican party was in power, it is doubly so now that the Democracy control the National Government.

IN NEWS-GETTING,

EDITORIAL ABILITY,

CORRESPONDENCE,

And everything that goes to make

A First-Class Newspaper.

THE INTER-OCEAN HAS NO SUPERIOR.

It is in its department for the family circle that THE WEEKLY INTER-OCEAN excels. Its stories and literature are the very best, and the departments under the head of "Woman's Kingdom," "Our Curiosity Shop," and "The Farm and Home," are, either of them, worth the price of a year's subscription.

THE WEEKLY INTER-OCEAN is a quarto paper of 56 columns, with frequent supplements. By special arrangements we are able to make the following offer:

THE RURAL NEW-YORKER, one year,
(With its Free Seed Distribution.)
AND
THE WEEKLY INTER-OCEAN, one year,
$2.50

IMPORTANT TO AGENTS.

A liberal commission will be allowed to Agents (for the first time) on this combination.

Persons desiring *SAMPLE COPIES* of THE INTER-OCEAN should address the publisher of that paper at Chicago.

☞SEND YOUR SUBSCRIPTIONS TO

34 PARK ROW, NEW YORK.

THE NEW YORK WORLD,

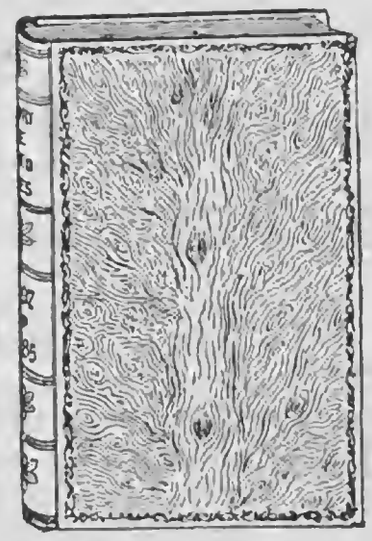
With its History of the United States, and the Rural New-Yorker, with its Free Seed Distribution, all for only $2.50, or $2.60 if the History be prepaid by mail.

The Weekly World is the Greatest Newspaper on this Continent.

The History of the
UNITED STATES

Is Bound in Leatherette Tree Calf, Gilt, and contains Twenty-Five Fine Engravings.

This dainty book of 320 12mo pages is indispensable to every one as a work of quick and convenient reference. It is printed on good paper, with wide margin, and is a prize for a bibliophile.



READ CAREFULLY.

This History is upon an entirely novel and original plan, which makes it indispensable to every person, no matter how many other histories he may have.

It is arranged chronologically by years, from 1492 to 1885. Every event is narrated in the order of its date. These are not confined, as in other works, to political matters, but embrace every branch of human action. It describes under their proper dates all important patents; all discoveries in science and the useful arts; the digging of canals and the building of railroads and telegraph lines; the founding of towns and the erection of notable buildings and bridges; the first performances of plays and the first appearances of actors and singers; fires, floods, hailstorms, tornadoes, cyclones, epidemics; accidents and disasters on sea and land; riots and crimes; panics and business failures; "corners" and phenomenal prices in all markets; labor troubles, strikes and lockouts, and hundreds of other matters never mentioned by historians, which are of the greatest importance to all who wish to understand the progress of their country. Besides being a history in the ordinary sense, it is a condensed newspaper file for 400 years.

COPIOUSLY ILLUSTRATED.

This superb work is edited, compiled, arranged and published by The World, and reflects credit upon the source from which it emanates. No such premium has ever before been given with any one, two, or even three dollar publication. The retail price of the book, bound in cloth, is $1.50; bound in leatherette tree calf, $2.00.

THE WEEKLY WORLD

Has no superior as an all-round newspaper. It is ably edited in every department, containing not only ALL the news of the week in extenso, but also having the best illustrated, literary and miscellaneous matter that appears in the Sunday edition of The World, the Journalistic Marvel, which has now attained the unprecedented circulation of over a quarter of a million copies each issue..

THE WORLD, one year, and its HISTORY OF THE UNITED STATES, THE RURAL NEW-YORKER, one year, and its FREE SEED DISTRIBUTION,

ALL FOR ONLY $2.50.

This Wonderful Offer has never before been Equaled by any Publication.

For specimen copies address
The World, New York City.

Send your subscriptions to
The Rural New-Yorker, 34 Park Row, New York City.

AGENTS, TAKE NOTICE!

A liberal commission paid to Agents and Canvassers in addition to the above offer.

NOTE:—The History will be mailed, prepaid, for 10 cents, making the entire combination $2.60, or it will be sent by express if desired at the subscriber's expense.

The Rural New-Yorker's Clubbing Combinations: Continued.

EVERY FAMILY SHOULD TAKE IT.

The most widely known, the most original, the most meritorious, and the most popular of American newspapers.

THE GREAT DOLLAR WEEKLY.

The Detroit Free Press.

The Detroit Free Press is a journal known and read in every continent where the English language is spoken. Within its special sphere it has no superior in the world.

Its contents are always pure, and in point of variety, spice and originality no other newspaper at all approaches it.

Every issue is instructive, entertaining and readable, and the delight and satisfaction with which it is received, speak without contradiction for its great merits. It only requires to be known to become a favorite with readers of judgement, taste and refinement.

It will be seen that all departments of literary endeavor are freely represented in its columns. There is fact and fiction, song and story, sketch and travel; matter for the household, the family and the individual, whether alone in nature's solitudes or surrounded by congenial friends. It does not aim to suit all tastes, but to conform to those canons of good judgment which are the distinguishing traits of well-bred people, and to give such variety, spice and completeness as comes within the limitation of all proper food for thought, material for entertainment, or matter for fancy.

If thou art a stranger to the paper, reader, send for a copy and examine it, measure its brightness, its vivacity, its purity, its fund of wit and humor, its teeming originality, its degree of instructiveness, and its great variety of contents, in all of which it surpasses most journals, and in manifold other points of excellence in which it compares favorably with the best.

Note what Harper's Monthly for August, 1886, says of the Fee Press's great humorour writer:

"C. B. Lewis (better known as 'M. Quad') is perhaps the most unique and genuine humorist this country has produced. * * * * He is naturally and spontaneously funny. Humor gushes from him like champagne from an uncorked bottle, bubbling and effusive, and drenching us, whether we will or not with laughter. And there is wisdom with his wit—strong, homely common sense mixed with a racy, unctuous humor, which makes his widom as grateful to our taste as whale oil is to the palate of an Esquimaux. He is not a 'product of the soil,' with a local flavor. He is of universal relish, as is witnessed by the wide popularity of The Detroit Free Press."

SOLUBLE PACIFIC GUANO.

This standard and high grade manure has been on the market for twenty-one years, during which period its sales have increased from 750 to 50,000 tons per annum. This result is due to its satisfactory crop-producing qualities and these qualities it is the aim of the manufacturers to maintain and if possible improve each year.

No farmer need hesitate to try a fertilizer with such a record.

It is a complete and well balanced manure and in no sense a stimulent or exhaustive of the soil as it supplies all the elements necessary for plant growth.

A lady or gentleman agent wanted in each town. Address **J. LYNN & CO.**, 769 Broadway, New York.

GOULD'S DOUBLE-ACTING FORCE PUMP

FOR SHALLOW WELLS.

FIG. 796.

The cut represents our new Double Acting Force Pump for wells 25 to 31 feet deep, although we build another style with lower or divided cylinder which may be used in wells of any depth. This pump, however, answers the general demand for a double acting lift and force pump, and possesses points of superiority over any pump of this class in the market, which is rapidly making it the favorite. The top will revolve to any given point; there is but one cylinder and plunger; this plunger is BRASS CASED; and withal it is a simple, durable and effect pump for the house or lawn, watering stock, washing carriages, etc. These pumps are easily set up, as there is no pipe and rods to change, it only being necessary to screw additional pipe in bottom of cylinder for extension draughts. Ask your dealer for the Gould Pump, or we will send you one complete on receipt of $10.00 in Post Office Order or New York Draft.

AVOID IMPURE SALT!

Salt is the cheapest article in the expense of a family, and even the poorest people can afford to use the best.

There are few families who use over one dollar's worth of salt in a year, and there is no excuse for using salt impregnated with lime, magnesia and other impurities, causing stone in the bladder and other distressing diseases. *ITS EFFECT ON THE KIDNEYS IS MOST DISASTROUS. MANY CASES OF BRIGHT'S DISEASE HAVE BEEN TRACED TO IT.*

ONLY HIGGIN'S EUREKA SALT,

is free from impurities. It is made by the only process for which the English Government granted Letters Patent, and which is as great an advance in salt manufacture as Bessemer's was in making Steel. All others crush or grind up the limey pan scale so it cannot be seen, but the *Higgin process extracts it.*

UNEQUALLED FOR SWEETNESS, PURITY AND FLAVOR.

For the Dairy, EUREKA SALT has no equal. Its remarkable antiseptic qualities makes it the "Greatest Preservative of the Age." EUREKA SALT was awarded Eleven Gold Medals (the highest awards offered) at all the International Exhibitions held since the Centennial, 1876, including New Orleans, 1885.

Ask your grocer for HIGGIN'S EUREKA SALT (remember the brand and trade mark) and if he cannot supply you, write us, and we will see that you get it. Respectfully,

THE EUREKA SALT MFG. CO., Ld.,
LIVERPOOL, and NEW YORK.

MONTOUR RANGE.

THIS range is now recognized as the leading range in the market. It is fitted up with Smyth's Patent Duplex Grate. Has the largest oven with baking qualities unsurpassed. Automatic oven shelf; Extended Fire Chamber, which adapts it perfectly for wood or coal. Ash Shute, deep Ash Pan, beautiful Nickel Name Plate, and Nickel skirting if desired, with or without water-back and reservoir. Has elevated pipe shelf of neatest design. It is also made with pouch feed, sunk hearth, wood and soft coal grate, adapting it perfectly for wood and soft coal. This range is now sold at the same price in every State in the Union, and is without doubt the largest range for the money manufactured. It is made in different sizes, and ranges in price from twenty to thirty-seven dollars and seventy-five cents. Ask your dealer to order one for you. We also manufacture a full line of square and round Parlor Heaters. In fact all kinds of stoves adapted for any market in the United States. All stoves of our manufacture fully warranted. Send for prices and further particulars.

The Swineherd.

PIG USES.

COL. F. D. CURTIS.

THAT pigs are not made more profitable on the farm is not so much the fault of the pigs as of the owner. Shut up in the barnyard, or in some close pen or yard, the pig is expensive, for it must be fed all it will eat, and it must be waited on. As time is money, the account runs up, and then the food is all more or less costly. These facts form the basis for the head of this short exhortation.

If farmers would calculate, more especially about the pigs, they would have a great deal less trouble and more money. They forget that pigs will eat grass, aye, are fond of it, and actually yearn for it. When only three weeks old, they will eat it, and it does them good. Now the thing is to have a place to turn the pigs to eat the grass. Where shall this be? Anywhere, provided there is a fence to keep them in. What shall the fence be? Anything, if it is tight. Pigs don't jump—they crawl through. Hight is not the quesion, but tightness. A stone wall is good, so is a board fence; one made of two boards and two twisted wires is capital; all wires will do but not more than four inches apart, with posts every six feet; rails are good if there are no holes; an old, broken-down wall will do leveled up and a barbed wire stretched along the top, just where the hog's head would come if he tried to climb over it. Such a fence has kept hogs in at Kirby Homestead for two years.

A ring well put in in the Spring will last all Summer, and then there will be no trouble about rooting. My text is "Pig Uses." Pigs should be used to enrich the farm, and the place to do this is in the fields. They may have a pasture by themselves, or be put into next year's prospective corn-field, or even in the meadow. I keep pigs all over, and the next year the result is seen in the early and strong-growing blades of grass, and in a good crop when corn and other grains are raised. No man can afford to keep pigs beyond the extent of slops, when shut up in a barnyard or a close pen; but any man can afford to keep pigs, if he will use the means he may, and at the same time his enterprise may cause his pigs to be factors for increased profit. Let the pigs out to grass.

NEW YORK HOG SUPPLY.

THE hogs reaching this market average between 6,000 and 7,000 daily, about 37,000 a week, or 2,000,000 a year. They come almost exclusively from the West, as the Eastern States raise only about enough to supply local demands and the neighboring towns and cities. All arrivals here are first taken to the large yard at the foot of West Fortieth Street, owned and controlled by the New York Central Railroad Co., where 50,000 can be accommodated at once. The charges are five cents per 100 pounds, and corn is supplied at $1.50 a bushel. They remain there to rest and recuperate from 24 to 36 hours. There is another reception depot on the Hackensack River west of Jersey City; and this receives at least as many as the New York inclosure. Hog slaughtering is confined to less than 20 concerns here and in Jersey City. These kill and dress, and then pass over the carcasses to the packers, smokers and large provision houses, some of whom cut, cure and distribute among retailers from 4,000 to 7,000 hogs a week, though 1,500 a week is a good trade. The dressed meat for export comes almost entirely from the West, and in passing through New York bulk is not broken. The large slaughtering houses keep buyers in the West. The hogs are shipped in double-decked cars averaging 140 medium-sized hogs per load. In dressing the shrinkage is said to average 22 per cent.—chiefly bristles, offal, blood, etc. The supply is less by about 10,000 a week in Summer than in Winter, as the demand for roasts, chops, sausages, etc., is less. The demand for bacon, hams, etc., however, is greater, but nearly all the large grocery houses obtain these almost exclusively from the West. The shipments of fresh pork from the same quarter, which are very heavy indeed in cold weather, are entirely suspended in the warm months. Of the hogs that arrive here there are three grades. The first, consisting of pigs weighing between 120 and 130 pounds, is most in demand for good family trade. The "loin grade," from 130 to 160 pounds, make hams, etc., best suited to the demands of restaurants, hotels, etc. The "bacon grade" comprises hogs heavier than the above. There is usually a difference of about 25 cents per 100 pounds between the above grades, number one bringing the highest price. Brooklyn and Jersey City are partly supplied from the above yards, and partly by stock shipped alive or dressed from the adjacent country.

Entomological.

THE CHINCH BUG IN MINNESOTA.

GEN. WILLIAM G. LE DUC.

THE special misery that has affected the agriculture of this section of country during the past season has been the chinch bug. Last year these pests were abounding and destructive in places, but this year they are infinite in number and have damaged the crops so much, and over so wide an area, that their presence and work may well be considered a great calamity. Last season (1885), they were plentiful in my wheat fields, six miles west of here, and reduced the crop one-third in quantity and one-half in quality or grade; but they were not hatched out early enough to do all the mischief they might have done; and while they partly ruined the wheat, the barley and oats escaped unharmed, and the corn was but little damaged. In some pieces of wheat seeded to clover and fertilized by sowing salt, it was thought that their ravages were prevented almost entirely. But this season the warm weather came upon us two weeks earlier than usual; the bugs hatched out in such numbers that on close observation it seemed as if the entire surface of the ground was alive and in motion. The favorable condition of the weather pushed vegetation rapidly forward, but before the wheat could form heads the work of destruction had begun, the stalks and leaves of the wheat and barley were black with minute-moving parasites sucking the juices; soon the stalks weakened, turned yellowish white, and began to sag down, and aided by the severe drought, which began just before wheat harvest, whole fields of straw broke down into a tangled, matted mass, entirely ruined and worthless for any purpose, and the bugs at this time half-grown left the blasted wheat-fields for the vigorous and promising maize.

They advanced in masses through prairie grass, clover and timothy meadows, across dusty roads or plowed ground, and assaulted the corn in columns by divisions. Each division taking a hill of corn would cover the stalks to the hight of two or three feet, and at a short distance it looked as if some careless painter had daubed the stalks over with the dregs of a paint kettle to that hight. The bugs following would pass by to the next hills or rows, and when the juices of the plants in the first row were exhausted the bugs would descend and push forward further into the field. After a few days the field of corn would begin to look as if scorched by fire, and a few days after the bugs had passed, the stalks and leaves would fall to the ground and seem to disintegrate and lose all identity. It was said that when the bugs had developed their wings they would no longer damage the corn. This I found to be a mistake. Having wings they spread over the whole country, flying in clouds and settling wherever food could be found, even in the town gardens and city grounds. A little patch of seven acres of corn (which I hoped would approach in yield the extraordinary crop I saw growing on the RURAL Long Island Farm) on my home place here, inside the corporate limits of Hastings, I thought was in no danger from chinch bugs; but they came; they saw, they settled upon and destroyed or greatly damaged the entire patch. Aided by the very severe drought, they have brought to the ground much of the Lackawaxen, an early eight-rowed yellow flint corn, and are now giving their malodorous and malignant attention to the best field of white dent I have ever seen in Minnesota.

I suppose when we recover somewhat from our amazement and semi-paralysis we will do something to avoid or prevent loss from the minute insect whose presence has brought distress and dismay to the farmers of this part of Minnesota.

Hastings, Minn.

Various.

MORE LIGHT ON FERTILIZERS.

I WAS glad to see in a recent RURAL the merits of different fertilizers as given by State agricultural stations. Give us more of the same sort. We farmers want to know where we can get the best fertilizer for the money. Experiments with fertilizers would be of the greatest help to your readers. The Eye-Opener helps us, but men who are too shrewd to drop to these confidence games are cheated by the thousand in fertilizers that are not worth half the money paid. The majority of farmers are back from the markets and cannot get the different brands to experiment with. Thus they are induced to try some brand not worth half as much as other kinds that cost but little more. I know that farmers are swindled out of vast sums of money in this way. The RURAL would be worth twice what it now is to me if on your experimental plots you would use different brands of fertilizers and report the results, hit or miss. Post us on the best brands of fertilizers. Give us the results of Mapes, Lister's, Bradley's, Peter Cooper's and all the rest. Thousands of farmers will bless you for such work, for they cannot well do it themselves.

E. P.

Greene Co., N. Y.

A VERY common dodge of swindlers, which has several times been exposed here, is to advertise for help of various kinds, who are required to deposit a certain sum "as security." After a number of victims have made the required deposit, the sharpers clear out, without having furnished the promised employment to any. Often they give some sort of work to the first dupes for a short time so as to allow them time to swindle more; but in the end they always disappear with all the deposits, unless the law impedes or hinders their flight. Not a week passes without a record of such knavery. The number of sharpers is greatest in larger cities; and countrymen seeking employment there are the principal victims; but frequently the rogues make excursions into smaller towns, where they play the same game through the local papers. Very often the employment is to be given at some distant point, but the security is always wanted off-hand, and as the salary promised is usually liberal, the swindler plausible, the deposit moderate, and the hints at great competition for the place persuasive, the knaves are, as a rule, successful. Sometimes they have desk room in a large store and tell their dupes they own the whole. We have heard of several cases where the sharper took his victim into a large store which he claimed to own; told him to wait for a few minutes until he had transacted some urgent business in his private office, went into the office of the concern, where he passed some time talking to the owner, in the character of a dealer elsewhere who intended to buy goods; then returning to his dupe, walked with him to a neighboring hotel and had no difficulty in fleecing him out of a $200 "deposit." Some of them go into small country places and advertise for workmen or clerks in another part of the country; they ask either for a deposit to insure fidelity or merely for the whole or part of the railroad fare. When they have collected a lot of money in this way, they vanish. Others put up at hotels, and pretend to be passing through or merely visiting small places, or buying goods at large ones: and advertise for help at home; but on one excuse or another, all want money in advance, and having got all they can, all disappear. Nothing so exasperates these rascals as the refusal to be caught by a person who has been nibbling at the bait. If they know such a person has money, they will run almost any risk to get it. They appear to think it belongs to them, and will generally venture more to get hold of it than an honest man would venture to recover the same amount from those who had robbed him of it. Within the last six months the Eye-Opener has noted over a dozen cases where such sharpers have been arrested in this city for using violence or intimidation to obtain the money from their victims. Similar crimes are committed all over the country. Last Tuesday a fellow called Symmons put up at a hotel in Chicago, advertised for a hotel clerk needed in the country, and asked applicants for a deposit of $75. One of these had $61, but refused to part with it, although Symmons generously declared that amount would be sufficient. Finding his promises and blandishments ineffectual, the rascal knocked down his victim, beat him so severely that there is little or no hope of his recovery, took every cent the poor fellow had, and disappeared. A brief condensation of the accounts of this form of swindling, noticed by the Eye-Opener every week in different parts of the country, would fill a column here, and would be interesting until it became monotonous, as the variations in the details of the swindle are trivial.

TO SEVERAL INQUIRERS.—J. D. Morton, M. D., Chicago, Ill., is a fraud, and his Monbutto Coca Compound, a humbug. J. W. Walker, Macon Co., N. C., who advertises Japan Clover (Lespedeza striata) and other seeds for sale, and writes about them to several papers, is "a fraud and a swindler," we are assured by one who knows him well. In Macon Co., where the fellow lives, this Japan Clover is worthless, as it is elsewhere except in the low, waste lands of the cotton country where it grows along with horse nettle, dog fennel and other pestilent weeds. Walker's puffery of it is absolutely false, and he must know it. The fellow is a microscopic counterpart of Bain, the Ohio chicken fraud..... The Reliable M'f'g Co., Philadelphia, Pa., is by no means reliable. F. Mallard & Co., of Boston, is a concern of the same kidney..... ....Thompson & Co., of "Brahma Yan, the Hindoo Deafness Cure," notoriety have been exposed here over and over again. The concern and its "cure" are sheer humbugs..... "Miss M. Casey," of Oberlin, Ohio, is an *alias* or stool pigeon of Bain, the poultry fraud.... ...We cannot recommend the Monarch Lightning Saw, or the Monarch Potato Digger. We have had a large number of complaints of each.

TRANSCONTINENTAL LETTERS.—LXIV.

MARY WAGER-FISHER.

Snow on the mountains in the middle of March; low-cut vineyards; a winery at Cloverdale; about wines; a deferred visit; Poison Oak, or Poison Ivy; local architecture; intemperance due to the wine-making industry; sage-growing

AS we continued our upward journey from Santa Rosa, amid vineyard after vineyard, it looked odd to see the mountain tops—notably St. Helena—white with snow that had fallen the previous night; the trees on the mountain tops being white as if heavily loaded with it. It was a cooler morning than usual, and when late in the evening we were on the ferry crossing San Francisco Bay a passenger said it was the coldest day that had been in San Francisco for a year, but there was no frost.

Some of the older vineyards in this valley, all the way up to Cloverdale, look in their low-cut condition like fields of planted stumps root end up. The vine stumps are from four to 12 inches in diameter, and the vineyards are cultivated like a corn field. Olives grow well in Sonoma County, and in Santa Rosa Valley prunes do especially well, and many orchards have been planted. Everything presents an appearance of wealth, but it is the general verdict that the many moderately wealthy men there, have in large part, made their money elsewhere. The land here is claimed to equal the very best in Los Angeles, San José, or Santa Cruz, and is much cheaper, although it is very far from being cheap. Various kinds of fruits do well here—apple, peach, pear and plum trees being in bloom.

When we reached Cloverdale we found that we would have between two and three hours to use as we pleased before the return of the train. As one of the large wineries of the valley was near the railway station, we first visited that—a substantial brick structure, filled with huge casks, a grape-press, and lengths of hose for transferring the wine from tanks to barrels. The wine made here is "finished" off in a winery at Santa Rosa. One of the men in charge gave us to drink—the wine was pure as water—and the red wine from the Mission grape was very pleasant. As I do not like white wine, I could not judge of that. The red wine is the entire grape crushed and fermented together; while the white is only the fermented juice. How much the manufacture of wine has added to the drunkenness of the people I have been unable to learn. Good new wine costs about 75 cents the gallon. Last year the grape crop was light. Vineyardists receive from $18 to $22 per ton for grapes, and it is conceded that if a man gets 15 cents a gallon for his grape-juice he makes about $500 per acre off his land. There are various private wineries which consume many grapes. A few years ago a great deal of wheat was raised in this valley, but now the fields of wheat are rare—mostly vines and fruit trees. For the production of tannin in wine, the hill-sides are considered the best for vines. At the convention of viticulturists in San Francisco, a good deal of attention was given to the question of unhealthful germs in wine, which the eminent French chemist, M. Pasteur, claims to be animal, and his method of destroying them by heating the wine to 150 degrees and suddenly cooling it, which also arrests fermentation, awakened great interest.

From the winery we walked through the town at the head of the valley—the mountains coming together on both sides—and stopped for a time to talk with a livery-man about horses and a carriage to drive to the Geysers, some 16 miles to the east. His charge would be $5, but he left us to infer that if we drove there and back we wouldn't care to repeat the trip, a narrow, dangerous road, but the Geysers were always spouting, we might be sure of that! However, we concluded, as we walked through the pretty town, named because there is *no* clover in it, at least I saw none in the grass out into the canyons and on to the mountains, that we would leave the Geysers and the petrified forest for our old age. In our tramp we found everywhere, as usual in our climbing expeditions, a profusion of Poison Oak, just coming into bloom. It is evidently what in the East we would call

Poison Ivy, only here it assumes a shrubby habit, and a great many people are poisoned by it. We were careful not to handle it, while feeling tolerably secure that we were not sensitive to its noxious effects. It grows in great abundance from Oregon south, in company with the beautiful manganita, laurel and madrona.

In making these northern trips, there were many kinds of people in the train—Spaniards, Italians, Swiss, Portugese, Chinese, Germans, French—a mixed population indeed. Now and then we saw an Indian, and in one place an Indian camp. A very pleasing feature of this valley was the architecture of the dwelling houses; they all looked to be new and in the pretty modern cottage style, the rooms all on one floor, and this floor elevated well above the ground, from four to six feet or more, the basement being convenient for various purposes. This construction tends to modify the labor of the household, but I have heard women say that it does not insure the privacy and quiet to be had in two-floor houses.

Since writing the foregoing, I have had a conversation with a well informed gentleman anent the effects produced upon sobriety by the wine production in these valleys. The gist of what he said was this: "In a general way, drunkenness has not increased much by the manufacture of wine. In all our larger cities, the vice of drinking is enormous, but whisky and unlimited quantities of beer are drunk. Many of our artisans and laboring men can't do a day's work without their beer. But there is a great deal of wine drinking in the families where wine is made, and nearly all the grape growers in the valleys make wine for their own use, even if selling none. A reputable physician whom I know, told me that in twenty professional visits that he made in Napa Valley—where he thought wine inebriation worst—he found ten to twelve young women suffering from delirium tremens. A good many foreigners live in these villages, who all their lives have been accustomed to drinking the light wines of Europe, but the much larger percentage of alcohol in California wines, affects them in a very harmful degree."

A young lady who knew much about the wine making districts in Sonoma, described the condition of affairs there as "perfectly terrible"—a vast amount of crime, quarrelings, etc. being the outcome of wine drinking, and it is rather astonishing that when the penalty of wine bibbling has so long been known, such vast multitudes of people continue to be deceived by it, and by the vile stuff that goes under the name of beer. One might better raise sage, as some do in California, in a small way, but reap a nice profit from it. The sage can be clipped three times a year, and sells at from six to nine cents per pound in San Francisco. An acre will yield of sage, when dry, from six to eight hundred pounds. It is a sure crop and does not require much attention. I don't think from the way in which Chinese tea is manipulated that it can be at all clean, and it is one of the things that we use without first washing it.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

MOTHER'S WORK.

BAKING, stewing and brewing,
Roasting, frying and boiling,
Sweeping, dusting and cleaning,
Washing, starching and ironing,
Ripping, turning and mending,
Cutting, basting and stitching,
Making the old like new:
Shoestrings to lace,
Faces to wash,
Buttons to sew,
And the like of such;
Stockings to darn
While the children play;
Stories to tell,
Tears wipe away,
Making them happy
The livelong day;
It is ever thus from morn till night;
Who says that a mother's work is light?

At evening, four
Little forms in white;
Prayers all said,
And the last good-night,
Tucking them safe
In each downy bed,
Silently asking
O'er each head,
That the dear Father
In Heaven will keep
Safe all my darlings,
Awake or asleep.
Then I think the old adage true ever will prove:
"It is easy to labor for those that we love."

Ah me! dear me! I often say,
As I hang the tumbled clothes away,
And the tear-drops start
While my burdened heart
Aches for the mother across the way.
Where, oh where are
Her nestlings flown?
All, all are gone,
Save one alone!
Folded their garments
With tenderest care,
Unpressed the pillow
And vacant the chair
No ribbons to tie,
No faces to wash,
No hair all awry;
No merry voices
To hush into rest;
God save them!
He took them,
And he knoweth best;
But, ah! the heart anguish! the tears that fall;
This mother's work is the hardest of all!

—*Philadelphia Sunday Republic.*

OF INTEREST TO WOMEN.

COLORED satintable cloths, such as have obtained in fashionable circles during the past year, are now denounced abroad as vulgar. Without doubt, nothing is so charming as fine white damask. Good Housekeeping says that six or seven years ago some of the young ladies in Washington society organized a society called "The Belles of the Kitchen," and at their weekly meetings they used to prepare and serve dainty dishes. It has, however, come to pass that every "belle" has got married—Miss Meigs was the last—and now some half a dozen girls of a younger generation have in turn started an organization, which they call "Six Little Cooks." They wear at their weekly meetings, at each other's houses, mobcaps and aprons of swiss muslin, trimmed with scarlet ribbons. The hostess, herself, prepares a salad, escalloped oysters, croquettes, or some other dish, which the others eat critically.

Sweeping day is a penitential day to many housekeepers, chiefly because too many consider this work conquerable only by main-strength and ignorance. Says a writer in Good Housekeeping: "Look at the average Bridget when she sweeps. She enters the room sleeves rolled up, an apron tied over her head. She opens the windows wide (especially if it is a windy day) and goes at it. No skirmishing for her. She storms the fort at once. Nothing is covered to keep it from dust. Nothing is moved unless it comes in her way, and very likely the broom goes bang against the article then before it is moved. She sweeps with a will, as if she meant to go to the foundation of things. The dust flies in clouds and gets out of the way as fast as possible, settling on curtains, tops of pictures, furniture—anywhere to get out of the way, for she is like a conquering army, sweeping all before her. And the dusting is a sight to see. As soon as the sweeping is done, the long handled feather duster comes to the front. A whack here, and a bang there. The dust waltzes around and flies here and there, but never gets out of the room—only changes its place—and an hour afterwards you would never guess the room had been touched. I remonstrated with one of these strong-armed sweepers about sweeping without moving or covering anything. "Sure, haven't I got to dust all the same after I get through?" She emerges from the conflict with red face and tumbled hair, and declares "she is glad it is done."

MOTHER'S BOYS.

THE average schoolboy does not always imply a compliment when he describes a chum as his mother's boy. He is very apt to consider such a title an acknowledgement of effeminacy, though it is hard to tell why.

We must confess a personal weakness, however, for the boy who elects his mother as guide, philosopher and friend. True, a weakly-indulgent woman may warp and twist a boy's character, making him what we contemptuously term a Miss Nancy; but this is not so in every case, and some of the most thoroughly spoiled boys we have met were spoiled by their fathers, rather than their mothers. It is a self-evident fact that there can be no better influence in the building of character than that exercised by a woman of education and refinement. As an axiom, it may be stated that *every* mother should be educated and refined. Pity 'tis not always so.

The mother who has always a sympathetic word or look for her boy, in happiness and sorrow alike, can always be sure of his heart and allegiance. It is not always easy for us older folks to fully enter into a boy's feelings; but any want of interest we may show is always felt and often resented. So the mother who appreciates her son's prowess on the skating-pond, or his success in snaring suckers, will be considered just right, even if she does mingle a little firmness with her gentle rule.

The true mother's boy is not by any means a molly-coddle; he is a distinctly human boy, brimming over with fun and mischief, too, and coming to grief as often as other specimens of his race. But under his mischief and boyish pranks there is enough genuine chivalry to stock a regiment of mediæval crusaders. He is gentle to his mother and considerate to his sisters, and does not consider an evening spent exclusively in their society a barren waste. He waits upon his feminine relatives, like the little gentleman he is, and has even been known to give up an important engagement to go fishing with his chum because his mother needed his help. So he grows from the well-behaved boy to the man every one likes—a living encouragement to all mother's boys.

But there is one thing we are sometimes apt to forget. If we expect courtesy from a boy, we must return him in kind. Don't we all know the household where, if there is an irksome errand, some one says, "Send Johnny." If, when there are unexpected guests, the pie won't go around, "Johnny can do without." If the tea-table is crowded, "Johnny can wait." Poor Johnny! Who can blame him if he is not always as obliging as he might be?

If we treat our boys as little gentlemen, small doubt that they will behave as such. If we respect their feelings, they will respect ours. It is a fair system of give and take. So, dear mother, win your son's heart while it is still within your hand, and small doubt that your "mother's boy" will prove a crown of blessing.

WHAT SHALL THE CHILDREN READ?

IN these days this question cannot be too frequently asked, nor the subject too thoroughly discussed. As I call to mind the countless publications which are issued I exclaim, surely "of making books there is no end." And among so many, of course, some are good, some bad. It is for you, mothers and fathers, to decide whether your children shall read the good or the bad. Not that a child would necessarily select a bad book if left to make his own selections, but those books are bright and fascinating; the evil is presented in so charming a manner as scarcely to seem wrong; it is so cunningly interwoven with the good that to the inexperienced reader it is scarcely perceptible, but it will leave its impress upon the young mind, and bear fruit in later years.

This subject is one that has claimed my attention for years, and I've wondered that parents, careful in other respects, would allow their children to read anything and everything that comes in their way. Parents who are particular that their boys and girls should have proper food for the strengthening of their bodies, seem utterly careless with regard to their mental sustenance. Many who would be horrified at the idea of their children's seeking bad companions will thoughtlessly allow them to occupy their leisure hours with books of questionable morality. Victor Hugo says: "Books are cold but sure friends." If, then, your children are furnished with good books, these "sure friends" may be of inestimable value to them, but if you allow them to choose their own "cold but sure" companions, you may suddenly be aroused as was a mother recently, who said to me: "It nearly broke my heart to find my son, a lad of thirteen, reading a translation of one of the most corrupt French novels."

See to it, mothers, that your children read no books without your permission. If you could go still further and declare that they shall not look within the covers of a book, unless you allow them, it would be better still, for I remember, with sadness, a single sentence that I read as I picked up a volume from a booksellers' stand while waiting for a train. Beautiful thoughts, exquisite sentiments, which I've carefully read, have vanished from my memory, but that loathsome expression, which I glanced at hurriedly and carelessly, will, I fear, haunt me as long as I live.

And this oversight of children's books cannot be begun at too early an age, for pictures will leave an impression long before the printed page is read. In recognition of this fact D. Lathrop & Co. have published within a few years "Babyland," a monthly publication, for the youngest in the family. Many a little one has been charmed, and many a wearied mother rested as the bright and *wholesome* pages have been eagerly scanned.

But, after all, the most watchful attention is needed when the boys and girls first feel the delight of being able to "read for themselves." Then look carefully at the character of their "silent friends." And, as some perplexed mother may feel at a loss what to choose, mayhap a list of safe, good reading in the columns of the RURAL, from one whose business demands close attention to books, would prove helpful.

To begin, then, with children who have just learned to read. Be sure to have a paper or magazine especially for them; let it come to their address; make them feel it is all their own. I know of nothing better in this line than "Our Little Men and Women"—a monthly at $1 per year, containing large and beautiful pictures, short and instructive stories and delightful poems. Many of the papers for children are adapted to various ages, but this is specially for the beginner, and finds a hearty welcome from every little "man or woman" who is so fortunate as to receive it.

Then there are Mrs. Brine's books, always pure in tone—"Four Little Friends," "Papa's Daughters," "Jingles and Joys," the "Prudy" books, the "Flaxie Frizzle" series, by Sophie May. Those charmingly illustrated books, "Told in the Twilight" and "Out of Town," by Weatherby, and others included in the "Art Gem Series." Hans Andersen's wonderful stories are of world-wide reputation.

To those who think that the babes need some "strong meal" as well as "milk," there are histories of France, England, Germany and the United States, written in words of one syllable, by Mrs. Helen Pierson, and "Little Arthur's History of England and of France," by Lady Calcott.

Is Sunday reading or religious instruction demanded? There are the old-time favorites, "Peep of Day," "Line upon Line," "Precept upon Precept," which have recently been republished. There is the "Picture Bible for Children," the "Dawning" and the "Day Spring."

The list might be extended indefinitely; but surely one can select enough from this to furnish a child with reading matter for two years. Don't have too many books for the children. Require them to read, review and re-review. Should they declare they know them "all by heart," test them. Let the mother take a volume and have the children tell what they know of the first dozen pages. She will find a new interest aroused. The boys and girls will be ambitious to remember what they read, and be able to tell others about it.

And just a word here as to the training of children to take care of books. If they are made to look upon them as "friends" they will be careful in their treatment of them. No shabby volumes with broken or soiled covers and dog-eared pages will be visible. Furnish each little one with a set of book-shelves. These may be bought at a trifling expense or be "home-made," or allow them to use the lower shelves in the library proper. Then require them to replace each book after using, in a proper position. Let some penalty be attached, some privilege forfeited should the order be disobeyed. Habits of order and neatness will then be formed.

I remember the evident pride which a little friend manifested as I visited her father's library. Pointing to the lowest shelf, "Those are Jack's books. He hasn't many because he has just begun to read. Those on the next shelf are mine—all the books I have had since I was seven years. I'm nearly ten now and I have forty books. The third shelf belongs to Agnes. She is almost thirteen and has *ninety-seven books*. Only think! Nearly a hundred. We have to dust them and keep them nice."

Have your children gone beyond the "just beginning" stage. What myriads of volumes stand ready for their eager brains.

RHODA LANDER.

GOLDEN GRAINS.

PAUL H. HAYNE in Harpers:

Is happiness a plant of mortal birth,
Which, shrewdly cultured, grows in gracious earth?
Rather a heavenly glory, or bright dew,
Slipped from the bosom of the cloudless blue,
On some fair morning, to the soul's surprise,
Fresh with the fragrance born in Paradise.....

There is no soul without its "Hush!"
Life has surcease—
Sweet restful pauses, when we hear
Some wondrous voice, low, sweet and clear
Life hath surcease—
Calm, holy hours, when we are "still,"
And hush our souls to all God's will,
In perfect peace.....

HOLMES says: The best of a book is not the thought which it contains, but the thought which it suggests, just as the charm of music dwells not in the tones, but in the echos of our hearts.....

AN exchange says; One of the chief causes of the repugnance of many worthy people to what goes under the name of "society" is the accumulation of false smiles, false speeches and deceitful usages of all kinds which flourish in fashionable circles under the mistaken notion that they are a polite necessity.....

THE man or woman who is discovered to be actually honest in deportment and expression forms a center where the standard is planted and around which everything that is worth saving makes a gallant fight for existence. It is notable how soon the vivacious, the frank man or woman inspires confidence amongst those who lack the impulse or the courage to fall into line with truth.....

To be sincere does not imply rudeness. It is compatible with the most delicate tact and address, and may coexist with all the graces. All that sincerity asks, so far as social life is involved, is that men and women do not put themselves to trouble, to be false and makes an environment of small deceits a necessary concomitant of the act of meeting together for social purposes. Be graceful and be courteous, but above all be sincere.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

Nothing should be bought which is considered too fine for the fullest domestic appropriation. Far better is the plainest furniture, on which the children can climb, than satin and damask which must be viewed with reverence.

A BREAKFAST FOR SIX.

"We'll feast each other ere we part."

Codfish Cakes.
Rissoles of Chicken. Savory Potatoes.
Fricasseed Eggs. Muffins.

Codfish cakes are very much like the little girl in St. Nicholas:

"When they're good, they're very, very good,"
And when they're bad they're horrid."

They not only seldom are so good as they might be, but they generally are much more "horrid" than is necessary. Now for the good kind.

Buy a pound of the so-called "boneless codfish," choosing a thick cut from the center. It must be white and free from suspicion of taint; after having soaked it for an hour in lukewarm water, pull it in pieces and put it over the fire in cold water, letting it stand where it will come to a boil slowly. As soon as it reaches the boiling point, take it off, taste it, and if not sufficiently freshened, pour off the water, cover again with cold water and let it heat slowly. If allowed to boil it will be tough. Drain, press dry, and pull in shreds, picking it until it is light and fluffy. There must be no lumps or coarse pieces in these model codfish balls. Add an equal bulk of hot mashed potatoes, that have been carefully prepared after a recent RURAL recipe, butter the size of an egg, one beaten egg and pepper to taste. Beat these ingredients until they are all thoroughly mixed, and mold into flat cakes or little round balls. If these are for breakfast, it is a good plan to make them at night while the dinner dishes are being washed. Fry quickly in a little hot butter or sweet dripping; I do not like lard for this purpose. They are often fried by immersion in boiling fat, but this is not always convenient in a small family, where quantities of fat for frying purposes are seldom on hand. Half of the above quantity will be sufficient at a breakfast where other courses are to be served, but the remainder makes a nice and cheap little fish course for a family dinner.

A few tablespoonfuls of cold roast or boiled chicken may be served up as follows: Mix it with a third of the amount of tongue or ham; all should be minced finely; put a tablespoonful of butter in a saucepan, stir in as much flour, and when it thickens add the minced meat; moisten with a very little stock or cream, season with pepper and salt (if the latter is necessary), a little lemon juice, and a trifle of nutmeg. Remove from the fire, and stir in the beaten yelk of an egg. Now make a paste with two beaten eggs, a gill of water, a pinch of salt, another of sugar, and flour enough to enable you to roll it out. Stamp in round pieces with a cutter three inches in diameter. When the mince has cooled, put as much on each piece of paste as can be folded up neatly: fasten the edges by brushing them them over with cold water. Brush each rissole over with beaten egg, and fry by immersion in hot fat.

Put six hard-boiled eggs in cold water as soon as they are done, and when cold cut them cross-wise; take out the yelks, slice a bit from the bottom of each of the white halves, standing them close together in a flat dish. Rub the yelks to a paste with a tablespoonful of melted butter, one of cream and two of bread crumbs. Fill the whites of the eggs with this mixture, pour over them a little chicken stock or gravy, and set in the oven for five minutes.

Slice a pint of cold boiled potatoes and simmer them for ten minutes in a little gravy or stock; add a bit of butter, a little minced parsley, such seasoning as may be necessary, and serve very hot.

The nicest of muffins are made from one small yeast cake dissolved in a cup of warm water; add two cups of milk, and flour enough to make a stiff batter. The next morning add one beaten egg, a tablespoonful of melted butter, a teaspoonful each of salt and sugar, and bake in buttered gem pans.

A nice breakfast is never complete without stewed or fresh fruit of some kind; the latter is generally served before the meal.

PALMETTO.

THE author of "John Halifax, Gentleman," who has pictured so beautifully in her novel the wise, economical wife and mother, gives, in Harper's Bazar, the very practical advice that every girl who is not entirely dependent on her male relations ought, by the time she is old enough, to know exactly how much she has, where it is invested, and what it ought yearly to bring in. A person who is careless about money is careless about everything and untrustworthy in everything. Yet there is such a thing as ignoble economy, as well as noble extravagance. She who stints her servants in food and wages, who goes shabbily clad when her station and her means require her to be dressed at all points like a lady, is deserving of the severest blame. Money is meant not for hoarding, but for using.

"THE PRETTIEST LITTLE PARLOR."

I AM very fond of young people, and never so happy as when I am listening to their joys, or comforting them in their sorrows. My friends say I am an inveterate match-maker: perhaps because my own life has been a hard and lonely one, I am the more anxious that the lot of others in whom I am interested should be brighter. For some reason or other, young people all confide in me. I am "Auntie" to many, and "Mamma" to not a few. If Lois is fickle, or Jack is proud, somehow the trouble is always brought to me, and bearing in mind the sad mistake of my own life, I am often able to calm the troubled waters and make peace between them. So the other day when pretty Lois came to me, all smiles and tears and blushes, to tell me that she and Jack were going to prevent any future misunderstandings by joining their lot for all time, I had not the heart to point out to her that married people quarreled quite as often as lovers, trusting to her own loving heart and Jack's sturdy good sense to prevent this in her own case. We talked instead of the little parlor that must be cheaply furnished, and of how we could make it attractive at the least possible cost.

Since it was to be in the country, we agreed that rural simplicity should be the order of the day, and a matting was the first thing decided upon. It is always best to get the best quality of India matting, which sells for 75 cents a yard and is seamless. By a little time spent in judicious shopping, however, one can always buy remnants at half price, and as there is no time like the present we put on our bonnets and sallied forth in search of it. We found a piece, or rather two remnants, at 40 cents a yard, of excellent quality, with the cream-colored monotony relieved by a narrow stripe of dark red at wide intervals. There were nearly twenty-two yards which the obliging shop-keeper called twenty, and sold for $8. A durable and really artistic library table was chosen at $15. For the rest of the furniture we went direct to the manufacturers, and chose a couch, wide and low, and two big, stuffed easy chairs of different designs; as we took these without any covering except the muslin one, and as they were intended to be entirely upholstered there was no costly carving about them, and the cost was only $15. These we upholstered ourselves with loose covers of pretty cream-colored cretonne closely covered with deep cardinal flowers and trailing vines in browns and old gold, making three large, soft pillows for the couch, one for the head and two for the back. Two light chairs and a wicker rocker were also added.

One corner of this parlor Jack, who is skillful with tools, is going to fit up in the following manner: A triangular seat, the hight of an ordinary chair, is to be fitted in, stuffed with excelsior, covered with a layer of wool, and the whole tacked down and covered with coarse unbleached muslin. This is to be covered with cretonne, letting a ruffle of the same descend to the floor. Two pillows are to be covered with the same and placed against the wall. A piece of gilt molding is to be placed against the wall, to match the shape of the seat below, and from this is to be draped a pair of Madras curtains like those at the windows, looped back with ribbons in cardinal and plain gold.

A SPINSTER.

"BENEDICK, THE MARRIED MAN."

SOME time since the RURAL published an article entitled "Woman's Unnecessary Work," in which I criticised (not unjustly, I think) over-industrious women; but a letter that I have just received, forwarded to me through the RURAL, shows me that all persons do not think alike. Although the letter is signed "Vindicator," I judge that my correspondent is a woman, in spite of the masculine affix, both from the fact that she has taken up the cudgel in defense of the weaker sex, and because the letter savors considerably of injustice. A lady writer of much note, speaking of her own sex, says: "We are often tenderer than our brothers, but not usually so just."

I must admit that "Vindicator" shows much penetration when she expresses her opinion that I never had a husband of my own. I am bound to confess that, under the decrees of an all-wise Providence, whose wisdom in the matter I have never for a moment doubted, I never had. Perhaps, for this very reason, however, I have had better opportunities to study "other women's husbands," and I have not found them all bad specimens.

A few months ago I received a letter from a dear school friend whom I had not seen since her marriage ten or more years ago, telling me that she needed rest and change, and was coming to San Francisco for a couple of weeks in search of both, at the end of which time I was to accompany her home. I found my poor friend sadly changed, with the sad drawn lines in her face, that tell of insomnia, that terrible disease that fastens itself upon so many great thinkers and writers. Although a graceful writer, whose name is well-known in the literary circles of California, she had never devoted herself to her work with such assiduity as to endanger her health, and consequently the cause of her illness remained a mystery to her physician and friends. In this case its worst feature seemed to be a maddening sense of the eternal sameness and routine of things. With an artist's love of the beautiful, and an extremely sensitive nature, it was a peculiar phase of her disease that the very pattern of the wall paper had become a source of torture from the fact that her eyes had rested on it for so many years. We tried the usual routine of trips to Monterey, San Rafael, Angel Island; sought every spot where health-giving mountain or sea breezes were supposed to loiter, not forgetting that resort of every loyal Californian, the Cliff House; but without producing much effect in the way of healthful sleep. For some reason that was to remain a secret she had been forbidden to return home before the two weeks were over, but at last the letter came recalling her. As we neared the house I noticed a bewildered look on the face of our dear invalid, which was explained by her exclamation of "What can Tom have been doing? Our house used to be white!"

Whatever "Tom" had been doing, he certainly had shown much taste in painting his house the darkest of olive green with just a line of Indian red here and there, the whole effect restful to the eye. As we entered the tiny hall and passed into the parlor, bewilderment deepened to amazement. Not one familiar object was to be seen. The room had been re-carpeted and re-furnished; the very engravings on the walls were different. This transformation extended through the entire house, and in the dining-room, the daintiest of feasts and a few chosen friends awaited this idolized wife.

But it was in my friend's own room that the acme of thoughtfulness had been reached. A large bay-window had been added to give increased light and cheerfulness, the carpet was of mossy greens interspersed with Lilies of the Valley. Great crimson poppies on a gilt background covered the walls; the ceiling was papered to represent night, and twinkled with innumerable moons and stars. I saw at once that the poetical nature of my friend appreciated this pretty idea of a poppy-covered wall in her sleeping room, and did not doubt that all this change, together with the pillow of poppy leaves that had been provided, would bring "Nature's sweet restorer," to her weary eyes once more.

This of course is only *one* "Other Woman's Husband," and I fear that he is somewhat of a *rara avis*, but, although such devotion in a husband after fifteen years of married life, is not frequently found in all conjugal differences, there are two sides to the question. The ease with which divorces are obtained in this country, where, as Charles Reade says, "they allow you five minutes at a railway station to get a divorce," has probably much to do with the unhappiness of married people. Young people, while they may not contemplate the possibility of a divorce on their wedding day, still have a feeling that the marriage is not necessarily for life.

Swift said: "The reason why so few marriages are happy is because young ladies spend their time in making nets, not cages."

NO MAN'S WIFE.

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your grocer for Dixon's big cake.

Vitality and Color

Are restored to weak and gray hair, by the use of Ayer's Hair Vigor. Through its cleansing and healing properties, this preparation prevents the accumulation of Dandruff, and cures all scalp diseases.

When I commenced using Ayer's Hair Vigor my hair was weak, thin, and gray. My scalp was also full of dandruff, and itched incessantly. Two bottles of the Vigor removed the dandruff, stopped the irritation, restored my hair to its original color, and so stimulated its growth that I now have an abundance of long black hair. The occasional use of this remedy keeps my hair and scalp in perfect condition.—Florence J. Cannon, 759 Clinton st., Trenton, N. J.

Ayer's Hair Vigor

is, in every respect, the most cleanly of all preparations for toilet use.

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass.
Sold by all Druggists and Perfumers.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

"I NEVER!" Ladies, we make a specialty of giving Premiums for the forming of Tea Clubs. Now is the time to get up orders for our celebrated TEAS and COFFEES. Teas of all kinds, from 30 to 75 cts. per pound. We defy the world on price and quality. No house can give the same quality of goods and premiums as we do. We have a host of useful and ornamental articles to select from. Send us your address (mention this publication) and we will mail you our Illustrated Price and Premium List, and full particulars. Address NATIONAL TEA & COFFEE CO., Washington St., Boston, Mass.

PURE MILK.

WARREN MILK BOTTLES
Patented March 23d, 1880.
Adapted for the Delivery of Milk in all Cities and Towns.
A Long Needed Want at last Supplied.
DESCRIPTIVE CIRCULARS ON APPLICATION.

News of the Week.

HOME NEWS.

SATURDAY, September 4, 1886.

LAST Tuesday night between 9.15 and 9.45, an earthquake was felt more or less severely in most parts of the country from Canada to the Gulf, and from the Atlantic to the Pacific. The shocks were much less violent in the North than in the South, and culminated at Charleston, S. C. There were several shocks there; but the first did the greatest harm. The first accounts reported over 100 deaths, but the latest accounts lower the number to between 40 and 50; but nothing definite is yet known. Two-thirds of the city have been destroyed, and most of the buildings left standing are considered insecure. The damages are estimated all the way from $8,000.000 to $10,000,000. Families sleeping in the streets. Much destitution. Intense suffering. Several neighboring villages destroyed or damaged..... ...

..The Indiana Republicans, at their State Convention at Indianapolis Thursday, went in for local option and high license. Yesterday's telegraph says a notable feature of the convention was that so many of the delegates were big men physically—tall, broad-shouldered, solid fellows from the farm..... The anti-saloon movement is gaining great strength among Republicans, who feel that unless they take a very decided stand against rum-sellers, the party will lose so many of its best adherents as to be pretty certain to meet defeat at the polls. It is in a delicate position; if it strongly opposes the rum-sellers it will lose heavily on one side; if it doesn't do so, it will lose heavily on the other. In some few States, especially in the South, the Democrats are in the same dilemma, but the Republican party being the "party of high moral ideas," is likely to suffer most by the defection of Prohibitionists.....Canadian vessels are not allowed to go from one United States port to another to get cargo. Canada has just enforced a similar rule against American vessels, and lake ship-masters are howling.....Two other American fishing vessels have been seized by the Canadians within a week, making 13 in all. All, except the last, have been released on the deposit of $400 each by the owners or the U. S. Consuls at the ports of capture. The right to the fine will be decided by the Canadian Courts, but it is generally thought the decision will be against the owners, but the Imperial or Dominion Government may afterwards remit the fines, should a satisfactory treaty be made. Our Prof. Baird is experimenting on a newly invented process for preserving fish; with a view of preserving bait so that our fishermen may be independent of the Canadians in this particular. If it proves successful, it will be of vast importance in other ways also.....As Congress is not sitting, news is scarce, and the papers are filling up their yawning columns with long yarns about the sea serpent, which has been lately seen by large numbers of "credible witnesses" from Savannah to Cape Cod. One is supposed to be up the Hudson River now. He's enormous—from 25 to 250 feet as far as seen, "round like a barrel," with head uplifted from 5 to 25 feet out of the water..... Prof. Calvin Stowe, the long-time ailing husband of Harriet Beecher Stowe, died at Hartford, Conn., last week.....There's likely to be a long and bitter freight and passenger rate fight between the great Western pool railroad lines, as the Baltimore and Ohio has been cutting rates in revenge for an attempt made by the Pa. Road to shut it out from New York.....The American Purchasing and Leasing Company includes all the distilleries north of the Ohio, and began operations Sept. 1. It is increasing the capacity of the distilleries about 30 per cent., in spite of the Prohibition agitation..... ....At Englewood, near Chicago, three Know Nothing lodges, with 300 members, have just been discovered, and local politicians are angry and perturbed..... The Mississippi River has not been lower in years than it has been this Summer. A few days ago a man on horseback forded it near Galena, Ill., where usually the river is three-quarters of a mile wide. The deepest water he found was in the channel, and there it was but a trifle over two feet deep.....Mormon apostles very troublesome about Spartansburg, S. C. Probably there will soon be lynching or tar-and-feathering "outrages" in that section, just as in Tennessee and Georgia a short time ago....Monday the Knights of Labor, of Hamilton County, Tenn., in convention at Chattanooga, nominated candidates for the State Senate and House—the first action of the kind taken by the order in the South. The K. of L. are going heavily "into politics" elsewhere, however.....No, the Government telephone case is not dead. The arguments against the Bell Telephone Co., will begin at Columbus, Ohio, on Sep. 20, and the Government's case will be presented by Messrs. Thurman, Lowery and Chandler. .....Not including the Post Office or the War and Navy Departments, $12,893,476 are due the Government on account of defalcations and improper disbursements since 1861.

PARTICULAR attention is called to the list of journals with which the RURAL NEW-YORKER clubs. Any of our readers who desire to subscribe for any of these papers in connection with the R. N.-Y. are promised that their commands shall receive careful and prompt attention.

AGRICULTURAL NEWS.

SATURDAY, Sept. 4, 1886.

THE Fourth Annual Exhibition of the National Horse Show Association of America will be held in Madison Square Garden, New York, during the first week in November, beginning on Monday, Nov. 1. Prizes to the amount of $16,135 have been offered. Of this amount $11,765 are for first prizes, and $4,370 for second. The total amount includes special prizes valued at $1,800. The highest regular prize is one of $500, which is offered for the best trotting stallion shown, with four of his get. There are 99 regular and 9 special classes. Prizes are given for Thoroughbreds, Arabs, trotters, heavy draught horses, Clydesdales, Normans, coaching stallions, carriage horses, tandems in harness, four-in-hand teams in harness, cobs in harness, ponies in harness, horse and cab, saddle horses, cobs, ponies, hunters, fire-engine horses, police horses, cavalry horses, and donkeys and mules. The association has expended in prizes in the past three exhibitions $30,635. In 1883 there were 391 animals shown, in 1884 382, and in 1885 444. Entries for this year's exhibition will be closed on October 12. Forms of entry can be obtained from Secretary, W. F. Wharton, at No. 48 Broad Street.....During the last few months a new industry has sprung up in the Canadian Northwest—that of shipping hogs to Eastern points. In one day recently nine cars, seven for Toronto, and two for Ingersoll, left Winnipeg. The hogs are gathered up from farmers all over the province, and command good prices.....The total exports of wheat from the Atlantic ports this year, between January 1 and August 7, were 31,246,000 bushels, against 21,822,000 bushels for the corresponding period last year. The exports of flour for the same period are 4,461,000 barrels this year, against 4,443,000 barrels last year. Our foreign wheat trade is by no means dead yet, in spite of the antics of speculative gamblers..... .....

..The celebrated orchid "Vanda Lowi," which was purchased by William S. Kimball, at the great Morgan sale in New York, is now in bloom at his gardens in Rochester, N. Y. The orchid is the only one of the variety ever brought to this country, and cost Mr. Kimbals $12,500. It has been in bloom only once before, at the botanical gardens in London, where Mrs. Morgan purchased it.....

....At a conference of the cattle dealers of Ireland, in Dublin, a week ago, it was stated that the depression has lessened the value of stock £20,000,000, or $100.000,000.....

..Last week Milwaukee warehouse men made the charge for storing wheat a year 11½c. per bushel instead of 15 cents—the rate till then. The reduction amounts to one-third during the seven summer months, and other concessions are also made..A herd of imported Aberdeen-Angus cattle belonging to Andrew Allan, of Montreal, Canada, valued at $1,200 each, has been destroyed at Montreal as affected with pleuro-pneumonia. The government pays two-thirds of the value of cattle thus slaughtered to prevent the spread of the disease; but the amount per head must not exceed $50, however great the value upon stock. Some of those slaughtered in quarantine the other day were worth $2,000 and over.....The orchard fruit crop of Scotland is this year a complete failure. The almost continuous frost and snow of May and June ruined the crops of apples and pears, Small fruits, an average yield; but there, too, prices have been very low.

....An official call has been issued for a general gathering of the millers of the country at Minneapolis, September 13 and 14.....Two bales of new English hops, the first received here this year, were sold Thursday at 40 cents per pound.....The Government silk station in Piedmont, S. C., was lately sold by order of Commissioner Colman. Meanwhile Congress has voted $15,000 more for another year's fooling with silk-worms.....Reports of frosts from several parts of Iowa and Dakota have tended to raise the price of corn, through fear of early damage to the crop. No injury yet reported..... ...

AMERICAN HAY PRESSES ABROAD.

RECENT advices from South America state that the "Inter-National Rural Exposition" of Buenos Ayres, has awarded the Whitman Hay Press the First Prize over a large number of competitors. This is but an additional honor to the Whitman Agricultural Company, of St. Louis, who, we are informed, have received the First Prize at every Fair, Exposition and Trial where they have exhibited their "World Renowned Rebound Plunger Hay and Straw Press." Farmers or others who are in need of Hay Presses will do well to communicate with the above Company.—*Adv.*

Crops & Markets.

SATURDAY, Sept. 4, 1886.

The Mark Lane Express, in its weekly review of the British grain trade, last Monday, said: The week's splendid harvest weather has materially altered the position. Much grain has been secured. The crop in early sown districts is in fine condition, while late sown crops are rapidly maturing. Another week's sunshine will probably cause a big drop in prices.

A cablegram from Vienna, Austria, on the same day says: The harvest reports for Austria-Hungary, show that the yield of wheat is from 5,500,000 to 6,000,000 hectolitres below the average; the yield of grinding barley 5,000,000 hectolitres below the average, and of rye 3,500,000 hectolitres below the average. There is a medium yield of malting barleys and oats. The only grain available for export is malting barley, to the amount of 2,500,000 or 3,000,000 hectolitres. A hectolitre is 2.82 or 2 4-5 bushels.

A cablegram from Sidney, New South Wales, on the same date, says: The harvests of New South Wales are very promising. The best yield since 1870 is expected.

It is estimated that the wheat crop of California will be worth $54,000,000 this year, as against $28,000,000 last year, and that the barley crop will fetch $16,000,000, a gain of $7,000,000 over last year. The area sown is said to be but a fraction larger than in 1885. Recent estimates place the wine crop at $18,000,000, instead of the $25,000,000 estimated earlier in the season. Last year's crop was $15,000,000.

The Charleston Courier says that the reports from the crops continue to be good for both upland cotton and rice, but in the Sea Island section caterpillars are reported on nearly every plantation.

CIGAR leaf tobacco promises to be a more remunerative crop this season than for several years, judging from the reports made to the New England Homestead by 500 special correspondents, covering the seed leaf districts of the entire United States. The Connecticut and Housatonic Valleys take the palm for quality and yield, producing 1,500 to 2,000 pounds per acre of Havana seed leaf and 1,600 to 2,000 pounds of domestic seed leaf. The acreage has been reduced fully 15 per cent., but the yield, being 200 pounds per acre more, will make a total product fully as large as in 1885. On the whole, the season has been singularly favorable, hail and wind having done damage only in small streaks, injuring less than five per cent. of the crop in the two valleys, while insect pests have been few, and "calico" or mottled plants, which in some years give the crop an uneven value are this year notable by their absence. As a result, an unusually large percentage is wrapper leaf, and higher prices are expected—from 10 to 20 cents per pound, against 7 to 15 cents last year.

Less than 15 per cent. of the 1885 crop is in growers' hands, being held at 10 to 25 cents, a larger proportion being held in Franklin and Hampshire Counties in Massachusetts than elsewhere. There is an increased proportion of Havana, except in the famous Connecticut seedleaf district of East Hartford, South Windsor and vicinity, where the crop is a marvelously fine one in all respects. The tobacco which was harvested is curing down fine in texture. Onandaga County section of New York has a lighter yield (1,000 to 1,400 pounds) and less acres than last year, but the quality is very fine. Ten cents are offered for the new crop, but 15 are asked. What little old is held is worth 12½ cents. The Big Flats or Chemung Valley has about 1,600 acres, the same as last year, of 10 per cent. poorer quality and 8 per cent. lighter yield per acre. Growers have upward views as to prices. Pennsylvania reduced its acreage about 10 per cent., but the yield is nearly 200 pounds per acre more than in 1885, being 1,300 pounds of Havana and 1,500 pounds of seed leaf. The total product is 80,000 cases, against 75,000 cases last season. The seed-leaf counties of Southwestern Ohio have increased 10 per cent, mostly Little Dutch. The quality is somewhat better than that of the '85 crop. The crop in Wisconsin and adjoining counties in Illinois is light and uneven beyond all precedent. The low prices of last year led to a reduced acreage, but owing to the June and July droughts, thousands of acres prepared for the crop were not planted to tobacco, and large areas that were set almost totally dried up. What has survived is very uneven and will require good weather until October to mature it. Some of the early set, however, is very nice, where it has escaped the hail, which on August 21 largely damaged what tobacco had survived in the famous Janesville region. Elaborate returns from every tobacco town in the State show that the average of merchantable tobacco on August 25 was only one-third as large as last year, probably yielding an average of 856 pounds to the acre, against 1,112 in 1885. The crop of this whole section is, therefore, placed at 26,000 cases, against 80,000 cases last year, and 54,000 cases in 1884. Growers and local buyers talk strong prices for good crops, 10 cents through having been refused, and 20 cents mentioned, while but little old is held at higher prices. It is quite likely that good 1886 leaf will bring somewhat better prices than last year, when the crop sold at such low prices, and that dealers should be able to realize on it readily with a good cure. The 1886 wrappers will do much toward supplanting the Sumatra leaf.

BEAR in mind that the RURAL never *sells* its premiums. We give them as payment for work. We will not, under any circumstances sell them for cash. The RURAL sells nothing and hence is not bound to praise any implement or plant except as it deserves praise.

MARKETS BY TELEGRAPH.

SATURDAY, Sept. 4, 1886.

CHICAGO.—Compared with cash prices a week ago, regular wheat is 1½c. higher. No. 2 Spring, 1c¼. higher. Corn, ½c. lower. Oats, 1c. lower. Rye, 1c. lower. Barley, 1¾c. lower. Flaxseed, ¼c. higher. Pork, 70c. higher, and there is proportionate rise in "futures. Cattle, from 5c. to 35c. lower. Hogs, from 5c. to 40c. higher. Sheep, steady.

WHEAT active.—Sept., 76@76¼c; October, 77¾@78¾c; November, 79¾@80½c; No. 2 Spring, 76½c. CORN quiet! Cash, 41¼c; September, 41@41¾c, closing at 41¼c; October, 42¾@43¼c; November, 43¾@44¼c. OATS.—Steady! Sales ranged: Cash, 25¾c; September, 23¾@23¾c; October, 27¼@27½c. RYE.—Quiet; No. 2, 49c. BARLEY.—Firm, No. 2, 58½c. FLAXSEED.—No. 1, $1 10@1 10¼. MESS PORK.—Firmer; Sales ranged: Cash, $10 20@$10 25; September, $10 20@$10 25, October, $10 12½@$10 40; November, $10 00@$10 20. LARD.—Firm; Sales ranged: Cash, $7 47½; September, $7 52½@7 50; October, 6 87½@$6 90; November, $6 60. Short Ribs.—Steady; Cash, $6 60. Boxed Meats.—Dry salted shoulders, $5 75 @5 87½. Short clear sides, $6 60@6 65. CATTLE.—Market strong; Shipping steers, $3 50@5 00; stockers and feeders, $2@3 50; cows, bulls and mixed $1 50@3 40; bulk, $2 25@2 50; through Texas steers, $2 70@3 60. HOGS.—Market strong; Rough and mixed, $4@4 58; packing and shipping, $4 30@$5 10; light weights, $3 75@4 85; skips, $2 40@3 60. SHEEP.—Natives, $2 00@4 00, Texans, $1 75@$2 75; Lambs, $4@5.

ST. LOUIS.—Compared with cash prices a week ago, No. 2 red wheat is 1⅞c. lower. Corn, 1½c. lower. Oats, 1c. lower. Rye, 1½c. lower. Butter—Creamery steady; dairy from 2c. to 5c. higher. Eggs steady. Flaxseed unchanged. Pork, 50c. higher. Lard, 50c. higher. Cattle from 5c. to 15c. higher. Hogs from 10c. to 20c. higher. Sheep—Lower grades steady; best kind good figures.

WHEAT.—Active; No. 2 Red, Cash, 77¾@77¾c; September, 77¾c; October, 79¾@79⅞c. CORN.—Dull; No. 2 mixed, Cash, 31¼@31½c; September, 31½c; October, 33c. OATS.—Firm; No. 2 mixed, Cash, 25¾@26c Sept, 25c.; October, 26¾c. RYE.—Sept, 50½c. BARLEY—No market. BUTTER.—Creamery, 18@22c; dairy, 15@20c. EGGS, 12c. FLAXSEED.—$1 06. HAY.—Timothy, $10 00; Prairie, $8 00. PORK, $10 75. BULKMEATS.—Long clear, $6 60; short ribs, $6 60; short clear, $6 80. Lard, $6 75. Receipts: Flour, 2,000 bbls. CATTLE.—Market active; Good to Choice Native Shipping Steers, $ 4 30@4 75; Common to Fair, $3 50@4 25; Butchers' Steers, $3 50@4 00; Cows and Heifers, $2 25@3 35; Stockers, and Feeders, $3 25@4 00; grass Texans, $2 25@3 60. HOGS.—Market firm and active; heavy, $4 90@5 10; Packing, $4 35@4 85; Lights, $4 40@4 60. SHEEP.—Market firm at $2 25@4 25.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, September 4, 1886.

STATE OF THE MARKET.—As compared with cash prices last week, flour is 5c, lower; ungraded Red Wheat, 1c, higher; No. 2 Red, ¼c, lower. Corn, ungraded mixed, ½c, lower; No. 2, ¼c. higher. Oats, ¼c. lower. Pork, 25c. higher. Butter, 1c. to 1½c. higher. Cheese, 2c. to 2½c. higher. Eggs, ½c. lower. Fruits and vegetables steady.

FLOUR, FEED AND MEAL.—FLOUR—Quotations: Fine $2 00@2 60; Superfine, $2 25@3 00; Extra No. 2, $2 65@3 25; Good to Fancy Extra State, $3 30@3 70; Common to Good Extra Western, $2 70@3 70; Good to Choice Extra Western, $3 90@4 70; Common to Fair Extra Ohio, $2 70@3 75; Good, $3 80@4 30; Good to Choice, $4 25@4 75; Common Extra Minnesota, $2 65@3 00; Clear, $3 25@3 75; Rye Mixture, $3 30@3 75; Straight, $4 00@4 60; Patent $4 40@5 10; Bakers' Extra, $3 75@4 50; St. Louis Common to Fair Extra, $2 65@3 65 Fair to Good, $3 70@4 50; Good to Very Choice, $4 55@4 90; Patent Winter Wheat Extra, $4 25@5 00; City Mill Extra for West Indies, $4 40@4 55; South America, $4 60@4 70. SOUTHERN FLOUR.—Common to Fair Extra at $2 85@3 60, and Fair to Choice, $3 65@5 00; Patent, $5 25. RYE FLOUR.—Superfine, $3 20@3 40. CORN MEAL.—Yellow Western, at $2 50@2 75; and Brandywine at $2 80@2 95.

GRAIN.—WHEAT.—No. 2 Chicago at 87c; No. 2 Milwaukee, 87¾c; No. 1 Hard, 92c; No. Northern, 90c; Ungraded Spring, 75c; Ungraded Red, 84@90c; No. 3 Red, 86@86¼c; Steamer No. 2 Red, 86c; No. 2 Red, 87¼@87¾c; No. 1 White, 89c; 2 Red, for September, 87¼@87¾c; do. for October, 88¼@89¼c; do. for November, 90¾@90¾c; do. for December, 91¾@92c¼; do. for January, 93¾@93¾c; do. for February, 94¾@95¼c; do. for May, 98¾@99 1-16c. CORN.—Ungraded Mixed, at 50¾@52c; No. 2, 51@51¼c; No. 2 for September, 51¾@51¼c; do. for October, 51¾@51¾; do. for November, 52¾@52¾c, do. for December, 53¼c. OATS.—No. 3, at 31¼c; do. White, 34¼c; No. 2, 32½c; do. White 35¾@35c; Mixed Western, 32½@33c; White, do. 36@41c; White State, 38c; No. 2 for September, 32¼@32½c; do. for October, 33@33¾c; do. for November, 34@34¼c.

PROVISIONS.—PORK.—Mess, quoted at $10 50@10 75 for Old and $11 00@11 25@11 50 for New; $13@$14 for Family Mess; $18 75@15 00 for Clear Back; and $9 25@10 25 for Extra Prime. BEEF.—Extra India Mess, $11 50@13; Extra Mess, in barrels, $8 00; Packet, $8 50; Plate, $8 50. BEEF HAMS.—Quoted at $23@23 50 for new. CUT MEATS.—Pickled Hams, 12 lb average, 10¾c; Loose Green Hams, 9½c; Pickled Shoulders, 6@6½c; Pickled Bellies, 12 lb average 6½c; City Pickled Shoulders, 6@6¼c; Smoked Shoulders, 7¼c; Pickled Hams, 10¾@11¼c; Smoked Hams, 12@12½c. MIDDLES.—Long Clear in New York quoted at 6.75. DRESSED HOGS.—City Heavy to Light at 6¼@6¾c; Pigs, 6¾c. LARD.—Western steam spot, at 7.37½@7.45c; September, 7.47½c; October, 7.12@7.22c; November, 6.92@6.05c; December, 6.90c.

BUTTER.—Creamery—State, pail, fine, 23@23½; do Pennsylvania, tubs, 22@22½c; Western, best, 22c; do prime, 20@21c; do. good, 16@17c. State Dairy, pails

choice, 21@22c; half-firkin tubs, about prime, 18½@19½c; half-firkins, tubs, good, 16@17c; half-ferkins, common, 13@14c; Welsh tubs, best, 18@19c; do. do. prime, 17c. Western Imitation Creamery, best, 14c; imitation creamery, fair and good, 12@13; Dairy, fine, 13@14c; do, common, 10@11c; Factory, fresh, 12@13c; do. good, 11@12c.

CHEESE.—New State factory, best, 9¼@9½c; do, do, fine, 8¾@8¾c; do, do, fair, 7¾@8c; do, do, common, 7@7½c; Ohio factory, fine, flat, 7¾@8c; State factory, night skims, 6@7c.

EGGS.—State, 16½@16¾c; Western, 15½@15¾c; Canadian, 15½@15½c.

BEANS.—Marrows, $1 65@1 70; mediums, $1 50; peas, $1 50; red kidney, choice, $2 00@2 10; white kidney, choice, $1 50@1 55; California lima, $1 70; green peas, $1 15@1 20.

POULTRY.—LIVE.—Chickens, spring, per lb, at 11@13c; fowls, near-by lots, per lb, at 11@12c.; fowls, Western lots, per lb, at 11@12c; fowls Southern lots, per lb, at 11c; turkeys, per lb at 9@11c; ducks, western per pair at 45@70c.; geese, western, per pair, at $1.00@1.37.

POULTRY.—DRESSED.—Turkeys, per pound, at 11@12c.; Spring chickens, Philadelphia, per pound at 17@18c.; do. western, per lb, at 13@14c; fowls, Pennsylvania, prime, per lb, at 13@13½c; do State and western, per lb, at 12@13c.

FRUITS.—FRESH.—Quotations: Apples.—Orange Pippin, per d-h bbl, at $1 50; do, open-heads, at $1@1 25; Gravenstein, per d-h bbl., at $2 00@2 50. Peaches.—At 30c.@$1 00 per basket for best; 50@60c. for plain per basket; do. extra per crate, $1 00@1 25; do. plain per crate, at 65@70c; Jerseys, best, at $1 00@1 25 per basket; do. good at 60@80c. per crate, and 80@80c. per basket. Pears.—Bartlett, Va., good to choice, bushel crate $2 50@3 00; do. fair, per bushel crate, at $1 50@2 00; do. Md., per crate, 75c.@$1 00; do. Clapp's Favorite, per bbl, $2 50@2 75. Grapes.—Niagara, South Carolina, per lb, 10@12c; Concord, Va., per lb, at 5@6c; other black varieties, N. C., per lb at 2@4c; Hartford and Ives, Va., fancy, per lb, 4½@5c. Plums.—Egg, upriver, per bbl, at $2 00; Damson, Md., per crate, 40@50c. Huckleberries.—Jersey, per quart at 2@4c; Jersey, per 8 to 12 quart box, 30@45c. Watermelons.—Georgia, prime, per 100, at $21@24; Georgia, poor to good, per 100, $15@19; South Carolina, good to prime, per 100, at $20@23; South Carolina, poor to fair, per 100 at $12@16; North Carolina, poor to prime, per 100, $10@16. Muskmelons at $2 00@3 00 for best per bbl.

FRUITS.—DRIED.—The quotations are as follows: Apples—Fancy evaporated, at 9c; do, choice, at 8½c; do. prime at 8c; fancy North Carolina sliced, at —; choice do, at 3½@3c.; choice Tennessee quarters at 1½@2c.; State quarters at 2½@3c.; southern sliced prime at 1½@1¾c. Peaches—Peeled North Carolina, choice, —c; fancy, —@—c; do. Georgia, choice, at —@11c; do. prime, —@—c; unpeeled halves 3@3¼c; unpeeled quarters at 2½@2¾c. Cherries, pitted, at 10@10½c. Evaporated raspberries, at 15@—c; sun-dried do. 13@14c. Blackberries—Prime at 8c.

PEANUTS.—Quotations are: 5½c. for best hand-picked; 4@4½c, for farmers' grades.

COTTON.—The quotations, according to the American classification, are as follows:

	Uplands.	New Orleans and Gulf.	Texas.
Ordinary	6 9-16	6¾	6¾

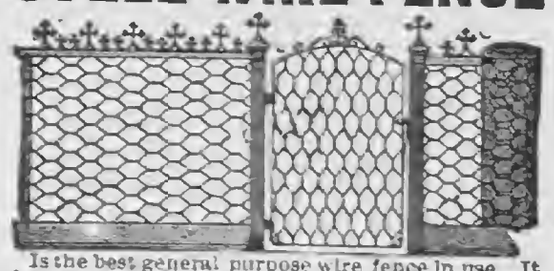
SEDGWICK STEEL WIRE FENCE


Is the best general purpose wire fence in use. It is a **strong net-work without barbs.** Don't injure stock. It will turn dogs, pigs, sheep and poultry, as well as horses and cattle. The best fence for Farms, Gardens, Stock Ranges and Railroads. Very neat, pretty styles for Lawns, Parks, School-lots and Cemeteries. Covered with rust-proof paint, or made of galvanized wire, as preferred. It will last a life-time. It is **better than boards or barbed wire** in every respect. The **Sedgwick Gates** made of wrought-iron pipe and steel wire, defy all competition in lightness, neatness, strength and durability. We make the best, cheapest and easiest working **all-iron automatic or self-opening gate,** and the **neatest cheap iron fences now made.** The **best Wire Stretchers, Cutting Pliers and Post Augers.** For prices and particulars ask Hardware Dealers, or address, mentioning paper,

THE BEST MILL ON EARTH. Made by THE FOOS M'F'G. CO., SPRINGFIELD, O.

AN EXTRAORDINARY OFFER TO AGENTS.

We want live, Energetic and Capable Agents in every county in the United States and Canada, to sell a patented article of great merit, *on its merits.* An article having a large sale paying over 100 per cent. profit, having no competion, and on which the agent is protected in the exclusive sale by a deed given for each and every county he may secure from us. With all these advantages to our agents, and the fact that it is an article that can be sold to every house owner, it might not be necessary to make an "*Extraordinary Offer*" to secure good agents at once, but we have concluded to make it to show, not only our confidence in the merits of our invention, but its salability by any agent that will handle it with energy. Our agents now at work are making from $150 to $300 a month clear, and this fact makes it safe for us to make our offer to all who are out of employment. Any agent that will give our business a 30 days' trial, and fail to clear at least $40 in this time, *above all expenses*, can return all goods unsold to us, and we will refund the money paid for them. Any agent or General Agent who would like ten or more counties, and work them through sub agents for 9 days, and fail to clear at least $750 *above all expenses*, can return all unsold and get their money back. No other employer of agents ever dared to make such offers, nor would we if we did not know that we have agents now making more than double the amounts we guaranteed, and that by two sales a day would give a profit of over $125 a month, and that one of our agents took 21 orders in one day. Our large descriptive circulars explain our offer fully, and these we wish to send to everyone out of employment who will send us 3 one cent stamps for postage Send at once and secure the agency in time for the boom, and go to work on terms named in our extraordinary offer. We would like to have the address of all the agents, sewing machine solicitors and carpenters in the country and ask any reader of this paper who reads this offer, to send us at once the name and address of all such they know. Address at once

RENNER MANUFACTURING CO.,
216 Smithfield St., Pittsburgh, Pa.

For the Young.

THE CRIPPLED CALF.

THE Jersey calf was crippled; far behind
The herd she limped as to and from the field,
They passed, at morning through the dewy grass
At night o'er-burdened with their fragrant yield.
She limped along and tried to hold her place
Though thin and poor, and often in disdain,
The lordly Hereford turned her great white face,
And ridiculed the crippled Jersey's pain.

The Short-horn and the Devon laughed in scorn
To see the cripple hobble far behind,
They only sought to strike her as she passed,
They might have used her tenderly and kind.
"Aha!" they sneered "you 'famous butter cow',
You can't pay wages with that limping walk,
You are not worth your salt, we reckon now,
Its beef and weight and muscle make the talk."

But one old scrub, the butt of all the herd,
A poor old battered cow that knew no style,
Nor pedigree nor polish left the herd
And walked beside the Jersey all the while,
And day by day the patient creature walked
Beside the calf, and cheered her on her way,
She cared not how the petted "pure bloods" talked
She knew she was not half so smart as they.

And when at night within the dry warm sheds
They pushed the cripple from their bed so warm,
The old scrub bowed her meek and patient head
And stood between the cripple and the storm.
And so until the little Jersey died
The selfish cows looked for themselves alone
And still the good old scrub bore out her part
And did her work without complaint or moan.

But one dark night a fearful storm arose
The sheds were tossed like playthings on the air.
And wildly beat the storm upon the cows
That huddled wild and unprotected there.
Then bitterly the petted "pure bloods" moaned;
They knew not how to stand the cold and rain,
Their selfish life had sheltered them from harm,
They felt with double power the touch of pain.

But turned against the blast, the good old scrub,
Cared nothing for the storm, her thankless life
Had made her stronger than she ever knew,
She stood unharmed through storm and cold and strife.
Strength only comes from sorrow; he who turns
Aside to ease the burden of a friend
Will feel his load grow lighter; we shall need
The strength thus gained before we see the end.

WE have been having a taste of the drought which the Cousins have been reporting. It didn't last long enough to cause any serious damage, but it gave us a good idea of what dry weather might be. I don't think I ever lived in a country yet where the weather was just exactly what I wanted it to be. I do not propose to hunt for such a country for I am convinced it would take so long to find it that all my friends would die before it was found, so that I would have to live there alone. The best way is to make the best of what we have, and be just as contented as possible.

We think our cat is pretty smart. She had five kittens a short time ago and three of them disappeared. I think the old cat had an idea the others would go in the same way. She hid them at any rate, and we could not find them for awhile. At last we found them up in a tree. Some 15 feet above the ground there is a hollow limb and in this safe place Mrs. Molly had placed her children. How do you suppose she got them up there? She must have held them in her mouth and climbed up the trunk of the tree with them. That must have been hard work, but a cat will do almost anything to save her kittens.

An ant can carry off a piece of food several times as large as itself. If an elephant's muscles could be as strong in proportion, he could move a good-sized piece of the world. Suppose a man could have muscles as much stronger than those of an ant as they are larger, suppose his eyes were as much sharper than those of a bee as they are larger, that he had the speed of a deer, the hearing of a rat, the courage of a lion and the patience of an ant. He would be a wonderful creature, wouldn't he? He wouldn't be any happier, that I can see, however. He would be so different from other people that he would have no friends or associates. He would kill everything he touched; he would see and hear too many things. On the whole I think such wonderful qualities would make a very poor gift if they could be given away. That health, strength and property are best which we make ourselves. When we see people who are stronger, better and smarter than we are, we must not envy them. The point is to see *why* they are smarter or better than we are, and go to work to see if we cannot find out their secret.

Japan is a queer country about many things, but there are some customs that might well be introduced here. The people are very fond of birds, and are glad to have the little creatures about them. When the birds come to build their nests, the Japanese place boxes and baskets, with good nests in them, about their houses, so that the birds will come into the family. If a bird builds a nest in an exposed situation, a cover is placed over it, and great pains taken to care for the young birds. There are many people in this country who might well follow the example of the Japanese in this matter.

Picking up potatoes is about the hardest work on the farm to my mind. It is work that comes in very handy for the farm-boy. He is sure to be put at it. There will be plenty of chances for him during this month. It is back-aching work. I have done lots of it. I never saw a man or boy who liked to do it, but it has to be done by somebody, and it is better to do it without grumbling.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

The only pupil who carried more books than dinner was a thin, delicate little girl, who came timidly in and stood on the outside of the company about the stove. As soon as she appeared the freckled-faced girl, who had given me the apple, left the stove and danced before the newcomer. Not satisfied with dancing, she made up a series of horrible faces, by placing her thumbs in her mouth and her little fingers at the corners of her eyes, and pulling the face into a sadly-mixed expression.

"Teacher says I can have your seat! Teacher says I can have your seat. Iv'e got it too. You've got ter set way back yunder. Ain't I glad! Ain't I glad!"

All through this speech she continued her dancing. She took one hand away from her face to point at the object of her remarks, who received this intelligence with evident sorrow. Her eyes filled with tears, and her lip quivered, as she slowly walked to the uninviting seat at the rear of the room. The scholars all laughed at her, and several shouted, "Cry-baby," as she passed them. One boy reached out his hand to pull her hair as she went by him, but, catching my eye, he let his arm fall.

Just as she reached her seat a loud shouting on the outside attracted the attention of the scholars. They ran to the window, and, at the sight of two young men standing in the road, rushed out in a body to hold some sort of consultation by the broken gate. I watched them for a time. There seemed to be some exciting discussion going on, and by the way they glanced and pointed at the school-house, I judged that I came in for my full share in the talk.

While they were thus engaged, I walked down the aisle to speak to the little girl who had lost her seat. She was just drying her eyes, and her lip was still quivering.

"You musn't feel badly about the seat, it's first come, first served, you know," I said, thinking some consolation was needed.

"But Miss Benson told Manma that I could have it if I could go the whole term without being tardy. I don't care about myself, but Mamma is sick and she will feel dreadfully about it." Her mouth began to quiver again and her eyes were filled.

"Was Miss Benson the last teacher?"

"Yes, and she told Mamma over and over again that I could have that seat."

Perhaps I should have used more policy in the matter, but the little girl's grief touched me. She was different from the others, and the other girl had acted a lie too.

"Take your books and put them in the other seat"—I said at once.

"But what will Mollie Brawn say?"

"Brawn?" That was the name of the district bully. If it was his sister, the change would mean trouble at once, but I was determined to make it.

"I will talk to Mollie. Put her books in this desk, and take yours over there."

The change was made as I directed, and the little girl sat in her new seat as happy as she had before been miserable.

At nine o'clock I rang the bell at the school-house door. The scholars reluctantly gave up their conference at the gate and came slowly toward the house. The two young men walked down the road. After a few steps they turned and shook their fists in the direction of the school-house. I was not entirely surprised when one of the little boys volunteered this information:

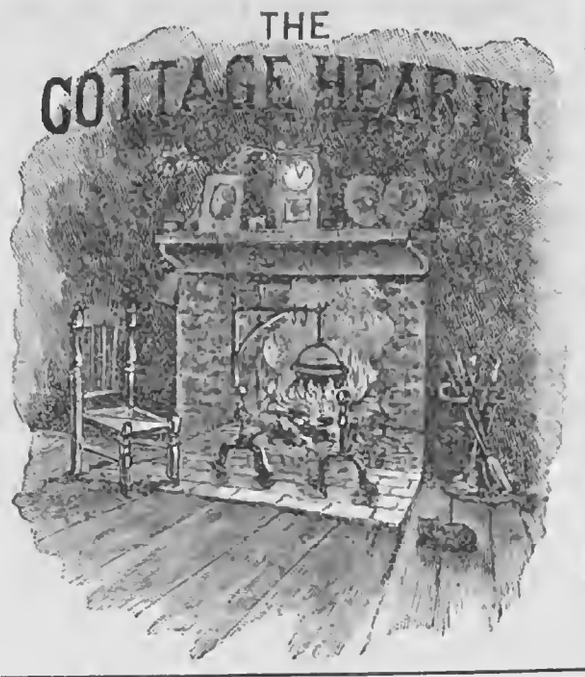
"Yunder's Jack Brawn. He's a whale now, you bet. He says he'll bet his boots he can whip you with one hand."

Several of the larger boys here tried to push this informer out of the way. In fact, he himself seemed to regret his indiscretion in detailing the plans of the enemy.

The boys all stopped at the door to see how I would take this bit of information. I knew that it was necessary for me to say something. Experience had taught me that such people as Bear Creek seemed to possess in quantity always accept silence as an evidence of cowardice. In fact, two-thirds of the fighting is always done with the tongue. So I preserved a solemn countenance and merely remarked:

"Well, boys, I don't know what Jack Brawn wants to do; but I always fight to kill. You never can find two of us alive after I fight."

This piece of bravado had a most decided effect. The boys grew respectful at once. I knew every word of the speech would be reported to the bully—in fact, I proposed to fight him over the heads of the others if I could do it.



THE COTTAGE HEARTH is the best Magazine for its price that we know of. It is filled with pure, wholesome literature. It is a large, 32-page magazine, beautifully illustrated and elegantly printed. The best writers in the world are among its contributors. We can assure our readers that they will be pleased with the Cottage Hearth. Those who secured it last year are enthusiastic in its praise. We have made special arrangements whereby we are enabled to offer both papers (regular price $3.50) for $2.25. This is a remarkable combination.

Send to COTTAGE HEARTH CO., BOSTON, MASS., for a free sample copy.

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]

Is the only Practical Preventive of the so-called Swine Plague.

If used in proper quantities, it will

1. *Prevent Disease;*
2. *Arrest Disease;*
3. *Pay for itself with the increased pork it will put upon the hogs.*

AS AN EVIDENCE OF FAITH

In my Remedy, I make the following offer:

I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my Remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and neither inbred, close-bred, or the progeny of such.

WHAT IS SAID OF THE REMEDY.

"It has stopped the hogs dying and improved their appetite."—F. C. GOLDSBOROUGH, Easton, Md.

"Have used the remedy with success."—D. G. BARBER, Easton, Md.

"This medicine has been thoroughly tested and its merits established on the eastern shore."—Record and Gazette, Pocomoke, Md.

"I will not be without Haas's Hog Remedy if it costs three times the present price."—JOHN CASTIN, Grant City, Mo.

"We would not risk feeding a pen of hogs without the remedy."—WAITE & CO., Gibsonton, Pa.

"I would not think of raising hogs without it."—J. M. ELLSWORTH, Marthasville, Wis.

"It gives satisfaction every time."—J. G. BARTLETT & SON, Suncook, N. H.

"It has never failed to arrest the disease yet."—JONES & MUSSELMAN, St Paris, O.

"I have sold over $2,000 worth, and am pleased to say that it has given good satisfaction."—MELLE WILLIAMS, Druggist, Taylorville, Ill.

The Remedy can be procured of all druggists, or from my Laboratory, upon receipt of price.

Prices, **$2.50, $1.25,** and **50 cents** per package. 25 pound cans, **$12.50.**

JOS. HAAS, V.S.,
Member of Indiana State Veterinary Med. Association,
INDIANAPOLIS, INDIANA.

Agents will be supplied with canvassing outfit on application.

Entered at the Post office at New York City, N. Y. as second-class mail matter.

PERSONALS.

BRET HARTE is now described as a handsome white-haired man, with a red English complexion.

LIEUTENANT GREELY is now in better health than at any other time since his return from Lady Franklin Bay.

THEY are discussing President Grévy's state of health again in France. He suffers from no especial malady, but is steadily growing weaker. He is now 84, and suffers perhaps just a trifle from old age.

MR. ARTHUR BALFOUR, the new Secretary for Scotland, owns and has rented for $13,500 for the season, the great Strathconon deer-forest of 60,000 acres.

MR. J. W. CLAYTON, a well-known business man of Atlanta, Ga., estimates that at least 10,000 people have emigrated from that city in consequence of inability to procure employment since the Prohibition fever struck the town.

JAMES GATNER, an English railway porter, whose wages were but 19 shillings per week, has just died, leaving $20,000 as the result of accumulated tips from passengers. Tipping is the biggest nuisance in the United Kingdom.

A. K. CUTTING, the creature who made the trouble on the Mexican border, deserted his family several years ago, and his wife is now supporting herself and half a dozen children in Kansas City. He has always been in trouble with neighbors and employés.

JOHN G. SAXE, the poet, is slowly dying at Albany, N. Y. His nervous system has never recovered from the shock received in a Western railroad disaster in 1875, when he was rescued from a wrecked sleeper just in time to escape being burned to death.

THE father of Thomas A. Edison, the electrician and inventor, is living at Hessonia Beach, Mich., at the age of eighty-two years. He has six children—three by his first wife and three by his present one. The inventor's youngest brother is only four years old.

THE Autocrat of the Breakfast Table returned from England Monday, on the seventy-seventh anniversary of his birth. However cordial the reception accorded to Dr. Holmes abroad may have been, it cannot exceed the love and esteem in which he is held by his countrymen who now welcome him upon his safe return home.

SENATOR MAHONE, playing billiards the other evening before a number of his admirers, tried a difficult shot, and just missed making it. He looked disgusted. "That was magnificent, even if it didn't count, General," said a friend. "No, sir," said the little man, sagely, "nothing is magnificent that misses."

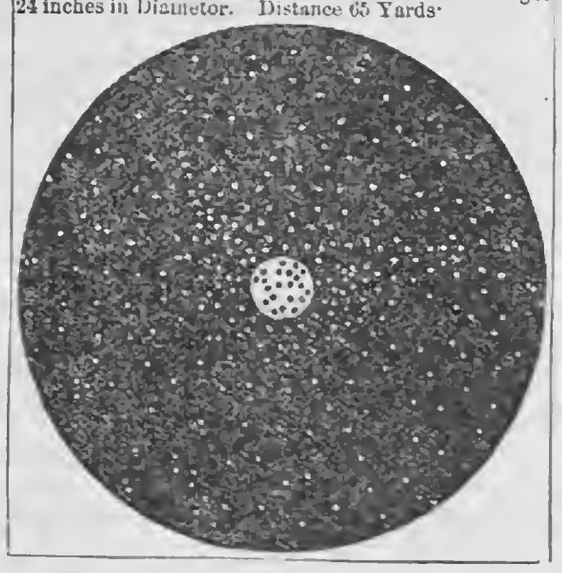
The "WOOLWICH"
METAL, PERFECT
Double Barrel Breech
LOADING SHOT GUN
$12.50

Greatest Bargain Ever Offered
$12.50 FOR A $30 SHOT GUN.
Every Part Hand made and warranted
Lightest, most reliable shot gun ever made
NOW OR NEVER IS YOUR CHANCE!
to get the best handmade, reliable shooting gun ever manufactured.
In the great gun factories of the world continual experiments are made to obtain the greatest strength with other needed qualities in gun metal. After innumerable trials they at length hit upon the kind of metal used in this gun, hence it is named the "WOOLWICH," in honor of the Woolwich Infant, the most powerful Rifled cannon in existance. But not only is the metal the best in the world, but it is made by the most skilful artizans to be found in any gunsmith's shops anywhere. It is
The Grandest Triumph of Intelligence and Practice.
It is made for service, not show, although very handsome. No other breech-loader begins to have anything like the same powerful action. It is a centre fire, 10 or 12 bore, Steel Barrels finely bored. Has very easy working Steel Lock, blued; an automatic shell ejector suits either paper or brass shells handsome case hardened mountings. Barrels 28, 30 and 32 inches.
It Shoots Perfectly at 80 Yards and Will Kill at 150 Yards.



This Illustrates a Target with both Barrels. Target 24 inches in Diameter. Distance 65 Yards.

It is one of the strongest arms ever made weighs from 7½ to 9½ pounds. It has all the best qualities found in a $50 Shot Gun. The instant your eye spots this gun you will admire it and the first trial will convince you that you never took sight over a better or truer piece. We intend to be permanently engaged in the sale of the WOOLWICH Gun and for this reason we put it, for the present, at so low a figure, as we are satisfied that every Hunter and Sportsman will concede it to be the best shooting gun furnished at any price. So satisfied are we of the great merits of this gun that we will send C. O. D. on receipt of $3.00, subject to examination. Balance of bill to be paid at express office. As soon as enough of these guns are sold at $12.50 to make them well known to the shooting classes we shall put the price up to $25.00 knowing they will readily sell at that wherever known. Now is the time to be sure of getting this excellent Gun at $12.50. A good gun like a good watch is always valuable and will often sell for more than twice its cost. To any one sending $12.50 at once, full amount of cash with order
WE WILL GIVE FREE A SPORTSMAN'S BELT of fine water-proof canvas and 25 Shells extra.
Our patented solid brass shells, which prevent charges and wads from falling out, furnished at 60 cents a Dozen, $4 a Hundred. Paper Shells 75 cents per Hundred. $2.00 will buy full set reloading tools,
IF YOU WANT A GOOD SHOT GUN AT A MODERATE PRICE BUY THIS.
Send money by Post Office Order or registered letter.

THE DANIELS PLOW SULKY

Is unlike any other sulky in the world, and owing to its peculiar construction it will work equally as well on rough, stony land as on the Western prairie. We want every one of our readers to write to E. Daniels & Co., Havana, N. Y. for circulars and prices. They say it is the cheapest, simplest, and most durable sulky in the market. It can be attached to any common walking plow in five minutes' time, and is warranted to do better work with less draft than any plow made, either walking or riding. They want a good live man to act as agent in every town in the U. S.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1912. NEW YORK. SEPTEMBER 18, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

Horticultural.

THE CARMAN RASPBERRY.

IN April of last year, G. H. & J. H. Hale, of South Glastonbury, Conn., sent us four plants of a new blackcap raspberry, two of which were large plants with ample roots, that bore an abundance of fruit in late June and early July. Our illustration (Fig. 361, p. 629) is an accurate portrait drawn from a branch at that time. The berries were somewhat smaller than those borne this year, an average cluster of which is shown at Fig. 360. Had we desired to show the fruit at its best, it would have been easy to have selected larger berries.

The berries began to ripen June 29. They are jet black (without bloom), with small drupes, and as good in quality as any cap berry we know. The two larger bushes bore as many berries as any variety ever tested at the Rural Grounds. They grow, however, in a part of the garden where all raspberries do well, and the season was in every way most favorable to an abundant fruitage. The canes are stout, and have grown to the hight of six feet. They were not in the least injured by the past Winter. Earliness, productiveness, hardiness, quality and firmness might be claimed for this variety if judged by a single year's test, which is a very hazardous thing to do.

ITS HISTORY, ETC.

ED. RURAL NEW-YORKER: Your card requesting the history of the Carman is at hand. Possibly I can do no better than to send a copy of what Mr. Sherwood wrote to State Secretary Gold two years ago. The following Spring the entire control of the stock of plants was given to our firm, and we named the new seedling Carman, in honor of the Editor of the RURAL NEW-YORKER. It has fruited here this season side by side with all the leading black-caps, and I find it as early as the earliest: jet black, as large as the Gregg, and the best in quality of them all. Indeed it is by all odds the best black-cap I have ever seen. J. H. HALE.

So. Glastonburg, Conn.

MR. T. S. GOLD, Secretary of the Connecticut State Board of Agriculture:

In reply to your question, "Are there any new choice fruits in this locality not generally known?" I will state that I have a new blackcap raspberry which, some 10 years ago, came up by a stone fence in a corner of a meadow, in a bunch of elders, and for two or three years I noticed it was double the size of others, so I found three roots and set them in the garden in vacancies among old plants. These were neglected for other outside work—onions, etc. Then I pulled up all and set out a new spot on the opposite side of the garden—a row of reds and a row of black-caps, with sweet corn between, 12 plants of each kind. When two years old, I picked 40 quarts from 11 plants, which had also been neglected, not having been tied up or manured. They did so well that in the Fall I threw a little dirt on some of the shoots, and in the Spring of 1881 they had rooted at tips and joints. I set out a quarter of an acre with them, using anything that had a root, the smallest portion being tips; but the joints did not make good plants, so I have increased until this year (1884) from an acre (and two-thirds of those one-year-old plants) I have picked 2,851 quarts, and sold 2,798 quarts at wholesale (mostly to one man) or $316.75. I shall have 1½ acre in bearing next season. The plants are stocky growers, with large clusters of fruit and some along the stalk. Berries large—about two inches in circumference, a great many 2½ inches, and some three inches. They are not so flat as Souhegan or Gregg, a shiny black, free from bloom. The vines continue long in fruitage. I picked berries for market last year from July the 4th until the 25th, and this year from July 7th until the 28th, and longer for the table. It is, therefore, a good family berry, and being several days earlier than Souhegan, and so firm, with a good flavor, it is a good market berry. I should have had 3,000 quarts but for heavy showers which beat the berries in the dirt, as most of them were on young plants; so I lost some, and many being dirty sold for less. ARTHUR H. SHERWOOD.

Southport, Conn.

FROM MARSHALL P. WILDER:

In regard to raspberries, the Carman is the earliest cap variety I possess. It is sweet and *very* good, a valuable acquisition.

Dorchester, Mass.

FROM PROF. S. M. TRACY:

The two plants of Carman Raspberry received from Hale Brothers a year ago, made a fine growth during the Summer, but one of them was nearly killed during the Winter. The remaining plant fruited well this season. Berries not quite so large as the Gregg, but more abundant—very firm and of the best flavor. From the little I have seen my impressions are very favorable.

State University, Columbia, Mo.

FROM A. W. CHEEVER:

I saved two plants of the Carman, one of which has failed to thrive this year. The other bore a good crop for the size of the bush, and the berries were the largest and richest black-caps I have ever tested. The Mammoth Cluster is nowhere beside it with me for productiveness or quality. My bush is small and did not bear a quart all told, and consequently we had but very few "meals" from it; but enough to be able to say it pleases us better than any variety of the cap raspberry (white or black) that we have ever tested.

Ag. Editor N. E. Farmer, Dedham, Mass.

From J. B. ROGERS:

In the Spring of 1885, Messrs G. H. & J. H. Hale, of Connecticut, sent me for trial plants of the Carman black-cap. My soil does not seem congenial to the growth of this variety of black-cap. I cannot get any growth to speak of, and hence can say nothing as to its merits.

Milburne, N. J.

FROM THE N. E. FARMER OF AUG. 7:

A new black-cap, the "Carman," not yet sent out except for trial, was received a year ago from the Hale Brothers, South Glastonbury, Connecticut. A single bush fruited this year, bearing heavily for one of its age and size. We had rather lost affection for black-caps since becoming acquainted with the better red raspberries, but the Carman is large, even in shape, very handsome and more palatable than any black-cap we have before tested. We can see no reason why it should not become one of the standard popular small fruits. The black-caps are usually hardier than the reds, and the fruit, being firmer, bears transportation better. The great fault has been, they bear carriage too well, but the Carman has comparatively soft pulp with less prominent seeds.

THE CARMAN BLACKCAP RASPBERRY. From Nature. Fig. 360.

THE MINNEWASKA BLACKBERRY.

THE originators of the above blackberry request us to publish the following letter to them. The R. N.-Y. has expressed itself rather freely perhaps respecting the Minnewaska, and we are glad to present any evidence on the other side:

A. J. CAYWOOD & SON,
Marlboro, N. Y.

DEAR SIRS: "My experience with the Minnewaska for one year has been very satisfactory. From its start in the Spring to this time (August 19) it has shown wonderful vigor. It fruited heavily, and the berries were of the largest type and uniform, every one being perfect in form. I find it earlier than I supposed, as it commenced ripening some three days earlier than the Early Wilson, or Wilson Jr., and finished its crop some 10 days earlier than either, making it decidedly an early variety, and some of our best fruit growers who have watched it carefully think it will supersede both these varieties, as they are both affected with the double-blossom nuisance. I tested the shipping quality, of the Minnewaska by handling a few quite roughly and laying them away and in six days some of them began to decay, but held their black color without any change to red to the last. On the whole, they have succeeded beyond my expectations as one-year-olds, and if they hold their good qualities with age they are certainly a great acquisition. Mr. W. A. Brown, the Inspector of the Mich. Fruit Exchange, and one of the best authorities in the State, has watched this variety carefully and says he believes it to be the coming blackberry.

Benton Harbor, Mich. R. MORRILL.

INTRODUCTION AND IMPROVEMENT OF NEW VARIETIES OF STRAWBERRIES.

I PROPOSE to make a new departure in the

introduction and dissemination of [new varieties of strawberries, with a view of preserving all the best qualities of the fruit and plants by making what may be called pedigree plants by selecting the best when they are in fruit. I believe that many new varieties have been ruined and have fallen into disfavor and consequently been discarded by a promiscuous introduction of runners, without knowing the size and quality of fruit any particular runner will bear. We can determine whether a particular runner is a strong, healthy grower; but we can not tell what kind of fruit it will bear. Probably some of the characteristics of the original will remain; but not all the best ones. My investigations and experience have taught me that there is as great a variation in different runners of the same plant as there can possibly be in the progeny of the same parents of fowls or other animals, which all experienced breeders know is not a little. In some of the runners there is a decided improvement, and these are the ones we want to "breed" from; but as a general thing, there is a tendency to degeneration, as many of the fine fruits and vegetables which have gone out of cultivation afford clear and striking evidence. I have noticed that plants which have degenerated in quality of fruit are prone to propagate themselves faster and stronger than those which maintain their higher qualities, and consequently one can see how it is that a new variety may be ruined by sending out the runners promiscuously without knowing what quality of fruit they will bear. The first consideration in the introduction of a new variety, should be strength of plant; second, productiveness; third, quality, size and color of fruit.

For the last four years, in the new variety (the "Banquet") which I am propagating, I have been selecting, marking and throwing out all plants which did not come up to the standard of the original in quality of fruit. In the introduction of this new variety I purpose sending out only one plant to each propagator and that plant will be in fruit at the time it is sent out, and have a pedigree number. One advantage of this plan (and a very great one) is that it will enable the receiver to observe and determine the principal characteristics of the new variety he is about to propagate, and all his stock will be grown from a plant combining the highest characteristics of the new variety and the propagator who makes the closest investigations and selections will have the best pedigree plants.

This will require a good deal of care and labor, and consequently carry single plants up to a high price, owing to the necessity of selecting the strongest runners and transplanting them and growing them another year, and selecting those which have maintained or improved upon the best characteristics of the original plant. Now the variety which propagates itself the most uniformly as to its original characteristics, and which improves in its better qualities will, by these selections, become the most valuable. I would request consideration, investigation and comments upon these views by those who feel interested.

Orange Co., N. Y. J. R. HAWKINS.

KIND OF NEW FRUITS WANTED.

THE multiplication of new fruits is so fast that great caution or a deep purse is needed to keep up with them, and the work of the RURAL is a good one in giving reports of tests on its trial grounds; still it can only speak of the conduct of the plants on its own grounds, and we must all judge of each case for ourselves. In the case of the Marlboro Raspberry the results of the tests by the RURAL do not hold good in my soil (a light sandy loam), in which it is a rampant grower and free bearer; but the quality of the fruit is not up to my standard, though where it originated the quality is good.

We need no more kinds except those that are an improvement in some direction on the old. A raspberry that is early, hardy, and solid for market is the only kind that should be welcomed. A blackberry to be of use should be hardy, early, of good flavor and size as well as prolific—hard things to get all in one plant, 'tis true, yet I believe it can be done. A new strawberry should be of good size and flavor and of an attractive color and ripen uniformly. It should be a good bearer and capable of resisting the rust by the vigor of its foliage.

The Sharpless is an example of a large, vigorous berry whose merit to me is lost owing to its uneven ripening, particularly in the early part of its ripening season. One end is then ripe while the other is green, and the first is rotten when the other is ripe. The Bidwell is somewhat of the same kind; so are several others. All new candidates for favor should be free from these defects. A berry that will yield 20,000 quarts to the acre ought to be of value; but to me it would be interesting to learn precisely the treatment given to produce such results, for at 25 cents per quart, the income would be $5,000 per acre.

Creedmoor, N. Y. H.

The Vineyard.

GRAPES IN 1886.

GEO. W. CAMPBELL.

NEARLY all grapes have done better this year, and ripened earlier than usual in this region, and I find this to be generally true in all sections throughout the State, and the grape crop will probably be, both in quality and quantity, above the average. There seems to be less difference also in the time of ripening between the varieties than usual, the earlier and later varieties coming to maturity nearer together, and all from one to two weeks in advance of their usual period. I will remark upon them about as they ripen in succession.

JANESVILLE was the first to color, beginning the latter part of July, and being quite black by August 5. The vine is very hardy, and generally healthy; moderately productive of rather small clusters, and medium-sized berries; pulp hard, with little reddish juice next the skin; quality and flavor poor; more sprightly, but hardly better than Talman; cannot be recommended except for extreme northern locations, where very early ripening is indispensable.

MOORE'S EARLY.—Vine very healthy and vigorous; fruit began to color about August 10 and was quite mature August 20. Berries larger than Concord; bunches smaller. Skin tender and easily broken, like Concord, which it closely resembles in quality and flavor. With me, it has not been as vigorous in growth or as productive as Concord, but it is valuable for early ripening, especially in northern latitudes.

LADY ripened this year only three or four days later than Moore's Early and still continues to be the best white grape of its season. The vine has the health and hardiness of the Concord; but is less vigorous in growth. In quality, better than usual this season, and fully matured August 25th. Some clusters were eatable on the 15th. Its greatest fault is a very thin skin, easily broken, and which sometimes cracks in rainy weather about the time of ripening. It is thought much better flavored than the Concord by most people.

GOLDEN GEM.—A small, white grape of excellent flavor, but too slender in growth, and too small to be profitable or popular except for amateurs. The vine seems reasonably healthy and hardy, but weak and slender. Claimed to be a cross between Iona and Delaware. Ripens very early—about Aug. 25, this year.

EARLY VICTOR has fully sustained its character as a hardy, healthy and prolific variety. The clusters are sometimes too compact and crowded upon the stems. The foliage has been perfectly healthy and the fruit entirely exempt from rot. It is a few days later than Moore's Early; clusters nearly as large; berries much smaller, but of better flavor. Very promising for a profitable early market grape.

FRANCIS B. HAYES has rather too much name, which will probably be cut down to Hayes, which will be better. I have fruit this year for the first time, on a young vine—some six or eight clusters—and am agreeably disappointed in finding it much better than I expected, as well as earlier. It has become so common to represent all new grapes as "earlier than Hartford," that I always receive the statements with many grains of allowance as to earliness. Judging from the performance of the Hayes this season, I should say Mr. Moore has not overrated or over-praised it. It is now (Aug. 28), well ripened, and is to my taste the best and purest flavored of all the Concord seedlings, black or white, that I have grown or tested. In growth, the vine is much like the Martha, and I should judge would be of about equal productiveness; but about ten days earlier in ripening, and of far better quality, having scarcely a suspicion of foxiness. The skin, though thin, is more tenacious than that of Concord, and it will probably both keep and carry well. Its color—a light yellowish green thinly covered with white bloom—makes it attractive in appearance, and though bunch and berry are not above medium in size, it has the promise of being a first-class variety for general culture.

EMPIRE STATE is making a strong, healthy growth, and all vines large enough are bearing well. Clusters, long and handsome; berries of medium size, very light green, but so covered with a thick white bloom it is nearer to a really white grape than any other variety I have grown. Some clusters are very nearly mature and quite eatable; but it will be from September 5 to 10 before they are perfectly ripe. It is a very fine-flavored grape, with a distinct Muscat flavor, suggestive of the finer foreign varieties. Although claimed to be a cross between Hartford and Clinton, I believe there is a dash of the foreign element in its character, though only developed in the fine quality of its fruit. So far, however, the vine seems both hardier and healthier than many fine natives, and the fruit has shown no disposition to rot. Unless some difficulty not yet apparent should arise hereafter, the Empire State will have a brilliant and successful future, as a hardy, healthy and productive grape of best quality.

EL DORADO is a strong-growing vine, with large and generally healthy foliage; but has never been very satisfactory, as its blossoms are imperfect and it often fails to set its fruit well. The clusters are generally small and straggling, and sometimes rot pretty badly. Can hardly be recommended except for amateur culture, though its quality is fine and it ripens early.

BRIGHTON has steadily grown in favor, and seems to improve as the vines get older, bearing larger and finer clusters, and more of them. Though not quite hardy without winter protection when the temperature is much below zero, it is a strong-grower and the grape is of fine quality, agreeable apparently to all tastes, being pleasant and sprightly, sufficiently sweet and without foxiness. The blossoms are apparently not quite perfect, having reflexed stamens, but it appears to fertilize well, and form handsome, not too compact clusters.

FAITH is one of Rommel's Missouri seedlings of the Riparia class, probably from the Elvira. An enormous, strong-growing, long-jointed vine, with large foliage. It is moderately productive, bearing long, slender clusters of rather small white or light-green berries, ripening quite early, of fairly good, but not remarkable quality.

NIAGARA is fruiting with me for the first time this season. The vine has made a good growth, the foliage is unusually healthy, and the berries and clusters are both good, for the size and age of the vine. Not yet ripe enough to judge of its quality fairly, but it has a good deal of the foxy odor already. Will apparently be fully ripe about Sept. 10, to 15th. Quite satisfactory this season as to growth and bearing. Vines show very little mildew, and no rot.

POCKLINGTON.—Judging from the past two years' experience, I think this grape has been under-estimated, and I venture to predict that as a popular and profitable market grape, except in a few Northern localities, it will grow in favor, as it becomes better known. Though often rather slow of growth while young, the vines are hardy and healthy, and the bunches and berries increase in size with the age of the vine, and it becomes one of the most productive, and the clusters the largest and handsomest of its class. No vines of any variety are bearing more handsomely this year, than the Pocklington. A very important matter is, that the skin of the Pocklington is more tenacious than that of Concord, Lady, Worden, or any other of the Concord seedlings, thus enabling it to be handled and shipped without injury, and also to be kept without injury for a long time after gathering. When fully ripe, it is of a delicate yellow color, and though it has a considerably foxy odor, it is rich and pleasant-flavored, and to most tastes a very acceptable grape. To my taste it is certainly better than Concord. It is nearly ripe, some clusters being now eatable. Will apparently be fully matured by Sept. 10 to 15.

VERGENNES is also doing well, and bearing heavily this season, berries and clusters improving each year. Now nearly colored, though the vine is really over-bearing. Foliage healthy no rot. A promising variety.

JEFFERSON. But little later than Vergennes. A good grower with large and healthy foliage. Bearing well; clusters large and very handsome. One of the best of all the red grapes; only requires fall pruning and laying down, with slight winter protections to succeed in all reasonably good grape-growing localities. It is a variety well worth a little extra trouble, as its only fault here is want of hardiness in very severe Winters. It endured, last Winter, 13° below zero, uninjured, growing near a stone wall with an eastern exposure. It ripens here about one week to 10 days later than the Concord.

LADY WASHINGTON has proven rather variable. In favorable seasons, like the present, it bears well, and when ripe is both handsome and good, though not high-flavored. It is a very strong grower: bears large clusters of light, pink-colored berries. Has shown some rot early this season; but is bearing fairly well. Will not be ripe apparently until the middle to last of September.

DUCHESS has made a good growth and set an abundance of fruit. The foliage has shown some mildew, and a good many clusters rotted pretty badly early in the season. A portion which escaped are promising to ripen well. A pure flavored and fine grape, worthy of a place where it can be grown.

Delaware, Ohio.

Farm Topics.

CORRESPONDENTS' VIEWS.

I HAVE made a trip through the East, and it paid me well to look over the style of farming they have there. It is a good thing for men to stir away from home now and then and see what other folks have to do in order to make a living. The Eastern farmers can teach us a good many things, but we can show them a thing or two also. They say they make their money by taking care of all the little things. It looks to me as though they are inclined to put too much time into these little things. A little more attention to what they call big things would help many of them. I found lots of men within thirty miles of New York making good livings on little farms of twenty acres. They buy manure by the carload and chemical fertilizers by the ton, and scratch up every inch of soil they have. It beats everything what crops of vegetables and fruits they can get. There seems to be a good market for every potato they can raise. I don't see what they get to do in the Winter. Most of them seem to keep a cow or two, but not enough for a dairy. The soil needs manure badly. I can't get over the idea that so much chemical fertilizer used year after year will ruin the soil. They need more substance; they can get that in barnyard manure. It strikes me that if I were in that business I would feed cattle through the Winter. I could get good steers at the market nearby. I could make it pay to ship baled hay from the West by the carload and feed it out with grain and oil-meal. I believe I could put flesh enough on the steers to pay for the feed, and have all the manure to pay for my labor. Some of them seem to do this on a small scale, but I think it would pay to work it heavily. Then, in hogs and spring lambs there is a good chance to get pay for the Winter's work and keep the farms up. It takes lots of room to pasture cattle, but a good many of them can be fed on a small farm.

Lenawee Co., Mich. A. C.

"H. B. G.," page 559, thinks few real farmers are making money. He must live in a poor country, or among a poor class of farmers—the two are closely allied. If there is any money to be made in any branch of work it surely ought to be made in farming, for upon that all other industries depend. The farmer is a general consumer as well as producer, and when he fails to produce his regular crops, all other business must stagnate. Friend G. is mistaken in saying that most moneyed farmers got a start in some other line of work. True, some men made a start off the farm, but do such men really make money from the farm? I doubt it. Most of them do not. They generally know nothing about farming, and after a few years' trial they are glad to go back to their former occupations. Some moneyed men take a farm more for the pleasure it gives them than for any money-making object. In my opinion the farmer who makes money, or has made it, is the one who commenced as a farmer, who has stuck to the farm through thick and thin, and through high prices and low prices has made it a business, and conducted it on business principles, who has given attention to details, has kept out of debt, paid cash for what he has bought, and taken and read a paper like the RURAL. C. L. N.

Tullahoma, Tenn.

I LIKE the RURAL because it shows us how to beat the imps of nature when they try to cheat us out of our profits. It is manure and more thoughtful work that we want. My land is rich, but I shall keep manuring it. Farmers here say that manure will heat the soil, and burn and kill a plant. During the Summer the ground is so hot that one cannot walk barefooted on it. I shall haul my manure out in the Fall and turn it under during the Winter. The RURAL is away ahead of our style of farming, but now and then we find a connecting link that pulls us a little out.

Medina, Texas. F. G. W.

WE are advised to do our work thoroughly. That is most excellent advice, but I think it can be carried too far. Some men are so thorough about their work that they get to puttering over it, and spend too much time over little simple things that don't pay. Such men never get ahead. You can't run a dollar business on a cent basis. S. H. J.

Broome Co., N. Y.

THE idea of saying that a strong and healthy young man can make what he likes out of himself is a good one. I believe it fully. That is the way to talk to farm boys. If a man is

tied down by sickness or deformity he can't be blamed for failing; but if he has his health and a fair amount of brains, he has no business to complain of failures. C. B. C.

Ira Co., Mich.

SHAKESPEARE said:

"It is not in our stars, but in ourselves
That we are underlings."

It is well for farmers to think this over. There are more farmers in this country than can be found in any other class of workers. In some of the Western States the right to vote and to be taxed are almost all that is conceded to farmers. The right of railroads, warehousemen and others to fleece them is guaranteed. Why do our lawyers and saloon-keepers have ten-fold more influence than farmers? Because they exert it that they may promote their individual or united interests and aims. English farmers are filling many important Government positions. In America the farmers are expected to occupy the humble but important position of mud-sills, by their own consent. Nine out of ten of our counties and legislation districts are represented by lawyers. They have had so much method in making our laws that an estate cannot be settled, or a note of hand collected, unless an attorney gets 10 per cent or more. However intelligent a farmer, merchant or mechanic may be, he cannot appear as a party in court, except through a lawyer. We have employed lawyers to do our business, until they have bound us "hand and foot." Some forty years ago a law was made in this State, permitting any man to appear in Court, and attend to his own case. Lawyers immediately nullified the law, by a decision that no one can appear in court to attend to business without a license to practice law. Had the law been permitted to stand it would have proved a grand educator of the people, and saved to their pockets many thousands of dollars. Farmers will never be emancipated until they act independently of political parties. Success to the 'Wheel' that is rolling in Arkansas and to the alliances throughout the northwest. They are omens of good. S. W. H.

Madison Co., Ind.

FAILURE—WHERE LIES THE BLAME?

E. DAVENPORT.

Too much whimpering; laying the results of one's own faults at fortune's door; "About Face!"; subscribe for the RURAL*; be honest with yourself—and with others; lots of frozen sense.*

Too much is written and said about the dark side of farming, condoling with the poor wretch who is doomed to toil from sunrise till dark for the bare necessaries of life; with no advantages, social or otherwise, and no money to spend for pleasure or improvement. In a recent article I find such a one described as obliged to endure his hard fate as there is no escape. The author advised him to bear up under the great load for the sake of his dear family dependent upon him for support.

I say to expressions of such sentiments "Bosh!" The chances are that the wife or the neighborhood supports such families. If it be true that hard labor does not bring a measure of success, there is a great leak somewhere, either in expenditures or in energy misdirected. But the probability is that the man in question is a chronic grumbler, loitering perhaps while others are at work. He trades upon credit, and shelters his machinery under the broad, blue canopy, wherever night or the close of the season overtakes it. I will venture that he pastures his cows, his sheep and his hogs in the same field with his horses and along with his geese if he owns any; that the nuts are loose on his mower, and the sickle is dull, that his fanning-mill is old and his wheat turns to chess; that his farm grows rougher, and that he is too shiftless to dig a ditch; that the wet spot in his field grows larger and deeper till the willows spring up and flourish "like the green bay tree." To sum up the whole matter, I will venture the opinion that he has the blues, and is disgusted with his business; that he is working without plans and does not profit by his failures.

Let me say to such a man "Halt! About Face!" Take for your motto "This one thing I Do," and think of it at every job you undertake. Do everything just as well as you know how, and it will be done poorly enough. If you do not know how to do a thing as it should be done, ask some one who does know. Be on the lookout for the best way. Waste nothing. Subscribe for two or three agricultural papers, and read them. If your seed is not pure, get some that is, and keep it so. Get new screenes for your fanning-mill, and your wheat will not turn to chess. Before you take that mower into the field, see that it is in perfect repair. If any part is defective, renew it at once. Keep everything tight. Repair, but never patch. Do not wait till noon to repair a break: do it on the spot, lest the weak place bring extra strain upon the strong. When you put away that mower, make a note of all repairs it will need before another year; then provide them in season. Put it into a house the same hour you finish using it. If your reaper is too old to use and you must have one, buy a new one. Do not give your note for it but buy for cash. Pay money for every purchase, even if you have to hire it. You can buy cheaper, you will buy less, and will take better care of what you do buy.

Do not do two days' work in one, and go fishing the next. Set up your grain so it will endure bad weather. Hire only the best of help, and if you do get a poor man, settle with him on the spot. Never invest in schemes promising sudden riches. Do not speculate. It might be well to buy a dog and feed him on traveling schemers.

Be strictly honest. If you have a cow that is not just what a cow should be, say so when you sell her. Don't let the best of the wheat get on top in the bag. Find no fault with the weather—it is both wicked and foolish. It is as good as if you had made it yourself. Don't grumble about hard times, or get the blues. Other men have their difficulties—be a man yourself. Other men succeed at farming; you can.

Study your business. Quit using tobacco. You have no money to waste; besides, you are going to be too much of a gentleman. Look on the bright side of things. Maybe you have the dyspepsia. You eat too much or too fast. If things go wrong there is a cause. Find it; fix it. Pay every debt the day it is due. Excel in something. Be authority in some line. Do not embark in a new scheme without careful investigation. If you have made a mistake, retreat; but in good order. If you are engaged in a branch that does not pay or is not pleasing, do not surrender without terms. Hold the fort for the honors of war. Cover your retreat, and go out with colors flying. In other words, do not quit a branch of farming in disgust and at a great sacrifice. Wait till the tide sets in a favorable direction for a change.

If you have decided you cannot be a farmer, adopt the same principle. Do not quit in the midst of failure, or the chances are you will fail in the next business you undertake. Go at it with a will. Study it. Wring success out of it. Then change your business if you will. The renewed confidence in yourself will bring success in your new calling, and the chances are it will awaken an interest in the old one. If a man fails utterly in one business, he is all the more liable to fail in the next, for "from him that hath not shall be taken even that he hath."

If not successful look to yourself for the cause and you will usually find it. Compare yourself with some one who does succeed. Don't say "He had a better chance than I." That is a coward's argument. A good chance must be improved to amount to anything. It takes the same energy and attention to save and use that it does to acquire. Some can do more than others; but every man can do well if he will. If you succeed you will be on hand to claim the credit, so if you fail be consistent and shoulder the blame. There is more difference in men than in their occupations. All callings afford more or less opportunities for success and the best of them chronicle many a failure. Look up. Thank God and take courage. Take a lofty view of life even on a farm, and you will respect yourself, be respected, and be happy.

Barry Co., Mich.

Field Crops.

THE WHITE RUSSIAN AND OTHER OATS.

IN the RURAL of August 21st, I notice comments on C. S. Plumb's experiments with oats. I notice also a paragraph in another article in the same issue, which says "Our minds were given us to reason and think; we must not settle that a thing is so just because somebody else says it is. Things that we prove for ourselves are worth twice as much as things somebody else proves for us."

I do not agree with Mr. Plumb's conclusions respecting oats, and do not know that the fact of his being connected with an experimental Station makes his experiments any more valuable than those of practical farmers made on a larger scale. I have read articles written by him before in the Country Gentleman, in which he praises horse-mane or side oats as better than all other kinds; but I consider his theories on the subject unsupported by facts. I have raised oats for 40 years or more, and have tried a great variety of kinds on a large scale and in different soils, and my conclusions with respect to side oats are the reverse of his. I consider the Russian the best of that kind so far as I have tried; but they are so late in ripening as to be generally discarded by farmers in this section. They usually ripen here about the middle or later part of August, and become more or less damaged by rains which are almost sure to come about that time; moreover, they ripen too late to sow wheat after them. They do not stand up any better than the panicle-growing oats, especially the White Australian, which I consider superior in that respect and in every other to any kind I have ever raised. They are the heaviest oats I know of, and retain that quality. I commenced raising them four years ago and now raise no other. They weighed 42 pounds to the measured bushel at first, and this year's crop averages 44 pounds. I never knew White Russian to weigh over 36. The Australian ripen very early. I sowed this year the last of April and commenced cutting the 20th of July, and they were all in the barn the first week in August. I cannot say that they yield better than the White Russian, but they yield equally well, the largest crop I have had of either being 70 bushels per acre by weight. I may change my opinion after further trial: for it requires some time to determine what is the best kind of oats. This is a crop that seems to be affected more than most other grains by soils, seasons, etc.

For instance, the first year I raised the White Australian I had nine acres on a clay loam rather compact soil, and adjoining this piece, on the other side of a fence, four acres of the same kind of oats on a loose, mucky, gravelly soil. The first named piece stood up well, and every rod was cut by the reaper clean, although some of it was over five feet high, and it would average at least four feet. The other piece, on the loose soil, lay almost flat on the ground, and there was much waste in cutting. If I had sowed none but this last I should very likely have thought they were not good to stand. There are conditions in which no oats will stand up well. A loose soil or a heavy shower at the right time will prostrate side and panicle oats alike. It may be well to try experiments on a small scale; but conditions will vary. The chemist in his laboratory may analyze the soil, but the farmer will never know what he can raise on it until he tries The great superiority of the Australian oats is in its weight. As ground feed for horses it is worth 25 per cent more than most other kinds, while in every other respect it is equal, if not superior, to them.

With respect to what Mr. Plumb says about "this oat being boomed extensively" and his remark that "all through Western New York, from Geneva to Niagara Falls, extensive fields of them may be seen lying flat on the ground," I will say it is news to me. I have never known of the variety being "boomed" as much as I have known of his efforts to write it down, and if he knows of "extensive fields lying flat" etc., I do not, and should like more explicit information.

[The White Australian oats were never "boomed" under that name, but as "Welcome" first, and now under several different names as we have stated repeatedly. Our friend is referred to page 626, third column, under What Others Say.—EDS.]

I do not raise Australian oats to sell for seed, and know of no one who does, nor of any "boom" attempted in their favor. I live in Western New York, between "Geneva and Niagara Falls." This year some of my Australian Oats stood five feet eight inches high and none of them were "down." The same is true of my neighbors' who raise them and praise them for precisely the quality which Mr. Plumb says is lacking. They are considered the best to "stand" of all kinds about here, and so long as they continue to do well, we shall continue to raise them, opinions at the Experiment Station to the contrary notwithstanding. WILLARD HODGES.

Monroe Co., N. Y.

CEREAL NOTES.

ARE Martin's Amber and Landreth Wheats the same? As seen in the field, grown side by side, they certainly do appear identical. But in studying varieties I have found it necessary to take into consideration the color of the grain as a diagnostic point. The grain of Martin's Amber is of a decidedly light *amber* color, while Landreth is usually a white or mottled amber and white. The original Landreth, I understand, had a white grain. My seed came from the party originally selling the seed to Landreth. I found that these two varieties were apparently identical in other respects, the spikelets averaging the same in number—18—the grains being about medium size, 1,000 of Landreth weighing 564 grains, and 1,000 of Martin's Amber 529 grains. The panicles of both are smooth, slightly loose, flattened and abruptly pointed.

Considering that the two above are considered distinct varieties, owing to difference in color of seed, the question comes to me—How fixed is the color of seed in a wheat variety? In 1884 I had the seed of a certain wheat sent me from an experiment station. It was of a most pronounced white color. The progeny of the seed planted had just as white a grain as the parent. In describing this same variety, the experiment station that sent it to me classes it as red wheat. I have no reason for doubting the accuracy of the work of the other experimenter, yet this evidence seems only to confirm other marked evidence that some varieties of wheat are very subject to changes produced through being grown under very different conditions—extremes we may say.

[We have received several alleged Blount's Cross-breeds from the Colorado College, the heads being larger and finer than any we had ever seen as raised in the East. These grains, sown at the Rural Farm, were easily recognized as old kinds; Clawson was one.—EDS.]

This variability in color or form may perhaps be illustrated in the case of Washington Glass or Surprise. That sent to me as Washington Glass came from the Ohio Experiment Station, and was certainly larger, squarer, and more compact at the tip than at the base of the panicle, yet seed of this same variety from the Agricultural Department (Rural, Vol. XLV., p. 545,) produced heads of the form of Laudreth. Now, did all this seed originally come from the same source, and by being grown under diverse conditions produce a variable progeny, or have we two varieties sold under the same name.

[We have reason to think that two kinds were sent out as the Surprise in the Rural's Seed Distribution.—EDS.]

I agree that Diehl-Mediterranean is preferable to Mediterranean Hybrid, it being the *original* name, and explanatory at that Yet I thus described it as having been sent me under that designation and as the popular name. If Armstrong is identical with Landreth, the former name should take precedence; likewise the name White Australian Oats should be used rather than Welcome

[We object to Mediterranean *Hybrid*, for the reason that the wheat is merely a cross, not a hybrid. In fact, we doubt whether it is even a cross.—EDS.]

This matter of names is really one of great moment, for the more names a variety has the more deception can be practised by seed-dealers in selling it. Hence the necessity of accurately describing all varieties introduced, and making synonyms where there are no doubts.

[That is very true.—EDS.]

I have grown this year over a half dozen varieties of side-head oats. These are not all later than open-panicle varieties, though, as a rule, they are later. One, called Egyptian, was of medium earliness, the first side-head to ripen, and preceded quite a number of open panicles. I know nothing of this variety, a most excellent one. I found a spoonful of seed in an old envelop, marked "Egyptian Double-headed Oats," evidently left here by some farmer. Grain white, of medium size, plump, short, abruptly pointed, quite different from White Russian, whose seed is long and tapering, and not strictly plump.

During the past two months I have been making very critical examinations of many oat varieties, and taking thousands of measurements of the various parts of the plant. I do not feel justified in saying that the proportion between chaff (glumes) and grain is strikingly variable. Certain so-called rust-proof oats from the South have large glumes, but so have they large, broad-backed grains. The clustered condition of side-head panicles gives the impression of chaff, that the same panicle would not give if opened. I do not think side-heads are chaffier than open panicles, neither do I believe that even the hulless oat has a greater percentage of chaff than the common oat, if we divest the latter of its flowering glume, or tegument.

Is there a rust-proof oat? I have not seen it yet, though I have grown oats under that name from several localities in the South. They all rusted with me. I should like to receive some genuine rust-proof oat seed.

Reports are coming to me that Manshury Barley is becoming more in demand among malsters. If farmers can command a good price for it, it will pay them to grow so productive a variety. Clawson wheat has had to fight the millers in its day. The farmers liked it for its productiveness and stiffness of straw. The millers disliked it because it did not mill to suit them. The millers had to give way to the farmers, and to-day Clawson is the leading wheat in New York State, as well as in other parts of the country. Perhaps the Manshury can be made to command a price if *pushed* to the point by the farmers.

C. S. PLUMB

The Herdsman.

A FINE HERD OF JERSEYS.

WHILE in Rochester, N. Y., recently, our correspondent visited the Grove Place herd of Jersey cattle, owned by S. D. McBride and P. J. Cogswell. The herd numbers about fifty head, and is led by the magnificent Stoke Pogis and Victor Hugo bull, Exile of St. Lambert, 13657. This animal has many excellent points. He is very large, weighing over 1,500 pounds as a three-year-old, still there is not a coarse feature about him. His dam, Allie of St. Lambert, has yielded under test in midwinter, 26 pounds 7 ounces of butter in seven days, and has given 63 pounds of milk per day. Her udder measures 63 inches in circumference. She is a large, beautiful cow, and one of the finest daughters of Stoke Pogis 3rd. St. Lambert is in great demand. Every one sending a cow is required to pay $100 on the birth of a living calf. Mr. E. J. Larrabee, of Albany, N. Y., has sent four of his finest animals there this year, and ex-Congressman Greenleaf, of Rochester, had two fine cows there when our reporter visited the herd. All of the young things that have descended from the herd of McBride and Cogswell this year and last are sired by Exile of St. Lambert, and show a remarkable resemblance to each other. The calves were all large and healthy, and without exception showed a good udder development. Over 95 per cent. of his get are of solid color, and nearly the same percentage have been heifer calves.

At the head of the RURAL'S premiums offered to subscribers last year was a Jersey bull from this herd, which Mr. E. Williams, of Montclair, N. J., won. The calf is a strong, healthy, vigorous animal of solid color with full black points, sired by Exile of St. Lambert, and is to be called Rural Prince.

Our reporter's attention was attracted to a large cow of the Victor family, which had a fine escutcheon, and also to the dam Eva Locust, 21050. Many of the young animals in this herd can be traced to Coomassie, Alphea, St. Helier 45, Welcome, Jersey Belle of Scituate, Albert 44, Pansy 8, Favorite of the Elms and other famous strains. All of the young heifers have been bred to Exile. Attention was also called to Waiter Girl, a large, beautiful, silver-gray cow, which lately tested at the rate of 20 pounds 2 ounces of butter in seven days. Her bull calf seemed a very desirable animal to head a herd, as the average record of his own dam and sire's dam foots up 23 pounds 7 ounces of butter in seven days.

HEREFORD CATTLE.

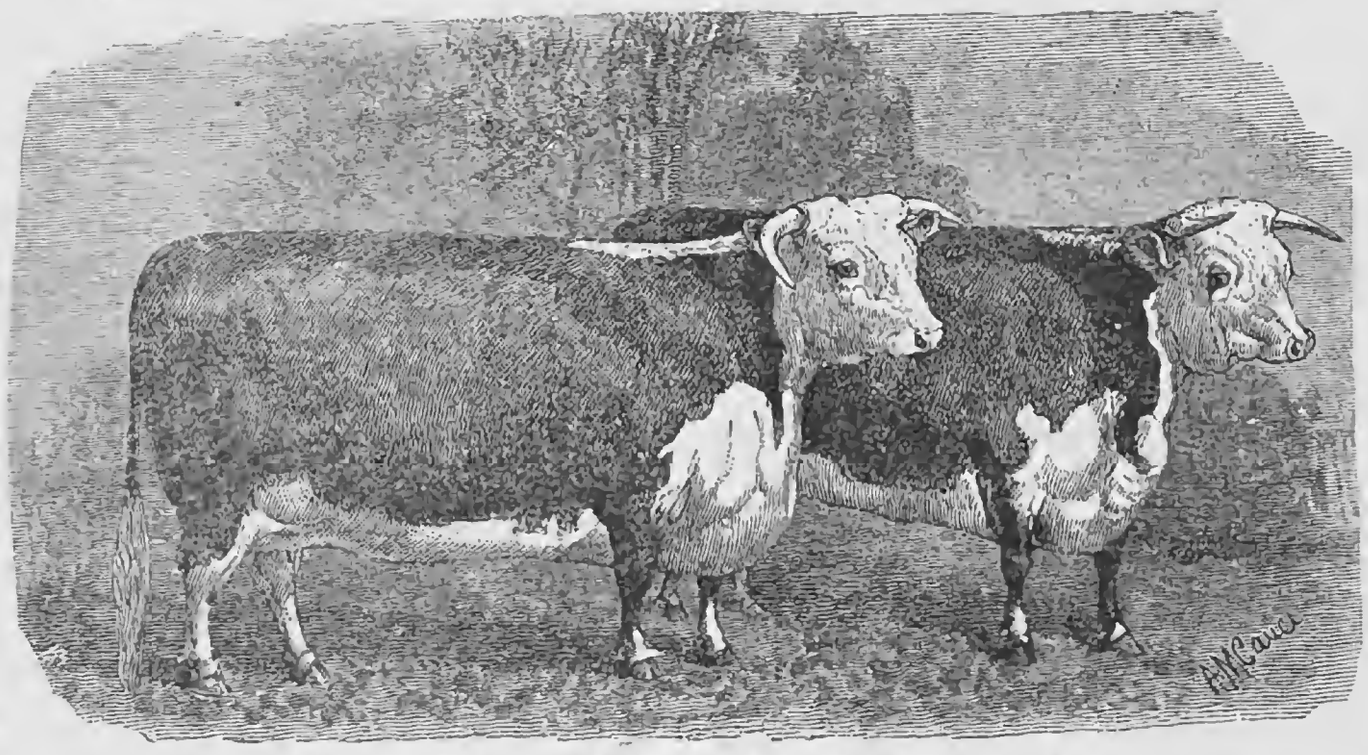
THE Hereford is treading close on the heels of the Short-horn. As a beef breed many consider the former on a line with the latter, or even a little ahead. The earliest notices of the White-faces praise them for their large size, hardiness and excellence as draft animals, as well as for their aptitude to fatten readily, and for the superior quality of their meat, beautifully marbled by a desirable admixture of fat and lean, and for their profitableness as feeders, as it has long been claimed that in proportion to the feed, they lay on more flesh than any other breed. Beyond rare notices of this sort, little is known as to the early history of the race before the opening of the present century.

They are, no doubt, to a great extent, an aboriginal race bred for ages in the county from which they get their name. It is generally thought that they belong to the same stock as the somewhat smaller cattle of Devon and Suffolk, and like these they were originally a solid red. As these counties are a considerable distance away, however, and other breeds were common in the intervening country, there are some doubts on this point. The present characteristic markings of the breed are of comparatively recent date; for late in the last century and early in the present, there were Hereford cattle of dark red or brown color with scarcely any white, as well as others with mottled faces.

In the History of Hereford Cattle just published, the authors, after a full rehearsal and comparison of all attainable information, say that a review of all the circumstances connected with the origin and development of the breed seems to establish the fact that it was founded on a variety of aboriginal cattle of the type from which the Devon and Sussex breeds have been derived. At an early period White Welsh cattle, larger in size, and probably of foreign extraction, were introduced and mixed with the stock of Herefordshire, imparting a tendency to white markings, and enlarging the frames of the native breed. In 1671 Lord Scudamore introduced from Flanders a number of red cattle with white faces, which "strongly accentuated the white face," without rendering it universal. This cross probably also increased the size of the breed. During the 18th century other districts of England were resorted to for stock, as we read of the introduction of Gloucestershire, Devon and Montgomery blood into the race.

Like nearly all our most valuable modern breeds, the Hereford would therefore appear to have been the result of judicious amalgamation of various good sorts, both home-bred and foreign. Various elements were grafted on the native stock, stimulating the development of better properties.

It was in 1760 that Robert Bakewell, of Dishley, Leicestershire, at the age of 35, succeeded his father as proprietor of the Dishley farm; but he had already obtained some reputation as a breeder, which was soon greatly increased. His example and the results of his labors stimulated not only the Collings and other early Short-horn breeders, but also the breeders of Herefords. Down to the close of last century cattle in England were bred more for excellence before the plow or the wagon than in the dairy or the shambles; and Bakewell was the first to devote his attention to the production of animals that would mature early, lay on fat readily at the lowest cost for feed, and give generous results at the pail; and to accomplish this object he was the first to employ a scientific method of breeding.



HEREFORD CATTLE. From an old picture. Fig. 365.
Re-engraved from the "History of Hereford Cattle," page 194.

What the Collings brothers were in the improvement of the Short-horns, the Tomkins, father and son, were in the improvement of the Herefords. The elder Tomkins (Benjamin) is supposed to have begun breeding about 1742, and had a large measure of success, but his son, Benjamin Tomkins, the Younger, was by far the more noted breeder. His herd is supposed to have originated in 1766 from stock purchased in the neighborhood of his farm at King's Pyon, Herefordshire, and though he paid little attention to color, and early in his career was not particular about introducing the blood of other Hereford strains, or even of other breeds, he left at his death, in 1815, what was considered the finest herd of Hereford cattle in existence. After this had been greatly reduced by private sales, 28 head were sold by auction in 1819, and averaged £149 each. At Charles Colling's sale at Ketton, in 1810, the average of 47 Short-horns was £151,8*s.*, and at Robert Colling's sale at Barmpton, in 1818, 61 head averaged £128, 17*s.*, 10*d.*, and at his sale in 1820, 46 head averaged £49, 8*s.*, 7*d.* So that the prices at the first great Hereford and Short-horn sales were hardly in favor of the Short-horns.

Other eminent Hereford breeders, contemporaries or survivors of Tomkins, and whose names and strains are still honored in Hereford circles, are Galliers, Tully, Skyrme, Price, Hewer, Jeffries, etc.

The cows Dorothea and Theodora, Fig. 365, winners of the first and second prizes at the Royal show of 1884, are specimens of the breed. As will be seen, the face, throat, chest, belly and part of the legs with the crest of the mane and tip of the tail, are white. Countenance pleasant, and open, denoting good temper and that quiet disposition essential to economical fattening. Head small in comparison with the rest of the body. Chest deep and full. Shoulder-blades thin, flat and sloping towards the chine, and well covered with mellow flesh. Chine and loin broad. Hips long and moderately broad. Legs strait and small. Rump forming a straight line with the back. Thighs full of flesh to the hock. Flanks deep. Ribs well sprung. The whole carcass covered with rich, mellow flesh. Hide thick, yet mellow, well covered with soft, glossy hair with a tendency to curl. Horns such as are borne by the "middle-horned" class.

STOCK JOTTINGS.

IMPORT DUTY ON CATTLE. — Considerable indignation prevails among the stockmen of the Northwest at the recent imposition of a 20-per-cent. tax by the Canadian Government on importations of American cattle, and threats of retaliation are made. A number of stockmen finding the American ranges over-stocked or the grass in poor condition, have crossed the line into the Northwestern Territory, where better pasturage can be had for little or nothing, and they are greatly displeased at finding that if they drive their herds across, they will have to pay this duty. But this tax has really been legal since 1878, though it is only of late that it has been "oppressively" enforced. We levy a duty of 20 per cent on all live stock imported from Canada or any other country, and the Dominion is merely retaliating. Canadians themselves have to pay the same tax on imports from this country, and Americans importing stock into the Dominion are merely placed on the same footing as Canadians. Some time back, owing to fear of pleuro-pneumonia, the importation of American cattle into the Dominion was absolutely forbidden under any conditions without undergoing a quarantine; but this regulation has been relaxed in reference to Northwestern cattle. Our Treasury Department has lately issued orders for the stricter enforcement of the duties on cattle from "contiguous foreign countries," and Canada has simply followed our example.

SEA TRANSPORTATION OF LIVE STOCK.—A considerable number of the transatlantic steamers are now fitted up with special reference to the transportation of live stock with much less risk of injury and far more regard to comfort than even a year ago. Speed is recognized as an important consideration at sea, as greatly lessening the risk of loss, which other things being equal, is always heaviest when the animals have been weakened and demoralized towards the close of the voyage. Lately the new steamer Alcides, built and fitted up as a first-class live stock boat, made the round trip between Glasgow and Montreal and discharged both cargoes within a month—an unprecedented feat. She had 141 horses on board—mostly Clydesdales—besides a lot of cattle—chiefly polls. Montreal is becoming a favorite port of debarkation with American as well as Canadian shippers of live stock. The distance to the mouth of the St. Lawrence is less than that to Boston or New York; the water thence is smooth; the animals are carried far inland; the railroad routes to the homes of the importers are usually shorter and more convenient, and as the animals are "for breeding purposes," there is no trouble about bringing them into the United States duty free.

RESCUE OF STOCK FROM FIRE.—Scarcely a week passes without accounts of heavy losses of cattle and horses confined in burning stables. In a few cases the animals become so dazed and frightened that they would not escape through an open door if loose, but as a general thing they might be saved if they were not tied; and often it is too risky a business to enter the burning building to untie them. Lately an ingenious contrivance for releasing horses, cows and other stall animals, in case of fire, has been invented by Mr. Frederick Chawner, of England. Inside a tube, which is fixed underneath the feeding trough, runs an iron bar, and to this, in the center of each compartment, a hook is welded. By means of an aperture in the tube the halter-chain may be threaded on to the hook. In case of fire the animals may be instantaneously released by any one outside the building by drawing out the rod three or four inches, for the hooks being drawn past the aperture, the halter-chain or rope falls to the ground. To farmers and the proprietors of large stables, the invention is an important one.

THERE must be a good deal of dissatisfaction with recent methods and objects in Short-horn breeding in England, when a Short-horn enthusiast suggests (in the L. S. J.) that the Short-horn Herd Book Society should burn its 31 volumes and begin afresh. This would be a truly heroic way of getting rid of the "pedigree" incubus. But what, he asks in desperation are Short-horn men to do to keep in the race, while they are being beaten "all round"—by Herefords in the Southwest and Aberdeen-Angus in the Northeast. Can American Short-horn men answer the conundrum?

AYRSHIRE cattle won the champion milking prize at the Bath and West of England Show the other day. Why don't the English Agricultural societies have separate classes for this valuable dairy breed? Why don't Ayrshire breeders call more attention to their merits on this side of the water?

A South American buyer purchased three yearling Booth Short-horns and a bull at Warlaby the other day.....A draft of 45 of the Aberdeen-Angus herd of Sir George McPherson Grant of Ballindallock, Banffshire, Scotland, were sold by auction on September 7. Among them were specimens of the Erica, Pride, and the other famous families of the herd. In spite of depressed times the prices were satisfactory. .....Who knows anything about a race of "white-polled cattle," said to be now bred in Erie County, New York? They are reported to be good milkers and beef producers, and it is said to be the intention to improve, refine and pedigree them.

DEVICE FOR HOLDING A BULL.

A FRIEND, whose address we have unfortunately mislaid, sends us the device shown at Fig. 363, p. 625. It was suggested by the picture on page 526, illustrating the riot which takes place in a barnyard when an ugly bull once gets his head down. The device is fully shown in the picture. A small ring is fastened into the nose ring and connected with a strap which passes up over the head to be fastened to a surcingle just back of the shoulders. It is impossible for the bull to lower his head, and he can be led with safety. It is not intended that the head should be held up all the time, but only when the animal is being led from place to place. It will be handy to use in leading ugly bulls to the fair.

Dairy Husbandry.

COMBINED ICE-HOUSE AND MILK-ROOM.

OUR ice-house and milk-room combined cost us about $25, not including labor. The outside dimensions are 10x18 feet. The uprights—all 2x10 inches—are set two feet apart edgewise. Siding is nailed to the outside and lining to the inside, thus making a dead air-space of 10 inches. The roof is made of half-inch stuff laid like clapboards with about eight inches to the weather. A partition of inch stuff runs through the center to the hight of the eaves, thus making the ice-house eight feet square and the milk-room the same size. The floor of the ice-house is made of clay, rammed hard, covered with six inches of gravel and four inches of sawdust on this. The ice is surrounded on all sides with six inches of sawdust packing. A small window at each gable end and a small box running up through the center furnish ventilation. Shelves along the partition allow for shallow milk setting. In one corner of the milk-room, towards which the floor of the ice-house slopes, is placed a tank for deep setting. This is 20 inches wide, two feet six inches long and two feet deep. This will hold five or six five-gallon cans. It is an ordinary dry goods box caulked, and given a coat of asbestos, and sunk into the ground to receive the drip from the ice-house with an outlet at the bottom emptying into a drain. When the drip from the ice-house is not sufficient, water is put in from the well. The cans are made by a tinsmith. They are 8½ inches in diameter and 19 inches deep. They are fitted with tight covers and have little balls

of solder at the bottom so that the water can flow under as well as around them. The handles are made of copper wire. The cans cost 75 cents each. M. E. L.

Putman Co., W. Va.

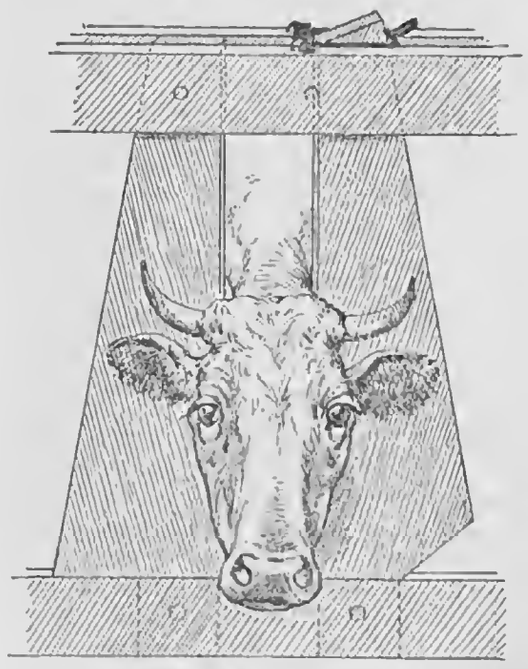
ANOTHER IN FAVOR OF THE GENERAL-PURPOSE COW.

I want to vote in favor of the "general-purpose" cow. Such an animal is not only possible, but profitable. I have never seen anything that came nearer such an animal than good Short-horn or Holstein grades. A cross of a thoroughbred bull on our common cows gives an animal that is hard to beat when you take cheapness, hardiness and general worth into consideration. People who advise farmers to keep nothing but thoroughbred stock do not tell the whole story. We have to get down to the intrinsic value of cattle. We have no time to raise pedigreed stock and but little money for advertising. It will be hard to find thoroughbred cows that can turn more food into milk and butter than my grades can. C. P. S.

Essex Co., Mass.

FASTENING FOR STANCHION.

Mr. William Petrie sends us a sketch of a stanchion-fastener which is in use among his neighbors. We show it at Fig. 364. It is



R. N-Y.

Fig. 364.

made of ⅜-inch iron and attached to the stanchion by means of two staples. These staples are just large enough for the fastener to play in. It will be seen that the end of the iron is turned up, so that when the upper part of the stanchion strikes against it, it rises and falls again of its own weight. It can be easily raised to liberate the cows and will hold them securely. Any blacksmith should be able to make them.

Veterinary.

MUD POISONING.

In Montgomery County, New York, there has been some alarm among farmers for fear "black-leg" had broken out among the cattle. The cattle got lame; then the legs swelled and at last became covered with sores. This is a good description of the effects of mud poisoning which is sure to follow if cattle are obliged to wade into mud holes or ponds to get water. The beds of creeks and drinking places, where the mud has accumulated, and all pond holes from which the water has dried out will poison the feet of cattle and also the skin on the legs. The soreness will begin between the toes, and this will cause lameness without any discernible cause, and then the more tender skin on the hind part of the legs will crack, and with the irritation of the flies and the mud a rapid inflammation follows, and the leg swells and now becomes hot and feverish and swells badly.

Cattle will seek these moist and cool places to stand in when not thirsty. In the early stages of the trouble, washing the feet clean and greasing between the hoofs will cure, and the same treatment will also heal the legs; but when the inflammation becomes severe the animal should have regular doses of Epsom salts daily, and be kept in a dark stable, or the legs should be bound up to keep the flies away, and washed daily with a weak solution of carbolic acid, and be well smeared with salted grease. In droughts when water is scarce is the favorable time for mud poisoning.

F. D. C.

Horseman.

THE HORSE UNDER A CATARRH.

Horses that have been in moderate service during the hot weather, especially if they have been well fed, are generally in that condition termed "soft," and as the fall weather comes on with its customary cold winds, horses are very liable to contract catarrh, from being driven till a little fatigued or till the skin is giving off moisture freely. When evil effects follow, these come in one of two ways, or may come from the two combined; namely, from a chill upon the relaxed surface, sending the blood inward upon the delicate lining of the air passage, resulting in congestion and followed by inflammation, and constituting catarrh of the air passage; or it may, and sometimes is caused by the cold current of air entering the lungs, acting directly as an irritant upon the delicate mucous lining.

When the horse has contracted catarrh, what is it, and what may it lead to? It is simply an inflammation of the mucous lining of the nasal cavities; or at least this may constitute a catarrh in itself sufficient to cause a degree of fever, perhaps raising the pulse from its natural beat of about 40 per minute, to 50 or 55. In such a case, a careful observation of the respiration will show this is quickened; the nostrils will be seen to be red and expanded on expiration, and the flanks will be drawn in, and will be pushed out a little more than ordinarily. Now this breathing keeps tally with the pulse and the temperature, the latter being quickly seen if the thermometer be brought into requisition.

Catarrh means more than this. It may fix itself upon the deeper-seated air passages, and then we have bronchitis—pneumonia may not be far off. The owner, after having driven sharply against a cold wind; or, having warmed his horse to the free-sweating stage, then permitted him to stand in a cold current long enough to give time for the animal to cool off, will act wisely in watching the horse's movements carefully. If, on continuing his drive, he observes now and then that the animal slackens his pace, moving with less spirit than is his custom, and especially if on driving to the stopping place and unchecking him he at once drops his head low down, alternately partially elevating and putting it down again, he had better put him in a warm place at once, try his temperature and pulse, and if these are going up, he can readily detect this, and the quickened respiration will be additional proof if any is needed. In such a state the horse will leave his feed, stand as though under some distress, and many a valuable horse is lost for the want of a little skillful attention at this particular juncture.

What to do? Buckle a woolen blanket around him, and in place of drenching him with physic—salts or any other thing—as many would advise, simply give him the tincture of aconite root, ten to fifteen drops each half hour in a little water, the dose to be large or small, as the heat and pulse are high, or the opposite. Watch the pulse, and as you observe that it is diminishing in frequency, graduate the dose accordingly. Keep the heat down for a few hours, or a day and night, and a threatened serious trouble may be averted—namely, pneumonia or bronchitis. WESTERN.

PIG ATTENTIONS.

COL. F. D. CURTIS.

The most trying time for pigs is when their mother's milk is not sufficient to satisfy their growing wants and when they are old enough to eat grain and assimilate it well. A very young pig needs milk, and nothing agrees with it so well as that of its own kind. After it has sucked its mother a few days, or even a few times, it can be made to live on cow's milk; but it must not be fed over a few teaspoonfuls at a time or it will have colic and die; and if it does not die, it will be a poddy and forlorn-looking thing.

The same is true when fed grain while it is young. It will get a big stomach, and be hollow in the back and grow out of shape. Pigs will begin to eat grain when three weeks old, and at first a few kernels are all they should have at a time. Corn is good, but oats are better. The very best meal is fine wheat middlings, and they should be well mixed and not diluted, so that it will take a considerable bulk of swill to satisfy their hunger. Bulk or stuffiness will make big, bulging stomachs and give pigs a miserable appearance. Where there is plenty of cow's milk for pigs all this particularity is not necessary, as they will do well on the milk with a little middlings mixed in, or on the milk alone. It is well to feed a little corn or oats together with the middlings, but it should be given between times. Pigs will always do better when allowed to run in the grass, as they will eat more or less, and it has a laxative and cooling effect.

It is always an injury to pigs to compel them to squeeze through holes under the fence or in any place. It tends to make them hollow in the back, and it hurts their stomachs and will often make them sore in the sheath on account of it being bruised on the ground. The trough should always be set in a clean place, and be kept clean. It should be just high enough so that the pigs can reach into it without humping up their backs, or being obliged to put their feet in. Pig feeding of this sort isn't profitable. When confined in a pen the pigs should have some fresh grass or weeds every day, and a liberal bedding. Weeds are made for pigs to eat and convert into manure, and a farmer who wants to turn things to the best account will keep his hogs supplied and so utilize them in the best manner.

The bedding is important to enable the pigs to lie more comfortably and to afford rest to their feet and legs after standing on the hard floor. This is one item in pig attentions which must not be omitted, or there will be stiffness or falling away in condition. It is not essential to sour the food of young pigs as of old ones. As the bulk is so much less in the stomach, there is less fermentation and flatulency. When large quantities of meal or middlings are continued, the work of fermentation should not all be left to be done in the stomach. The softening also helps digestion. It is better to have the pigs in small bunches, not more than 10 in a pen, or 20 in a field.

ALTERATION OF NAME.

There are in England no longer Large, Middle and Small Yorkshire White breeds of swine. The word Yorkshire has been dropped, and it is not unlikely the Large and Small White breeds will soon be dropped also. These, though the original breeds, are fast losing ground in public favor. The former is considered too large and coarse, the latter too small and stunted to please the general buyer. The number of Large and Small Whites at the public shows has lately fallen off, and less care is noticeable in their breeding. The Middle White is fast eclipsing the two other breeds by the crossing of which it was produced. By this crossing greater size has been obtained on the one hand, and a better quality of flesh on the other. The reason assigned for dropping the name Yorkshire is that these breeds have been continually crossed with Suffolks and other white breeds, which, whatever their merits and pedigrees, were not in any way allied to the Yorkshire.

The Poultry Yard.

CHICKS DYING IN SUMMER AND FALL.

It has been noticed by some that while early-hatched chicks have made good growth, with but little care, the late chicks begin to die when about two weeks old. The natural supposition is that the trouble is caused by lice, which is true in many cases; but there have been instances in which even the best of care, with freedom from lice, did not save the chicks. Those hatched under hens are not safe, but as the broods in the brooders are larger in number, and receive the direct attention of the poultryman, the trouble there is more particularly noticed.

To get at the root of the difficulty it may be stated that chicks hatched at either too low or too high a temperature will come weak, and though this fluctuation is often a fault of some incubators, the same may be said for the hen. Some hens do not generate sufficient heat, while others, when very fat, keep the eggs too warm in Summer. When the chick is hatched under these disadvantages, the yelk is not sufficiently absorbed, and though the chick may pass over the difficulty yet it is liable to succumb whenever the conditions in the brooder are unfavorable. One of the principal causes of failure is that because the weather is warm the chicks are not given sufficient warmth, while those with hens are dragged about and fatigued by the dam's following the strong and lively chicks from place to place. Even in the warmest days of August young chicks require warmth in the brooders, which may be observed by their crowding together. If heat be lacking (and they only want a little) the result will be cold on the bowels, and death is attributed to constipation. No mode of feeding will save chicks affected in this way. They become droopy, refuse to eat, and die. It is safe, however, always to look carefully for lice, as the vermin work when unseen.

Another point frequently overlooked, is that when the cocks and hens are moulting they are debilitated, which accounts for the failure of eggs to hatch, and even when there is a limited number of chicks from eggs in the Fall, the debility is passed to the young, and they come into the world enfeebled and lacking in vigor. As insect food is usually plentiful, but little meat is fed to the chicks, which is a mistake. At least three times a week chopped meat should be given the adults and chicks. All birds, even those that feed exclusively on grain, provide animal food for their young until fully feathered, and if this rule was observed in the case of chicks they would make better progress and the loss would be smaller.

Keep the chicks warm and dry, even in the Summer and Fall; give animal food; provide water in a manner to prevent them from getting wet, and avoid dampness. In using eggs for hatching, put a cockerel of last Spring's (early) hatch with two-year-old hens, removing the old cocks, and there will be a larger percentage of chicks. The early spring broilers should be hatched from November to March. P. H. JACOBS.

BREEDING WYANDOTTES.

I beg to differ from J. H. G., in a late Rural, as to the above breed losing its popularity. I find Wyandottes are growing in favor continually. I know not what luck people in general have had in hatching chickens from eggs purchased at a round price. I buy none but high-priced eggs to renew the blood for breeding purposes; but I do not always get the best-marked birds. In April I bought one setting for $5; result, three chicks. I notified the breeder of the hatch and sent $5 more and received 16 eggs, from which I hatched eight chicks. I have raised seven of them. They cost on leaving the shell $1 each. They are nearly all good breeding birds. I would not sell them now for $3 each, or take $30 for the lot.

I next sent to a dealer $8 for eggs from his best stock. I received 16 eggs and hatched eight chicks. One died, leaving seven for eight dollars. There does not appear to be a prime bird among the lot. I have much better from my own stock. So much for costly eggs.

The eggs I have sold this season from the best pens cost $3 for 13; from the other pens, $2 for 13. I have had no complaint of lack of fertility; nor have I heard of a setting bringing less than eight chicks except where a customer notified me that a hen had left her nest and spoiled all of them.

J. H. G. cannot be a novice from his style of writing, but from some statements contained in the article I must conclude he did did not pay $5 for his setting of eggs; they must have been eggs sold at a very low figure. No careful breeder will sell eggs from thoroughbred stock which will produce such bad results. I have heard of only two white (Albino) Wyandottes hatched from all the eggs sold by me this season. True, they have not yet been bred according to the standard for a sufficient time to perfect the breed; but nineteen-twentieths should breed true to color. I have, on an average, met with as good success in hatching and markings from eggs sold at $2 to $3 per setting as from those bought from so-called first-class breeders. On one occasion I bought from a noted strain three settings that cost me $10, each setting being marked as from separate pens. Two settings bought 18 chicks, one setting nothing. All were hatched in the same incubator at the same time. Not one of the chicks would score above 85 points, while many chicks from my $2 eggs scored from 90 to 93 points. It no doubt often happens that high-priced eggs are sent from second and third quality mating birds.

Eggs from good birds are sold by many breeders at $3, and even $2 per setting; but all the eggs at these figures are not from good birds, and eggs at $5 per setting do not in many cases give satisfaction, but in all cases Wyandottes should show their origin, except an occasional Albino. They have come to remain, and even if irresponsible parties occasionally sell a mixture of eggs for pure-bred, they are nevertheless bound to grow in public favor. WYANDOTTE.

What Others Say

DAIRYING IN ENGLAND.—Prof. L. B. Arnold, our well-known dairy authority, has just returned from a tour among the dairy counties of England. In a very interesting article which he contributes to the New England Homestead he says that the factory system has been growing in England since 1869, but the number of factories has only got up to 80 in the 17 years it has been progressing, and yet they seem to be doing fairly good work; judging from the few factories visited and the cheese seen, they are turning out quite as good work as the factories in the States, but not as good as the Canadian factories, especially those in Western Ontario in the neighborhood of Ingersoll. The best cheese Prof. Arnold met with was from Western Ontario, and it everywhere took the lead in reputation and price. Not all the cheese, however, from Western Ontario was fine. All he saw that was made on the old acid process, still too much in vogue in Canada as well as the States, was no better than State or English cheese, if as good. It was the cheese made by drawing the whey sweet and giving the curd a long ripening after it is out of the whey, by keeping it warm, that has given Canadian cheese the good name it has acquired, and it seems a pity that other factorymen, and especially our own, are so slow in adopting it. This process is as much superior to the acid process as the factory system is to private dairying, which the English dairymen are adhering to with a tenacity that looks to us like a blind and stubborn conservatism, but many of our own factorymen show a conservatism equally blind and stubborn in their stupid continuance in the old acid rut. Whether the product is butter or cheese, so long as the bulk of it is made in families, there will be about as many varieties as there are families making it, and while some of it may be fine and as fancy as it is possible to make, yet the bulk will always be inferior because the great majority of makers are not experts. A few can always be found in any community more skillful than the rest, and it is the submitting the milk of the many to the skill of these few that gives the associated system an advantage in quality and uniformity over private dairying, that it will always retain. So long as the English stick to their present preference of making cheese in families, the great bulk of it will continue to be inferior to that made by their kin in America who associate and employ their best experts.

In the midland counties where most of Prof. Arnold's time was spent, English butter was not quite as high-flavored or as high-colored as American butter, either States or Canadian, when all were uncolored and otherwise made alike. A rich soil, all other conditions being equal, contributes to richness of milk and to high flavor in butter, and seeing that the soil averaged richer in England, he anticipated finding higher-flavored butter, and was surprised and at first a little puzzled to account for its being lower-flavored instead, but after studying the situation awhile, he thought he saw two causes operating to produce the unlooked-for qualities. One of these was the want of sunshine and hot weather.

In England there is more cloudy and foggy weather than here, and the grass there gets much less sunshine. England has a more equitable climate than we have. It is warmer there in Winter and cooler in Summer than with us. Flavor in grass, as in fruit, is the combined product of sunshine and warm weather. Other circumstances may modify the flavor of grass, but where all other conditions are equal, the lower the temperature at which it grows the less flavor will develop in it.

The other cause modifying the butter of England is the breed of cows employed in its production. In the midland counties they are nearly all Short-horns, and many of them pedigreed animals. That breeds, as well as species, mold the flavor of their milk differently is a fact well understood. The difference between the milk of different species is wider than between different breeds of the same species. The milk of a mare and a cow differ more than the milk from different breeds of either species, but that the Jersey, Devon and Kerry cows give milk which makes higher-flavored and higher-colored butter than Dutch cows and Short-horns is plain, and the difference between Short-horns and the common American cows, though less distinct, is wide enough to be distinctly appreciated, and to be recognized as a sufficient cause for a difference in the butters made from the milk of two kinds of cows.

Prof. Arnold does not make this comparison to speak disparagingly of English butter as compared with American, or as being in any sense poor when taken as a whole.

English butter is no more uniform than our own, but though originally not possessing quite as much flavor as ours, as an average it goes upon the table to suit his taste and the taste of the average human, better than average American butter does. He considers it a vitiated taste that calls for crowding an ounce of salt into a pound of butter. Even a mild taste of butter is more palatable to him than the taste of salt, and he believes this is true of all the world outside of America. The English, so far as he saw, use butter with very little or no salt. Whatever good there is in it is in a condition to be appreciated and enjoyed by the consumer. It is neither covered up nor warped by an overdose of salt, and that meets his choice exactly.

BALDERDASH.—"When the dairymen undertook to say that the laboring poor, who, from necessity rather than choice, must use the substitutes for butter or eat their bread and potatoes dry, shall contribute of their poverty two cents on every pound of it to the support of government to protect their interests, it is going a good deal farther than they have any right to. It is an encroachment upon the rights of others" to which a writer in the New England Farmer, objects to being a party. "The wrongs of the dairymen can never be righted by wronging the poor," says he.

"From necessity rather than choice," the "laboring poor" have to use tools, household utensils, clothing, etc., the price of every item of which is increased by the heavy duties levied on lower-priced foreign rivals for "the support of government to protect" the interests of American manufacturers. The tax levied on oleomargarine for the protection of the dairy interests of the country—to enable struggling dairymen to make a living by forcing the manufacturers of "oleo" to deal honestly—will not amount to much over $600,000 a year; the tax levied on the other home-made goods of the country to protect manufacturers so as to enable them to pile up more millions, runs up high among the millions every year. How is it that we hear so little about the heavy tax which the poor are forced to "contribute of their poverty" towards the vast fortunes of our manufacturers, while we hear so much about the slender contribution they make to enable equally hard-working dairymen to live, as well as to protect themselves from fraudulent imposition? But will the "laboring poor" really have to pay more for this "substitute for butter on their bread and potatoes," because of the two cent tax? We think decidedly not. As a rule they have hitherto had to pay butter prices for the concoction; after the new law has gone into force, they will have to pay only oleomargarine prices for it. There is little doubt that prices of oleo will be lower after November 1 than at any former time in spite of this two-cent tax, and if the "laboring poor" really hanker after the stuff itself, its sale is likely to increase rather than diminish. All this gabble about "protecting the poor man's food," legislating against one American interest in favor of another, etc., is mere balderdash so long as it is confined to one out of many cases.

EPILEPSY.—From National and State statistics, and from the number of inquiries sent to us with regard to the merits of nostrums for the "cure" of epilepsy, it is very evident that this disease is one of the greatest curses of the human race. At a meeting of the British Medical Association at Brighton, England, on August 17, reported by the London Times, Mr. Victor Horseley, F. R. S., Surgeon of the National Hospital for the Paralyzed and Epileptic, exhibited three patients who had long been suffering from severe epileptic fits and who had been cured by Mr. Horsely by opening the skull and removing the diseased structure or new growth from the brain itself. The operation is regarded as opening a new era in surgery, promising to rid the human race of this terrible disease. In all cases the operation was not difficult, and the recovery was speedy without any retarding symptoms. As the operations are of recent date, there has not been time to prove that the cures are permanent. What is actually proved at present is that it has become possible, by the observation of symptoms, not only to determine the fact of the existence of some morbid growth within the skull, but also to determine its precise position with such accuracy that it can be cut down upon and removed. It is also proved that considerable portions of the brain may be removed without injury, the functions to which these portions are subservient being performed, after a while, very possibly, by corresponding parts of the opposite hemisphere. Two of the patients had been injured, so that there were external indications; but in the third there was nothing of this kind, and the point at which the skull should be opened was determined solely by the fact that the fits commenced in a particular group of muscles—those, namely, which act upon the left thumb. The physician in charge of the case was able to say that this manner of commencement pointed certainly to the presence of a continuing source of irritation near the surface of the brain at a definite spot; and, the surgeon having opened the skull at the point indicated, a tumor was found imbedded in the brain substance, and, together with a portion of the brain surrounding it, was removed, so far with absolute cessation of the fits, which were previously not only very frequent, but, as might have been expected, were also increasing alike in frequency and severity, and were such as to disable the patient from following any occupation, not to say that they placed his life in constant jeopardy from accident. By experimenting with electricity on living animals rendered unconcious, it has been found that the brain surface is largely made up of "motor areas"—regions which excite movements, each in its special part of the body, so that a skillful experimenter by stimulating in succession different parts of the brain can cause a narcotized and therefore unconscious animal to perform a considerable variety of actions with perfect precision. Horseley, knowing what part of the brain caused the movement of the patient's left thumb, cut down on that spot and removed the tumor that caused the epileptic movement.

RATHER MIXED AS TO OATS.—We have just received a bulletin from the Ohio Ex. Station, which presents the yield of 29 kinds of oats, or rather of oats with different names. Badger Queen, at the rate of 75 bushels to the acre; Clydesdale, 66; Racehorse, 53; Welcome, 41. THE RURAL has found these all the same, viz., the White Australian. Are we mistaken? The report makes no mention of their being the same or even of resembling each other, further than is shown by the fact that they all ripened at the same date. The difference in yield, supposing them to be the same, and that they were treated the same, is surprising. Neither is there any mention of the fact that Yankee Prolific and White Russian are the same. Is it not as important that farmers should know that a certain kind of oats is sold under half-a-dozen different names and at as many different prices, as that they should know the difference in yield, weight of grain and straw, and time of ripening, all of which is owing either to a difference in the quality of the seed or the soil? If Welcome had been sown upon the Badger Queen plot, no doubt it would have yielded 75 bushels instead of 41!

According to the bulletin, Black Russian oats yielded 85, Black Tartarian 63, Early Dakota 62, Early Prize Cluster 61, Probsteier 70, White Schœnen 52, White Victoria 57 bushels to the acre. The bulletin says that the average yield and weight per measured bushel of the early ripening varieties are greater than of those that ripen late.

DOGS TOO MANY; DOLLARS TOO FEW.—In 1880 there were 625 Indians in Maine, of whom 312 were males and 313 females. Every able-bodied Indian in the State has a dog and every Indian who is not able-bodied has two, says the Lewiston Journal. They play the old Nick with the sheep of the neighboring farmers and run down a few deer. They are the homeliest, gauntest family of dogs in the State. A man in Perry recently lost 26 sheep by the teeth of these curs and made a row about it. He went to the Indians and threatened to sue them. They laughed at him. One old Indian addressed him as follows: "White man everything; Indian nothing. What going to do?" The argument was unanswerable. Change the names and, with some modifications, isn't the story true of your section also, reader?

THE FLY TORMENT.—Of all sorts of cattle subject to suffering from flies, fattening stock and those at fairs are most to be pitied. In spite of the best care, fine-skinned animals will lay on little flesh unless they are in some way protected from these pests. If "fly nets" or sheets cannot be used, it is found that the animals will not be worried much in the stable or at pasture, if they are sponged every morning with the following wash: Kerosene, half a pint; water, three gallons; carbolic acid, half a pint. The London Live Stock Journal thinks it will pay to sponge every beast in the house night and morning.

SHORT AND FRESH.

A WRITER in our esteemed contemporary, the Farmers' Review, says that listing corn is the lazy man's way of doing away with extra work in the Spring. But he thinks that the lazy man as in other cases "takes the most pains." The listed corn has not stood the drought half as well as planted corn.....

DR. BABCOCK of the N. Y. Ex. Station, we learn, has solved the question of detecting adulterations in milk and butter and imitation butters—a matter of the first importance certainly.....

ONLY a knowledge of bees, faithful attention to the apiary and a thorough and timely preparation for the honey flow, swarming and wintering, will make any man or woman a successful bee-keeper, says the Vermont Watchman.....

WERE we dreaming, asks the Western Plowman, or did a little bird whisper to us that a great organization was about to be formed called the Daughters of Purity, in which men are to be measured by the same standard that they apply to the character of women?.....

MAKE cuttings of currants and gooseberries *now*. Six inches long will answer. Mellow the soil, insert them vertically (straight up and down) or nearly so and press the soil about them *firmly*.....

SAVE the *best* specimens of tomatoes for seed, no matter whether they are the earliest or latest, so that they grow upon varieties suitably early for your soil and climate. We can not compete with the South as to earliness, and we should think more of solidity, smoothness, quality and productiveness .....

IF the farmer's help does not feel inclined to pay for and read a good paper with some trustworthy agricultural information in it, it will pay the employer to spend the money for it and present it to his workman, says the N. Y. Times.....

THE Merino, says J. S. Woodward in the N. Y. Tribune, is a noble sheep, the pride of the American breeder, but there is no reason why he cannot be greatly improved. Why not breed for fewer wrinkles, less grease and more wool?.....

DR. KEDZIE says that all cisterns should have an outlet pipe as well as an inlet, and of the two the outlet is the more important. And the escape pipe should extend to within half an inch of the lowest part of the cistern, and should not be more than two inches in diameter when the entrance pipe is four inches. So when the cistern becomes full during a heavy rain the water is pressed out with force enough to carry with it all the dirt and sediment that will settle in the lowest place, along with all the old impure water. Put the outlet and inlet well down below the frost. Make the neck long enough so the frost cannot enter. Above all, make the cistern as deep as possible. Avoid filters; and you will have a cistern of satisfaction to you and to coming generations. The cistern preferably should be made egg-shaped.....

THE Indiana Ag. Coll. (Lafayette, Ind.) raised 49 different kinds of wheat the past season. Velvet Chaff ranks first both as to hardiness and yield. It is described as a bearded wheat. The Velvet Chaff raised at the Rural Grounds is beardless. Oh, for a correct nomenclature! The Michigan Amber also ranks high. W. C. Latta says that the only wheat which the College has for sale that he can confidently recommend is the Velvet Chaff.....

C. D. WARNER says that a dead bird does not help the appearance of an ugly woman, and a pretty woman needs no such adornment.....

THE N. E. Homestead advises farmers and fruit growers to secure barrels early, while the demand is less than the supply.....

A PROMINENT Short-horn breeder in one of our Northern States recently said to a correspondent of the Breeder's Gazette that he would "give $5,000 if his Short-horns were without horns." The New England Farmer says that a Hereford breeder, whose name stands high in the Hereford fraternity, told the same writer that he would remove the horns from every one of his heifers if he did not know it would hurt their sale. The steer of the future and the domestic cow of the future will be without horns.....

WE are firm believers in cutting corn as soon as most of the grain is glazed, though the rule does not so well apply to the dent corn.....

SAVE the corn fodder before it is harmed by frost. Mr. Stewart well says if it is cut before frost, it is green and full of nutritious starch and sugar. Frost tends to change these to woody fiber. This part of the corn crop is often equal in value to the grain.. ..

SOUTHERN farmers believe the cow pea to be the best milk-and-cream-making fodder grown, and from the known nutritious character of this plant the claim is no doubt just. We have raised immense crops of this pea at the Rural Farm. Care, however, must be taken as to varieties selected.....

POMEROY'S DEMOCRAT says that every time a person tells the truth he adds to his strength of character; every time he oppresses a servant he is guilty of a sin; every time he pays rent he is taking that much away from a home

of his own; every time he refrains from speaking in defense of a friend he proves that he is *not* a friend.....

EASY MATHEMATICS.—The Vindicator proposes this problem: If a farmer pays $250 for a twine-binder in the Spring, and cuts $160 worth of wheat in the Summer with it, how long will the binder have to stand out in the weather to get a mortgage on the farm!.....

A SHORT-HORN cow belonging to David Niles, of Pickaway County, O., gave birth to a well-developed calf, a few days since, which weighed just eight pounds. So says the Live Stock Indicator.....

ACCORDING to the past year's experiments with wheats at the Ohio Agricultural Experiment Station, two pecks of seed to the acre gave a yield of 42 bushels; three pecks, 43; four pecks, 42; five pecks, 42; six pecks, 38; seven pecks, 37; eight pecks, 28. A second sowing of four pecks gave 36.....

As to dates of sowing, four pecks being the quantity sown, August 29 gave 41 bushels per acre; September 10, 32; September 17, 35; September 24, 39; October 1, 42; October 8, 36; October 15, 38; October 22, 30. Plots two and and three were not so well prepared as the other plots, owing to wet weather.....

IT is now nearly two years since we called notice to the growing attention paid to matters agricultural by the American magazines, as manifested by the number of articles most of them contain during the year relating to farmers' affairs, especially live stock. The London Live Stock Journal notices a similar tendency in English journalism; but it is in the great dailies rather than in the magazines. While most of the prominent daily papers in this country publish weekly editions with one or more columns devoted to agricultural topics, the English dailies have not yet followed the example. Their only notice of farming matters has until lately been in the shape of news; but recently the Times has been discussing Hampshire sheep; the St. James Gazette has devoted nearly a page to Hereford cattle, while the Pall Mall Gazette, not to be outdone by its younger rival, has had a long article on Mountain Sheep!

PRINCIPAL WALLEY, of Edinburg, considers salt and sugar good helps in feeding young stock if supplied in proper measure; but an over-dose of the former acts as an irritant, and of the latter as a purge.....

THE Professor is sure there is no hereditary tendency in contagious pleuro-pneumonia....

Ergot on grass is unusually plentiful this year in England, and farmers are warned against it as a prolific cause of abortion in stock.....

WAS Abraham Lincoln a crank when he made this declaration; "I affirm it as my settled conviction that class laws placing capital above labor in the structure of the Government endanger the Republic more fatally this hour than did chattel slavery in the days of its haughtiest supremacy,".....

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

BLOODY MILK; HORSE RUBBING TAIL AND MANE.

J. W., Franklin, N. J.—1. What is the cause of bloody-milk? 2. Why does a horse scratch his tail and mane, and what can be done for him?

ANSWERED BY F. W. KILBORN.

1. The causes of bloody-milk are very variable. The most common cause is some local injury, as from kicks, bruises from stones thrown by careless attendants, walking through underbrush or over a low fence, or lying on a hard or pointed body. The injury may be so slight as to be unobserved except for the milk. Running or chasing by dogs; a too sudden change of diet, as from scant to rich, flush feed; also feeding upon certain acrid or resinous plants, as some of the ranunculi, polygonums, coniferæ and others which are said to cause bloody milk; occasionally during heat, especially if ridden by their fellows. Any condition that causes congestion and inflammation of the udder, even if but slight, is liable to cause bloody milk. The course of treatment will depend somewhat on the cause of the difficulty. If possible, first ascertain and remove the cause where it still exists. In most cases a pound of Epsom salts, with two ounces of ginger, will be found beneficial to open the bowels and relieve blood pressure; to be repeated after 24 hours if no movement of the bowels is produced by the first dose. This may be followed by one-ounce doses of nitre, night and morning. During treatment the diet should be restricted and consist largely of green food, roots and mashes. If there is any slight local injury, swelling or inflammation of the udder, bathe for twenty minutes after each milking with cold water and rub vigorously. If feeding heavily or on very flush pasture, feed more sparingly until the difficulty has passed, then increase the feed gradually. In the absence of any apparent cause look over the pastures for plants that would be liable to produce the trouble. If pasturing on wood lots or swampy ground, remove to a pasture that is occasionally under cultivation. 2. If the rubbing is confined to the mane and tail it is probably due to some animal parasite, either lice or a form of mange. Closely examine the skin about the roots of the hair, on at least three or four occasions both by daylight and lamplight, for lice. If no lice are found, look for scabs, crusts or roughness of the skin. Remove any crusts found, break them up finely over a large sheet of writing paper, and watch carefully, preferably with a low magnifying glass, for slight movement of minute particles or specks. Any such found will be mange, scab or itch parasites. If crusts or scabs are found, soak and remove by washing thoroughly with strong soft soap suds, then apply an ointment of one part of oil of tar, and 20 parts of sweet oil, or a sulphur ointment, rubbing the ointment well into the roots of the hair. If no crusts are found, apply a solution of water saturated with kerosene or a strong solution of tobacco—one pound of tobacco boiled in 10 quarts of water. Whitewash the stall or stable, adding a half pint of kerosene to each bucket of whitewash.

FAILURE OF AN APPLE ORCHARD.

E. T. J., Newport News, Va.—My apple orchard is 14 years old, and has been cultivated ever since set out. It is on the south side of a 26-year-old pine wood, from which it is separated by a road. Soon after the leaves appear in several rows near the wood they turn yellow and several spots are seen on the upper, and a fine yellow dust on the under side. In a few weeks they drop off and are replaced by new leaves which seem healthy for the rest of the year. In other parts of the orchard a tree is now and then similarly affected. Such trees never bear any fruit, and the others yield only a few, and those knotty and wormy. In 1878 I gathered 45 barrels of the nicest and smoothest apples I ever saw, and in August, the same year, every tree in the orchard was blown down by a heavy gale. They were set up again, but since then I have never had a smooth, nice apple. Can anything be done to make the orchard fruitful, and the fruit handsome?

ANSWERED BY W. L. DEVEREAUX.

The spots on the leaf and yellow dust underneath at the first leafing out in Spring, together with the abundance of knotty, gnarly apples, point to that common pest of the apple, the fungus growth named Fusicladium dendriticum, an account of which appeared in the RURAL August 1, 1885. Our friend's orchard is attacked very severely, but orchards in every direction are injured very extensively in foliage by it this year, and it seems to be annually increasing. Trees put on a healthy growth of leaves after the attack, but on many all the foliage isn't clean and the new tip shoots decked in light-green leaves present the appearance of colored flags fixed to a tree with dusty, worn foliage. The failure of the apple crop this season in the North, is largely due, I assert, to this parasite. Orchards near Lake Ontario and other bodies of water, have a favorable influence protecting them from this pest. Trees leafing and blooming late escaped, just as the late-leafing peaches escape the "curl-leaf" fungus. Old trees or those which have received even less injury than the above orchard, are much subject to this "mildew." Incomplete plant food in the soil, and in the present case, the unfavorable influence of a pine forest adjoining, certainly assist the development of the parasite. It is very possible that a thorough treatment with wood ashes, muriate of potash, a heavy mulch of sea weed, or even straw, might reclaim the orchard. Mr. Malcom Little, of Malcom, New York, has succeeded in curing the "yellows" of the peach with alkaline mulches, and he thinks these applications are needed in the apple orchard.

A CONGRESSIONAL BLACK-LIST.

Several Inquirers have asked for the names of the members of the House of Representatives who voted against the Oleomargarine Bill, and who should therefore be blacklisted by the dairymen of the country. Here they are; 16 Republicans and 85 Democrats; 30 from the Northern and 71 from the Southern States. Republicans in *italics*:

ABOUT STRAWBERRIES.

A. B. (no address).—What varieties of strawberries are best for a light loamy soil? 2. What is the character of the Ontario strawberry? 3. In the absence of stable manure, what is the best fertilizer for strawberries on an exhausted loamy soil? 4. How would the Jewell do under matted-row culture on such land?

ANS. 1. Charles Downing, Sharpless, Cumberland, Crescent, Iron-clad and Parry. 2. Favorable from one season's fruiting. Another season will be required to express any positive opinion. 3. We should sow broadcast late in the Fall, 800 pounds of raw bone flour and 200 pounds of sulphate of potash. In the Spring as soon as the frost leaves the ground, 100 pounds of nitrate of soda and 100 pounds of blood. Harrow and plant. 4. It would do well no doubt, but all strawberries must have food and plenty of it to give profitable crops.

GRAINS ON TASSEL AND COB OF CORN.

C. B. P., Albany, Ill.—A contemporary of the RURAL says: "The grains of corn that grow on the end of the stalk with the tassel, will produce new varieties if planted by themselves. It is in this way that many curious and sometimes valuable novelties are secured." What does the RURAL say of that?

ANS.—There is nothing whatever in it. The seeds or grains produced on the tassels are essentially the same as the kernels produced on the cob. It occasionally happens that the tassels bear female flowers or those which produce silk (or pistils). The sexual influence is precisely the same so far as is known.

Miscellaneous.

J. S. B. (no address).—When my two-year-old colt was foaled, he had soft bunches as large as the "bottom of a teacup," on the inside of his legs just below the knees; they are somewhat larger now. What should be done for him?

ANS.—The bunches are evidently congenital. Why they should have occurred we cannot say: and without knowing the exact location and nature of the swellings we cannot prescribe definitely. If, as we suspect, they are near the knee, so that they may be connected with the joint, it would be unwise for any one not well acquainted with the parts to disturb them. Consult a veterinary surgeon if possible.

F. P., Eganville, Ont., Canada.—The inclosed heads of wheat are the result of the reseeding last Fall making it a fall wheat. Is it a common occurence? Is it a new specimen of fall wheat? Will it grow if sowed again this Fall?

ANS.—This wheat resembles Lost Nation, a spring variety. About eight years ago we began the experiment of changing this (with other spring wheats) into winter wheats. For two years the Lost Nation passed the Winters safely, the third every plant was killed.

L. D. A., Cortland Co., N. Y.—Of the plants sent for name: 1. The gooseberry is one of the foreign varieties which are numbered by hundreds. We cannot name it. 2. Seems to be a poor specimen of Holcus lanatus—Soft or Velvet Grass. Of no value. 3. Trifolium agrarium—Yellow Hop Clover. Of very little value. 4. Pyrethrum Partheninm—Feverfew.

L. L., Gallatin, Dak.—The vine is a parasite, Cuscuta inflexa—Dodder. It germinates in the soil, but soon withering at the root, derives its entire nourishment from the plants it twines around.

J. M. S., Penn Yan, N. Y.—The plant sent for name is Medicago sativa—Alfalfa. A very valuable forage plant, particularly for the Southern States.

S. C. S., Westova, Md.—Are not the Netted Gem Cantaloupe and the Golden Jenny identical?

ANS.—We do not know.

J. M., Sarnea, Can.—All nurserymen have the Japan Snowball, or Plicate-leaved Viburnum for sale.

DISCUSSION.

J. D. O. B.—In a late RURAL, a correspondent asks whether linseed oil will be of service to old wheels that are getting loose. In the Spring of 1885 I had two wheels on a Spring wagon repaired, new spokes were put in and half a rim in each, and the tires were cut. The first time the wagon was used in warm weather the spokes became loose in the hub, and the tires were loose also. The man who had done the repairs was consulted, and claimed that the hubs were rotton and that the fault was not in his work. The wheels had to be soaked in water to make a short trip. I concluded then that I would try the effect of linseed oil. I painted the wheels well with the oil, rubbing it well into the hubs. I found that the oil swelled out the hubs just as the water did, and that it filled the pores well and made the wheel tight. The wagon was run regularly through 1885, and has been used as a market wagon during 1886, and the tires have never been loose since, and the wheels remain stroug. Before the application of the oil, the wheels were almost ready to fall to pieces, and cutting the tires had failed to remedy the trouble. I think the oil swelled the hubs and then filled the pores. This experiment shows the efficacy of oil in old wheels. Boiled oil is said to be better, but in this case unboiled oil was used. It is believed that many old wheels would be made stronger by the application of several good coats of oil than by having the tires cut. If the tires are cut and not well painted, water swells the wheels, crushes the porous cell-work and the wheels are again loosened. If the pores are filled by the oil, the wheel is tightened and the water is excluded.

A. RICE, Mitchellville, N. Y.—This year I raised from the seed sent out by the RURAL 110 bushels of beautiful white Surprise Wheat, which I now offer for sale at $2 per bushel. It has proved with me to be a very hardy, productive variety, and I have found as it stools so greatly that one bushel of seed is sufficient for the acre.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, SEPTEMBER 18, 1886.

IT is desirable that the RURAL NEW-YORKER should be represented at all the agricultural fairs of the country. Those who are willing to act as agents will be furnished upon application with posters and all the specimen copies they may need.

SEVERAL flowers in a spike of the Gladiolus multiflorus at the Rural Grounds bore 30 petals and 15 stamens each. It is noteworthy because when flowers become double it is at the expense of the stamens or pistils or both.

A NEIGHBOR remarked to the writer one day last week that he had rather sell his potatoes now at $1.75 per barrel than to keep them until February and sell at $2.25. Many potatoes, which are now of marketable size, will have to be thrown out then. Besides, we have to consider rot and the shrinkage of the rest.

THE RURAL NEW-YORKER, as announced last week, will be mailed from now until January 1st, 1888—nearly 16 months—for $2, or, in clubs of five or over, for $1.50. Specimen copies and posters will be sent promptly to all who apply. Our new Premium-list of 16 pages will again and at any time be sent to all who desire it.

THE writer was asking himself a few days ago, as he sat under the Yellow-wood of the Rural Grounds, and admired first one, then another of the many different kinds of evergreens in view, which he would choose in case he was confined to one or two. We thought it over very carefully, and chose, first, the common Hemlock Spruce, and, second, the White Pine, and this, too, after cultivating for 13 years the rarest conifers known. Few know of the surpassing beauty of the White Pine when, during youth, it has been disbudded, or cut back in a way to induce an ample furniture of foliage from the ground to the top.

We hope to retain for years to come as in years past, the bulk of our old subscribers without any further inducement than that which the RURAL NEW-YORKER *itself offers. If they continue to need and to prize it, they will continue to subscribe for it. In order to induce those who would gladly see its circulation largely increased to aid us in this work, we have placed before them two propositions. The first is that in clubs of five or over, the price will be (until further notice)* $1.50 *per year. The second is embodied in the premium-list, a careful examination of which will certainly show that adequate compensation is offered for any effort our friends may kindly make in the* RURAL'S *behalf. Send for it if you have not received it.*

MIKADO AND TURNER'S HYBRID.

TURNER'S Hybrid and the Mikado Tomatoes are receiving as much praise in some of our farm journals as if they were distinct varieties. But they are distinctly the same, as the RURAL has before stated, and as we suspected as soon as the first true leaves appeared upon the little plants last Spring. The foliage is quite different from that of any other kind of tomato known to us, quite resembling that of young Lima beans in a general way. This peculiarity of foliage is all that we can find about this tomato to interest us. The variety is a strong grower and very productive. So also are Optimus, Beauty, Perfection, Acme, Cardinal, Paragon, Mayflower and a score of others. The fruit of the Mikado, or Turner's Hybrid is as firm and well-flavored as that of any of the above. But the variety is inferior to them in one essential respect—*shape*. There are scarcely two shaped alike. Most of them are as deeply lobed and irregular, as the Trophy; many of them more so. Occasionally one is found that is smooth and handsome, and from such, by continued selection for several years, a tomato may be evolved that, besides a peculiar foliage, may prove as good in every other way as the popular kinds now before the public. The origin of this new tomato seems to be obscure.

A SOURCE OF DISEASE.

THE statement is made that a barrel of kerosene buried in the ground will give a distinct taste to all water taken from a well within 20 rods of it. The foul vaults to be found on the majority of farms are far more deadly than kerosene, and the injurious emanations from the contents are certain to pass into wells whenever allowed to do so. The cold well-water, which we are apt to look upon as the purest of all drink, is often fairly reeking with disease germs washed into it from the filthy, uncleaned vault. The worst of it is that these germs are often imperceptible to the taste or smell. Their presence is never known until some member of the family is stricken with disease. At this hot, dry season there is particular danger. The ordinary farm vault is a veritable plague spot, responsible for the loss of numberless dear lives that might have been spared by a decent regard for sanitary laws. The man who allows an open, uncemented vault to remain upon his premises is guilty of a criminal offence. The vault should always be watertight, and dry earth, road dust or other absorbents should be used freely. The best closet that can be used consists of small iron or wooden boxes, in which absorbents are very freely employed. They can be taken out and emptied at frequent intervals. This method will make extra work, but the increased cleanliness and health resulting from it will pay.

KILL THE WEEDS.

IN too many neighborhoods farmers have prepared a bountiful crop of weeds for next year's seeding. Along the roads, in old strawberry patches and potato fields, in the waste places, back of the houses, there are millions of weed seeds ripening at leisure. Weeds are a curse. We are tired of the charity which spoke of them as "plants whose virtues have not been discovered." They are the worst of all enemies of legitimate plant life, for they add robbery to murder. If farmers would only combine against these tramp weeds, which crowd into roadsides and other waste places, thus escaping the cultivation which is bestowed upon the profitable parts of the farm, with the determination with which they combined against oleomargarine, they could make solid progress. The fact that the weeds grow and flourish upon land that could not be profitably employed in agriculture, leads many farmers to consider them comparatively harmless. This is a fatal mistake. So long as a single weed ripens its seed within 20 rods of a cultivated field that field is in danger. And even after every growing weed has been exterminated there is danger. It has been shown that weed seeds can lie dormant in the soil for years, to germinate at last when least expected. The interest awakened in tree planting by the general observance of Arbor Day has done much to counteract the careless spirit which prompts the destruction of forests. Shall we not be forced in the near future to appoint "Weed Days." The idea is a sensible one. By devoting one day to the business of cutting and burning the weeds that grow in roads and waste places, farmers could save themselves an immense amount of work and trouble. Let Granges and Farmers' Clubs take hold of the matter and make "Weed Day" an established fact.

A LESSON IN ROAD-MAKING.

WE know of one Southern town that has taken a practical lesson in road-making. It is situated on a "prairie," where during the rainy season the mud stands a foot deep. During the Winter the streets are simply impassable by reason of the mud, and when this mud dries it dries in great mounds and ruts that will shake a wagon into pieces. There was no gravel within thirty miles. It was at first proposed to build a plank foundation through the main street, but this was considered too expensive. There was but little intercourse with the surrounding country, except on horseback, from November to April, One dealer sold a wagon and could not deliver it for four months simply because he could not haul it out of the town. The town is quite a shipping point for cotton. Two railroads run through the place, and there is close competition for the cotton shipments. One railroad offered to deliver free of cost a number of carloads of gravel on condition that it be applied by the town authorities to the street leading to the depot. The other railroad, not to be considered behind the times, duplicated this offer, and the town accepted. As a result, nearly one mile of street was fairly well-coated with gravel. The effect was so plainly noticeable that the town has decided to improve all the roads within the corporation limits. It is so unmistakably evident that good roads will increase the business of the place and add to the comfort of the people that those who before opposed the expenditure of money for road repairing are now in favor of it. There are thousands of neighborhoods that go on thinking that money spent on good road-making is money thrown away. If they could have practical demonstration of what good roads are, they would never regret the money spent in securing them.

LAND HUNGER IN IRELAND.

PROBABLY in no other country in the world is land hunger or love of the soil so great as in Ireland. For ages the land has afforded only the meagerest support to those who have tilled it, yet the peasant is always ready to suffer all sorts of privations, to the verge of starvation, sooner than abandon the little holding that has kept his forefathers, himself and his children pinched and tattered, and his highest ambition is to be the absolute owner of a few acres. To secure this object he will improvidently undertake obligations which it is almost impossible for him to discharge. Irish tenant farmers now insist that it is impossible for them to pay the rents which a few years ago the courts decided to be fair. They say the value of agricultural products has been constantly going down, and that present judicial rents are from 30 to 50 per cent too high. In spite of this, however, the cables a few days ago announced that the owners of several estates had sold the fee simple of their property to the occupying tenants for sums amounting to from 16 to 20 years' rental at the present exorbitant rate; and this, too, though the price of Irish land is going steadily down, owing to decreasing population and increasing foreign competition! The American tenant farmer who hires land at a fair rent, seldom estimates the price which he should pay for it at over nine to ten years' rental, although the land is certain to increase in value owing to the rapid increase of population. The Irish farmer pays the purchase money in yearly installments, and can borrow a part of it from the government; but it is preposterous to suppose that, under the circumstances, he will be able to pay it. Michael Davitt has repeatedly warned the tenantry that Irish land is worth only from five to ten years' rental, allowing the tenant full credit for all improvements made by him, and there is no doubt that in a few years the peasant proprietors will be importunate for a scaling down of the annual payments just as the purchasers of Irish glebe lands, who bought on the disestablishment of the Episcopal Church a few years ago, are clamoring for relief at the present time. In spite of the recent enormous depreciation of farming land in the United Kingdom, there is no doubt but the value put upon it at present is absolutely fictitious, and the landowners in all parts of the islands would do well to heed Gladstone's late warning to Irish landlords—"the sand in the glass is rapidly running out."

POOLS.

COMBINATIONS of the unscrupulous are always inimical to the welfare of the community. The manipulators of gigantic rings which aim at a monopoly of any trade are utterly unscrupulous in their means for accomplishing the objects they have in view. When they join hands it is always for the purpose of obtaining an undue and therefore an unfair advantage over legitimate trade and honest industry. However plausible the reasons assigned for such associations, their object is always to extort from an unwilling public a patronage and profit they can secure in no other way. Who knows of a single instance in which the welfare of the community has been promoted by any such combination?

No class suffer so much from organizations of this kind as farmers. There are manufacturers' and jobbers' pools, whose sole object is to put up the prices of most things farmers have to buy; there are buyers' and speculators' pools, whose sole object is to put down the prices of most things farmers have to sell; and there are railroad and steamship pools, whose sole object is to secure unduly high rates of freight on both manufactured and raw products on their way from the workshop to the farm, and from the farm to the market.

In other industrial callings combinations are constantly made to keep or raise up the price of labor or its products. Hitherto such combinations have been impracticable in agriculture. When employers of labor combine to lower wages, trades-unions combinations are ready to resist, and often even exact higher figures. When grain buyers combine to put or keep down the price of wheat or corn, the farmer, as a rule, has to abide by their decision, for generally he must sell to obtain money for pressing needs, and he cannot advantageously ship to distant markets, as the railroads will charge a higher rate of freight and the consignee a higher rate of commission on his single shipment than on the aggregate shipments of an individual buyer or combination of buyers, to say nothing of the greater risks of overcharges or total loss through an unscrupulous or dishonest consignee.

What is the remedy? Evidently either protective combinations against inimical organizations, or legislation to prevent them. Why shouldn't the farmers of each district keep posted on the markets and combine to sell or ship their products, and also to purchase their supplies? By this means they might sell the former at the highest figures, buy the latter at the lowest, and obtain fair rates of transportation on both. Generally this would be very difficult, if not impracticable, at present; but it is done to some extent in some places, mostly through the Grange, and there is a strong tendency to form combinations for the purpose everywhere. Preventive legislation is being tried to some extent in Minnesota, but such legislation can have no influence on injurious combinations outside the State, and can only check flagrant abuses within its limits. The great necessity now is that farmers should fully realize the removable evils which curtail their legitimate profits; for a clear recognition of these is a prerequisite to their suppression.

BREVITIES.

WHO can supply nuts of the Japan Chestnut to our subscribers?

THE Empire State Grape has made a fine growth at the R. G. this season.

ONE of the most grotesquely beautiful trees is the Weeping Beech, but it requires at least twelve years to show its grotesque beauty.

ANY of our readers who care to post up their visitors will kindly send for the new RURAL poster and post it up in a conspicuous place.

OUR advice is not to sow wheat early if the soil is dry. Better wait even a month for rain. The trouble is that the wheat will usually germinate and be injured irremediably if the drought continues.

THE Spanish have a good old proverb that will bear thinking over.

> "They who wait the coming rider
> Travel twice as far as he,
> Tired wench and coming butter,
> Never could in time agree."

The tendency of young men is to try and hurry results. They cannot wait for the slow, legitimate process through which all that is good must pass. A careful, patient development is the safest in the end. Young America needs to study patience rather than push.

THE Early Victor (black) ripens at the Rural Grounds almost exactly with Moore's Early. If there is any difference the Victor is a day or so earlier. The skin is firmer than Moore's Early, the quality fully as good, the berry and bunch smaller—the vine a less thrifty grower.

THE meeting of the American Horticultural Society, just closed at Cleveland, Ohio, has been a successful one. The attendance was good, the papers read were interesting and practical, and the discussions spirited. The display of fruits was excellent and the prizes were well scattered about the country. The society is doing an excellent work and its proceedings are well worthy the thoughtful consideration of all Americans. We hope to begin a report of the proceedings next week.

OLEOMARGARINE and its kin are the bitter foes of all dairymen; so are flies. Many a pound of butter and many a gallon of milk are sucked from the blood by wretched flies and gnats. Good farmers who will fight oleomargarine with every weapon they can handle, are often disgracefully beaten by these winged enemies. No merciful man wishes to torture his animals, and yet one can hardly subject them to worse torture than by compelling them to fight flies all through the hot sun. It is more humane and more economical to keep the cows tied up in a darkened stable, during the heat of the day at least. Good farmers would point in scorn at a man who would keep his cattle out in cold, freezing weather, yet how much more cruel is it than the usual summer treatment?

Indust'l Societies.

SOCIETY NOTES.

THE managers of the Dubois Agricultural Fair [Pa.] recognize the fact that there is not much money to be made at such an exhibition. The profit is to come in the awakening of a "spirit of progress," which will change the whole country for the better. This idea is correct. It is poor policy to run a fair simply for the purpose of making a few dollers. At the Dubois fair everybody is invited to come forward and help to make the meeting a success. Anarchists and dynamiters are excluded from this invitation. We should be better satisfied if rumsellers had been placed in the excluded class.

THERE is a growing tendency to offer better premiums for graded cattle at the agricultural fairs. This plan is a good one. Graded cattle must, for many years yet, make up the bulk of farm animals. Breeders of thoroughbreds will help themselves greatly by encouraging prizes to be given for the best specimens of grades of their own stock.

A CONVENTION of the Northern-born residents of North Carolina will be held at Raleigh during October. It is designed to show what part Northern persons are taking in the development of the South. No doubt advantage will be taken of this meeting to push the advantages which the State offers to immigrants to the front.

THE managers of the Indiana State fair have set apart Sept. 28 for Children's Day. All children under 12 years old will be admitted free, and special arrangements will be made for their entertainment. The dog and pony shows will be of special interest to the little people. This idea is a good one and might well be followed by other societies.

SOME of the county agricultural associations have continued the old plan of adding reading matter to the usual list of awards in the premium list. We find some of them partly filled with essays and communications from farmers. The practice is not a bad one if the matter can be well selected. These premium lists are well read and studied. Where there is a live farmers' club in connection with the fair association, it might be wise to have a portion of the pamphlet given up to selections from the best essays read during the season. It is a fact that some of the most practical and reliable agricultural information comes from these farmers' clubs. The premium list made into the form of a report could be made very interesting.

AT the recent meeting of the American Seed Trade Association held at Niagara Falls, delegates were present from Massachusetts, Connecticut, New York, Pennsylvania, Ohio, Illinois, and the Province of Ontario. Resolutions of sympathy with the family of the late secretary, J. Y. Murkland, were adopted and spread upon the minutes. The postage and tariff questions were discussed at length. The committee appointed last year to wait upon the Secretary of the Treasury, and present the views of the Association in regard to the want of uniformity in the collection of duties, made its report. The question of valuation was also discussed. It was shown that too much latitude was allowed the collector. The law seems clear enough, but some of the collectors base their assessments upon what they deem the correct value, in some cases going back to a time six months before the crop was grown. Some seed growers had been compelled to go to other ports at great inconvenience and additional expense in order to get fair play. The only equitable mode of adjustment was that present market price only should be considered at the ports of entry. A motion prevailed authorizing the president of the Association to appoint committees, as special cases arise, to whom tariff matters might be referred with power to act. A very clear and elaborate paper was presented from the seed trade of Boston, showing what this Association is doing in the interests of its members, and on motion it was ordered that the substance of the matter presented be embodied in the annual report of the Association. Agricultural newspapers which accept the money of seedsmen for advertising, and also devote their space and use their influence to divert business from the seedsmen, through the tempting offers made by the papers themselves, came in for a share of the discussion. The convention will meet in Philadelphia in June, 1887.

AT the Wisconsin State Fair held at Milwaukee, Sept. 20–24, premiums of $50 each are offered for the best milk, butter and cheese cow respectively. Any breeds may be entered, but no cow can compete for more than one of the premiums. All food given during the test and for 12 hours before will be carefully weighed. The cows will be milked twice daily for two consecutive days, and the milk weighed. The chemical composition of the milk will be determined by chemical analysis. The scale of points to decide the contest will be as follows:

FOR MILK:—1 point for every 10 days since calving; 1 point for every ounce of total solid matter produced in 24 hours.

FOR BUTTER:—1 point for every 10 days since calving; 3 points for every ounce of fat produced in 24 hours.

FOR CHEESE:—1 point for every 10 days since calving; 3 points for every ounce of protein produced in 24 hours; if the amount of fat produced is less than one-and-one-seventh times the protein, deduct 3 points for every ounce deficiency.

Such a contest ought to call out good specimens of all the noted dairy breeds.

THE CARMAN BLACK-CAP RASPBERRY. First Season's Fruit. From Spring-set Plants. From Nature. Fig. 361.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

CINCINNATI CORRUGATING CO.—Catalogue of this reliable concern.—A well printed and finely illustrated pamphlet. One is surprised to note the immense number of uses in which corrugated iron can be profitably employed. Its use is rapidly increasing, and we are confident that it will become exceedingly popular when farmers take time to carefully examine the superiority over other building materials claimed for it. The pamphlet is well worth reading. The Cincinnati Co. have ample facilities and experience. They can supply anything in their line promptly no matter what the size of the order may be. Our readers may rest assured that they will receive the best of attention at the hands of this company.

ECONOMIC RELATIONS OF BIRDS AND MAMMALS.—The Department of Agriculture has recently established a Division of Economic Ornithology. Dr. C. Hart Merriam, Government Ornithologist, has sent out a series of circulars which promise to lead to valuable results in determining the legitimate place on the farm of many of our common birds and small animals. The circulars are entitled, "The English Sparrow," "Instructions for the Collections of Stomachs," "The Economic Relations of Mammals," "The Food-habits of Birds," and a circular to rice growers. Each circular contains a number of well selected questions relating to the habits and destructiveness of birds and animals. The design is to collect thousands of answers to these questions, from all parts of the country, and embody these answers in a general report. This work is one in which all farmers can be of great service. It is well known that certain birds destroy thousands of dollars' worth of farm crops every year, while it is equally well understood that other birds by preying upon mice and other injurious insects, preserve as much as the others destroy. Again, there are other birds which are looked upon as thieves and rogues, while in reality they do far more good than harm. Crows, owls and hawks have both friends and enemies among men. They steal corn and kill chickens, but they also destroy countless insects and mice. The evil results that always follow the wholesale slaughter of small birds, teach us that we must discriminate sharply between our friends and enemies. These questions, proposed by Dr. Merriam, intelligently answered, will go far towards balancing the good and evil qualities of our many feathered visitors. We need more light, and the farmers of the country should combine upon this question as upon any other. There are many small animals like rats, mice and foxes, that need no investigation. They are enemies beyond all doubt. There are others, like moles and skunks, that render valuable service to the farmer. How far does this good service go toward counteracting the damage done to lawns by moles, or to lessen the dreadful odor of the skunk? Questions like these are well worthy of atten-

tion. Our readers can do themselves and the public a real good by sending for the questions and answering them honestly. We hope they will take an interest in the matter, and help to make the report comprehensive and valuable. Send to Dr. C. Hart Merriam, U. S. Department of Agriculture, Washington, D. C.

CORNISH ORGANS.—Circular from Cornish & Co., Washington, N. J. The instruments described in this circular are low in price, and yet appear to be well made and durable. The prices for musical instruments have been greatly reduced of late and such establishments as this of Cornish & Co., have done much to bring about the reduction. The influence of music is ennobling and refining, and he who labors to place the means of producing it more extensively among the masses, is in a sense a public benefactor. Washington N. J., is noted all over the world as a manufacturing place for organs. The old idea that a large manufacturing establishment to be a success, must be located in a great city, has been disproved. Many highly successful concerns have pushed out of the city into some smaller towns of easy access where the cost of rents, taxes and labor can be reduced to a minimum. The establishment of Cornish & Co., is an immense affair. The firm proposes to reduce the price of good organs to the lowest possible point, by dealing directly with purchasers, and thus avoiding all commissions to agents and middlemen. Those wanting organs should send for the catalogue.

ENTOMOLOGY.—Report of the Government Entomologist for 1885.—A pamphlet of 150 pages, with numerous plates, giving an account of the work done by the entomological section of the Department of Agriculture. A considerable portion of the report is devoted to silk culture. We learn that 300 ounces of eggs were imported from France in 1884, and distributed in 1885 among some 850 applicants. Most of the applications came from Illinois. Most of the eggs were distributed in lots of one-twentieth and one-tenth of an ounce. Some 600 ounces were distributed this year. Some 8000 mulberry trees were distributed to serve as food for the worms. Nurserymen urge the Department to encourage the setting out of large mulberry plantations, as necessary in fostering silk culture; but for good reasons the distribution of mulberry trees has not been pushed. Attention is called to the Osage Orange as a food plant. In Central Illinois, where this shrub is used as a hedge plant, it is now the common material used as food for silk-worms. We do not see that the advocates of silk culture can glean much encouragement from this report. The business has been extensively advertised as suitable to old persons, invalids and children. The Entomologist distinctly states that such advertisement is calculated to do harm. There may be no heavy physical labor needed, but a most careful watchfulness is necessary, and a constant care involved which the farmer's wife with her multitude of household duties or the person with enfeebled constitution, cannot bestow. At the Experimental Stations silk has been produced at a cost, per pound, including raw material and labor, of $7.58, at Philadelphia, and $5.90 at New Orleans. This silk sold at $4.40 per pound. The remainder of the report is devoted to an account of experiments with various injurious insects. The habits, history and description of such insects are given, with best methods of fighting them.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

OMENS.

THE cornsilk tassels on the ridge
  Are bronzing in the sun;
The elderberries by the bridge,
  And all along the run,

Grow purple through the golden days;
  Barberries by the wall
Glow crimson in the silver haze
  That ushers in the Fall.

Old Ocean dreams in slumbers deep
  Of wintry storms to come;
In far-off mountain caverns sleep
  The winds; the brooks are dumb.

The partridge, in lone country lanes,
  Whirs low a speckled wing;
Silence through all the woodland reigns,
  The birds forget to sing.

From yellow cornfields slowly pass
  The crows, with clanging cry;
All day upon the orchard grass
  Ripe apples fall. A sigh

Escapes the earth at thought of death,
  For summer's life so brief,
And, fluttering on that sigh's faint breath,
  Falls down the first red leaf!

—Annie M. Libby in Good Housekeeping.

OF INTEREST TO WOMEN.

AMONG modern occupations for women, the Pall Mall Gazette reckons the profession of druggist. There is quite a community of feminine druggists in England, and it offers a better field for educated women than dentistry.

The English papers are still denouncing the slaughter of birds for adornment. Says the Echo: "In reckoning the factors of modern evolution, the future Darwin will have to take account of Fashion, which in some countries must be more potent than natural selection or the survival of the fittest. It is the women of Europe and America who are, doubtless unwittingly, working a change in the bird life of the tropical countries, by the demand they create for bird skins; and possibly, when the facts are brought to their notice, they will at once stop the present rate of slaughter by returning again to artificial flowers and feathers as suitable trimmings for their head-gear. The large number of bird skins sold in the merchants' auction rooms of London give no indication of the actual number of birds destroyed, for at a moderate computation every skin that is salable represents at least six birds, so many of the skins being irretrievably ruined by the methods employed to capture the birds. Of humming birds, Impeyan pheasants, birds of paradise, and other tropical beauties, some million skins are annually sold in London alone, to which must be added a large number of skins of tern and gull. Some spots on the Atlantic Coast of North America have been almost denuded of birds with snowy plumage, and if the present rate of slaughter continues, even the Brazilian forests will be depopulated, for any bird with handsome plumage is the prey of the hunter. No one has ever yet discovered the leaders of fashion, so an appeal is made generally to the women of Europe and America to discourage this wholesale slaughter of birds by refusing to wear any ornament which involves the death of the creature producing it, and it is to be hoped that the appeal will not be made in vain."

A contemporary says "the newest and latest jewelry craze is a curious little *porte bonheur*, said to be more efficacious in commanding fortune than even the horseshoe of the fathers. It is said to have originated in Egypt in the years when the pyramids were young, and bears the original name of Oudja, which signifies happiness tempered with good luck. It is in the form of a thin, flat, oblong of metal intaglio, and bearing the eye of the Sun-god Horus, from which a tear-drop falls, intended to represent the mysterious origin of the river Nile. The Pharaohs regarded it as a talisman, capable of warding off adversity as well as of promoting prosperity, and it is found sculptured on the rocks, cut on pillars, and engraved on mummy cases. In London this new charm is becoming quite the rage, ordinary furor being stimulated by the curious history said to have attended its introduction into England and modern civilization. The fair young wife of a gallant officer in the Guards received one from her husband fighting in the Soudan with the legend: 'This is the charm which protected the cultivators of ancient Egypt against misfortune: may it act likewise in your favor and insure brilliant days for your future.' A report came soon after that the guardsman had fallen a victim to duty and honor. But the young wife had conceived a superior faith in her Oudja and refused to believe, despite published official news of his death. An extraordinary escape and unexpected return of the officer has been accredited to the protecting influence of the Egyptian talisman, and in fashionable circles the Oudja is speadily becoming all the wear."

OUR SINGLE BLESSINGS.

A CLEVER botanist once proved, with remarkable distinctness, that the clover crop of this great country depends entirely on the number and distribution of our crop of spinsters. Clover, be it known, must be fertilized by bees. Now the great enemy of the bee is the common field mouse, and as the mischievous rodent is only suppressed by the domestic cat, the existence of the bee, and consequent fertility of the clover, depends on this useful animal. Old maids are proverbially given to the culture of cats; the clover crop is dependent therefore on these self sacrificing members of society.—Q. E. D.

But the spinster's usefulness does not stop at the production of clover. Don't we all know some helpful, benevolent spinster, some radiant Aunt Jane or Hester, who eschews "cuts, scandal and Bohea?" Thrice blessed is the family to which she belongs. To her the children take their wounded fingers and wounded feelings alike; she is always mistress of the revels, and at Christmastide is in great request as confidential adviser among young and old. She is equally an authority on catnip tea and cats-cradles, and will give judicial advice on the set of a kite's tail or a doll's frock with equal readiness. To the elder members of the family she is an ever sympathetic friend, nor does she confine her efforts to her own people. She is a good Samaritan to the dweller of highways and hedges, according to the advice of the scholarly Apostle. Such a woman—and she is by no means rare—gives lustre to her much-maligned class. But why should we hear so much of the crabbedness and general ugliness of old maids? It is our deeply-rooted conviction that they are much more useful, amiable, and self-sacrificing than old bachelors. So there!

The average man holds, as soundest doctrine the opinion that every woman would marry if she had the ghost of a chance. This is doubtless true in many cases, but it is not by any means an invariable rule. Many a faded spinster bears deep in her faithful breast the memory of some early love, lost, but unforgotten; many a one has toiled and crucified self for home and kindred, to meet with little reward save the sense of duty done, and the title of "old maid."

We must admit that we occasionally meet with very unfavorable representatives of the class. Prying, inquisitive, gossippy, unattractive in dress and manner. They offer a convenient text to support the popular impression of spinsters. But don't we all know married women who display all these objectionable traits? It is the native disposition, not the result of her condition. When a woman appears soured by single life, it displays a radical defect in her education. Every woman should be trained to be a good wife, but she should be trained to make a successful spinster also. Then she is prepared for either fate. Marriage is an holy and honorable estate, but we can't all marry—the census says there are not enough men to go round—and believing that old maids are a blessing to every community, let us bear in mind the advice of a sage equally remarkable for wisdom and bad spelling: "It is better to be laffed at becoz yew are not married than to be unable to laff yourself becoz yew are."

TAKE CARE.

MRS. S. H. ROWELL.

"I have been all night over with Ella Norton, helping her take care of her children! I wish to goodness there was a law to prevent people who do not know enough to take care of their children ever getting married!" exclaimed Jenny Saunders, as she rushed unceremoniously into her sister's house, one hot morning in August, threw off her hat and drew a chair up to the breakfast table.

"Give me a cup of coffee, please Hattie, I am tired out, sleepy and cross," she said laughing, and kissing a little bright-eyed youngster who sat in his high chair eating a bowl of bread and milk. "Auntie is glad that Robbie's mamma knows how to take care of him."

"What is the matter with the Norton's, Jennie? You have not even given the top of the morning to us," said George Elliott, as he passed the plate of hot rolls to her.

"I am too much out of humor to be polite. I do not often forget my manners you know, but, good morning, Mr. Elliott. Well, last night, (you know mother had the headache yesterday) there came a tremendous ring of the door bell after eleven o'clock. I slipped on my dressing-gown and ran to the door and asked who was there. 'Mrs. Norton's little girl is dreadful sick, wants your mother to come over as quick as she can; I called at the doctor's and he is not at home,' said the boy, who lives at Mr. Norton's.

"'Mother is sick herself, she cannot go,' I answered."

"'Oh, dear! cannot you come, Miss Jennie?'

"Well, I thought I would go, so I dressed as quick as possible and went with him. The child was in terrible distress and seemed quite unconscious; his eyes were rolled up in his head, and he would cramp up his legs and scream. I was just frightened myself and his mother was as white as a sheet. Mr. Norton was lighting the fire.

"'What has he been eating,' I asked.

"'I guess he ate too much ice cream and cake,' she replied.

"'We must give him an emetic then,' so I flew around but not a thing had they in the house that would answer the purpose till I thought of mustard, I stirred up a teaspoonful as quick as I could in some warm water which we had to force down; his mother telling him it was good. Then I heated some flannels to put on his stomach. Just as we were giving him the last spoonful little Ella began to scream. Well, we did have a lively time. She was in as great agony as her brother, and cramped dreadfully. I dosed her with mustard and wrapped her in flannels, and told her she must keep as quiet as she could, for Johnny was dreadfully sick, then I asked her if she had been eating ice cream. She said they had it for supper, and afterwards she and Johnny asked mamma if they might have some more, and they took some spoons and went to the freezer and ate all they wanted. By and by Johnny commenced to throw up, and I fancy he will not want any more ice cream for a while. In half an hour more Ella had got rid of her supper, I kept changing the flannels, so as to have them hot all the time. The little boy went to sleep first, about three this morning; then their mother gave up and I reckon she had hysterics. Her husband got her on the bed and sent again for the doctor. When he came he said the mustard had saved the children's lives. That ice cream was seasoned with vanilla so strong that it was fairly sickening. Oh, dear! what fools there are in the world."

"What a blessing it is, Jennie, that there are a few old maids left to look after fools and their children. I, for one, am thankful that there is one left in our family," said Mr. Elliott, as he took his hat and turned toward the door.

"You insinuate that I am an old maid, George Elliott! Thank you. I know enough not to feed babies on ice cream, and I always keep medicines on hand for an emergency."

"Of course, you do. So does every one of your mother's girls—thanks to her for her wise teachings! If she had not been a wiser woman than Mrs. Norton's mother her girls would not have been more intelligent or thoughtful than Norton's wife. I think I shall tell Norton of the bill you are going to present to the Legislature. I will vote for it, any way," said he. "Hattie, why don't mothers take care of their children?"

"Just because they do not know how. Mrs. Norton has lost two little ones, and it does seem as if she would try and be more careful of their diet. One you know died in a fit, caused by eating currants and drinking milk afterwards, and the other one had the croup, and they did not call in help till it was too late" said Mrs. Elliott.

"She says that there has not been a week since her first baby was born, but what they have had a physician called. I should think she would learn, 'that an ounce of prevention is worth a pound of cure.' But I must go home, or Mother will think I am lost. Take care of Robbie; this hot weather, one cannot be too careful of the little ones, and try to keep them well."

WOMAN IN POLITICS.

M. W. WILKES.

"WOMEN know
The way to rear up children (to be just);
They know a simple, merry, tender knack
Of tying sashes, fitting baby shoes,
And stringing pretty words that make no sense,
And kissing full sense into empty words;
Which things are corals to cut life upon."

This tribute to women by Mrs. Browning would never be accorded to men. Yet here is Burns' tribute to the sterner sex:

"Princes and lords are but the breath of kings
An honest man's the noblest work of God."

Men and women have their respective fields of work. The creator knew what was best when, in the garden of Eden, he said to the man, "In the sweat of thy face shalt thou eat bread."

The heavier, coarser, manual work should be done by men. Women do it in some countries, but American women do not aspire to a coarse face and figure and brawny red arms. Coarse brain work is in the field of politics. There are flinty rocks and accumulated debris which men can hardly work through, and should women eventually enter the lists, they would become coarse, unlike the modest, refined, thoughtful, and more than all, deeply spiritual women every one loves to remember. Women would become practical, scheming, and ambitious. How many who have read the late Disraeli's Endymion wish to emulate the women found there, who are continually plotting for the lordship, even premiership of their favorites?

If woman votes, she will be unwilling to remain where her uplifted hand may be counted but beyond the reach of her voice. To become an important factor in politics she must engage actively in law-making, for we have already seen that the ballot of women will not tip the balance of votes. No woman can eagerly wish for fat office; surely not the mother of clinging children. A truth well endorsed by this verse:

"I have been flattered by admiring eyes,
Some words have writ which critic's said were wise,
Have spoken to the plaudits of the crowd,
Had thanks for kindness till my heart was proud,
But ne'er had praise which thrilled me through and through,
Like baby's lisp—'you old dood muzzor, you!'"

Better taxation with never a representation if it will taint the whole, even part of the home. Woman knows, for God has written it in her heart, that she should be virtuous let what will befall. Formed with quick intuitions, given the open Bible, the Creator designed woman for a bulwark of virtuous strength to this nation. Men see the need for reform and are working for temperance and purity, but *real* reform is slower through legislation than through earnest individual effort. The universal ballot will avail

nothing, but the out-stretched hand with heart in it will avail much.

GOLDEN GRAINS.

ARTHUR HELPS says: "Be cheerful, do not brood over fond hopes unrealized until a chain, link after link, is fastened on each thought and wound around the heart. Nature intended you to be the fountain-spring of cheerfulness and social life, and not the traveling movements of despair and melancholy"..... .....

VALUE the friendship of him who stands by you in the storm; swarms of insects will surround you in the sunshine. .....

THE Journal of Education says: "Neither matter nor mind, nor both combined, could keep this world from becoming a howling wilderness without moral forces." It should have added that moral forces are but the manifestation of the spirit of God—and He who created order out of chaos, will perpetuate it, though the agency of both matter and mind are moral force... ....

THE Tribune and Farmer, says: "God sends his rain upon the just and the unjust alike, and He makes His seasons the same for all men; but tempered drought and lessened flood, earlier Spring and later Fall has the man with a well-drained farm" ....

IF time is money, not only must the time be improved and valued, as if it were money, but its products are to be saved. Thrift means not only saving time, but saving money. Young people need to learn the virtue of economy even in their pleasures. A Western millionaire, when a lisping child, took his penny to the store and bought a stick of candy, and said: "Three thuckth a day, and thith will laththth five dayth." ....

AN Exchange says, and it cannot be repeated too often: "Nothing is more thoroughly mistaken than the idea that a women fulfils her duty by doing an amount of work that is far beyond her strength. She not only does not fulfil her duty, but she most singularly fails in it; and the failure is truly deplorable. There can be no sadder sight than that of a broken-down, over-worked wife and mother—a woman who is tired all through her life." Unfortunately this idea of duty, *i. e.*, the doing of work beyond her strength, too often comes to woman only after the heat and burden of life should be over. When the mantle of labor—not of duty—should be placed upon those younger and better able to bear it.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

PITHS.

AVOID fall colds.

We would rather have a clean cellar than a clean parlor.

Mend kid gloves with fine thread, not silk, of the same color.

Don't allow yourself to make unexpected visits.

It will pay to have suitable clothing in readiness for the first cold days.

We think most women can spend their time more profitably than in piecing bed-quilts.

Have at least one stove up besides that in the kitchen, in which you can build a fire during the cool autumn days and evenings.

A cheap disinfectant is made by dissolving a half pound of copperas in a gallon of water. Bottle and use for destroying the noisome odors in sinks, pails, etc.

We would that the "company parlor" might become extinct.

GRAND ARMY GOSSIP FROM THE GOLDEN GATE.

THE G. A. R. has come and gone. San Francisco has "welcomed the coming, and sped the parting guest," and the streets that one short week ago were almost impassable on account of the throngs of people that filled them, now look almost desolate, and the native San Franciscan wears a sort of "I-feel-like-one-who-treads-alone-some-banquet-hall-deserted" air, as he passes down Kearney Street. The buildings that a few days since were gay with bunting in patriotic colors and flags and pennants and banners of every device, have once more resumed their somber, work-a-day dress. Still California has done her duty in the matter of hospitality and patriotism, and praises of the success that attended her efforts are heard on every side. The grand parade was one of unparalleled magnificence, and occupied four hours in passing a given point.

Every day had its excursion and pleasure trip. Among the most enjoyable of these was that to San José and Santa Cruz. At the entrance to the latter city was an immense arch of greens bearing this floral inscription: "Santa Cruz Surrenders to the G. A. R." A feast was spread in the plaza, the guests being protected from the sun by arbors covered with green boughs. This banquet took the form of a huge barbecue, at which 14 beeves and 27 sheep were roasted. The tables, besides, were spread with cakes and fruits of every description. A bouquet of choice roses was placed at each place, and also a button-hole bouquet. Over 3,000 people were fed, and in the matter of consumption of food reminded one of the difference between it and that other multitude that were once fed on three small loaves and a few fishes.

Although the strangers who have visited us during the encampment have seen only the most disagreeable weather of which California is guilty, the general idea is that it will be followed by a considerable immigration to this coast. First impressions, however, are not always true ones, and the air of festivity that California has worn is calculated to throw a glamor over everything connected with it. It is always well in choosing a partner for life or a place of residence, not to do hastily that of which you may have to repent at leisure.

BEATRICE.

LITTLE HELPS FROM CORRESPONDENTS.

MRS. B. writes that she always freshens her salt pork in skim-milk. When frying she sprinkles a little sugar over the slices before turning.

"B" THINKS that as a rule salads are poorly appreciated by country people.

ADA WILLIAMS says that trying to get warm and to keep so on a cold day by an open fire, is the most discouraging thing that she has ever undertaken. Toes and face are burning while the rest of the body feels chilly. She prefers an "ungainly black monster" to a "wide generous hearth."

ACCORDING to a friend, machine oil can always be taken out of muslin if the spots are first washed with cold water and soap.

MRS. O. D. says that the reason why canned peaches are so often beautiful to the eye and insipid to the taste, is that they are used in an unripe state, sacrificing their delicious flavor for appearance sake.

J. H. puts her sugar in a tin pan to keep it away from the little red ants.

A WORD TO CHARITY.

PATIENCE, dear Charity Sweetheart! Our minister said in a sermon lately that the work that men and women are put into this world to do, is generally done between the ages of 30 and 50. All the years before are but preparation for that work. It may be crowded into and finished in 12 months' time, but we need years of discipline to fit us for it whatever it may be. I see sometimes old people who, I am told, were stern and hard, almost cruel, in their younger days; now they are gentle, kind, unselfish, but it required many years, even with the help of grace, to build up such characters.

"Those boys" ought to be cleanly for the sake of health and common decency, and a little interference in the shape of parental authority or sisterly suggestion might do them some good, but we must not shrink too much from the world's dirty work. Somebody has to do it. Think of the work of physicians and nurses. Not for money alone, not because they are lacking in refinement or feeling, but for the cause of science and for the sake of suffering humanity they bear disagreeable and disgusting things, and make no sign. Life with plenty of books and the companionship of refined, intellectual people for its principal feature, would be an existence so purely ideal that I fear comparatively few realize it, and such a life might become selfish indulgence. Many fail from sad necessity in this world, but I trust Charity Sweetheart will not be one. I prophesy that with "lofty endeavors" she will reach the hills of high achievement whence perhaps she will look back upon the hard road she has trodden with tenderness, and sometimes long for its scenes again. Those of us whose lives are failures can live again in watching the progress of others and cheering them on. C. W. M.

PRESERVING WILD FRUITS.

IN parts of the West fruit is scarce this year, and enterprising house-keepers make use of the wild fruits of the country, which still grow abundantly in many places. It was discovered years ago before the present mode of canning fruit had come into such universal use, that wild plums could be kept nicely for several months, and would be found to have lost that disagreeable acrid flavor, which is common to them. The plums when gathered were put into a stone crock, large or small as desired, and boiling water was poured over them in sufficient quantities to cover them: then a cloth was spread over the top and a plate was put over that to keep them under the water. No other care was required. They were kept in the cellar and used as wanted.

Wild crab apples which also have a disagreeable flavor, may be made very presentable for the table by first boiling them up in saleratus water—a teaspoonful for a quart of water. When the apples become tender, pour this off and with a clean cloth squeeze out the cores, which are small and will come out entire. Then stew the apples in molasses, with a little water added. When well done this makes very nice sance. Perhaps the absence of the best apples may give them a relish they might not have otherwise. They were always considered an addition to the table of an "Old Settler."

Wild grapes were also pressed into service and made a good and lovely colored-jelly. They were handled very much as currants would have been if jelly was to be made from them.

Tomatoes will figure largely this year as preserves, which is the surest way to keep them. Lemons should be generously used to flavor them. AUNT RACHEL.

WATER FOR THE SUPPER DISHES.

IF Mrs. Jack would turn a dipper of cold water over her supper dishes, and let them stand till morning, it would save heating the house at night. Or, have a kettle of water hot before the fire goes out. It will keep warm enough to wash supper dishes. MRS. H.

AUTOGRAPH APRON.

I NOTICED a very pretty apron that an ingenious young friend of mine wore recently, and it occurred to me that as it was original with the young lady, it would probably be new to the readers of the RURAL. The material was white linen, the threads were drawn, and a hem an inch wide was hem-stitched in. One corner was occupied by an immense spider-web, worked with etching stitch in light blue working cotton. Among the meshes of this web were the names of various friends, written in their own hand-writing, and embroidered with different hued cottons. Some were merely initials, others the first name, and still others had written the whole name, in different degrees of elaborateness. The opposite corner contained a beautifully drawn bird, with a scroll in its mouth bearing the name of the artist.

Some curious hieroglyphics, that might have been copied from an Aztec monument, I found upon translation were these words written in short-hand,

"Genevieve of old,
Against the bitter cold.
"Wore apron more bold."

The young lady's name was Genevieve, and doubtless in after life this apron will serve to recall to her many sweet and happy memories. The embroidery should all be done by one hand, to preserve a neat effect, as no two people, unless skilled in the art, embroider alike. AUNT EUNICE.

DOMESTIC RECIPES.

COOKIES.

THESE are good and can't hurt children. One cup of cream, one cup of sugar. If sour cream is taken, use one teaspoonful of saleratus dissolved in a very little water; if sweet, use the same quantity of baking powder. Season with cinnamon, make stiff enough to work easily. MRS. J. H.

AUNT ANN'S WHITE MOUNTAIN CAKE.

One-half cup butter, one of white sugar, two eggs, one-and-one-fourth cup of flour, one-half cup of sweet milk, one teaspoonful of cream-of-tartar, one-half teaspoonful of soda Bake in four tins. Make white of one egg into frosting and spread between the layers. MRS. B. C. D.

WHAT OTHERS SAY.

LUCY M. HALL, M. D., in the Christian Union, says there are two things she most devoutly wishes. The first is that every girl would grow up a tomboy. The second is that that most unjust and mischievous word had never been compounded.

THE same sensible writer thinks that the notion that a sickly, peevish girl is more of a lady than one who is bright, rosy and joyous, bubbling over with the high spirits of health, is a fatal mistake.

HARPERS' BAZAR says that the purest butter that was ever made may become tainted and poisoned in one short hour by objectionable surroundings.

WILLIAM STREET, in Philadelphia Press, says that it is all over with a mistress when she says to the children or the servants, "I will tell your father, or my husband, if you will not obey me."

Catarrh

Is frequently an indication of a Scrofulous taint in the system. Ayer's Sarsaparilla purifies the blood, and thus restores health to the affected membranes. It also stops the nauseous catarrhal discharges, and prevents the infection from reaching the lungs and stomach. Catarrh should be treated as a blood disease.

I suffered for years from chronic Catarrh. My appetite was very poor, and I felt miserably. None of the remedies I took afforded me any relief until I commenced using Ayer's Sarsaparilla, of which I have now taken five bottles. The catarrh has disappeared, and I am growing strong and stout; my appetite has returned, and my health is fully restored.—Susan L. W. Cook, 909 Albany st., Boston Highlands, Mass.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

JACKSON ARCHITECTURAL IRON WORKS.

Iron Work of all kinds for **Buildings.**

Office 31st EAST 28TH STREET, NEW YORK.

STABLE FITTINGS A SPECIALTY.

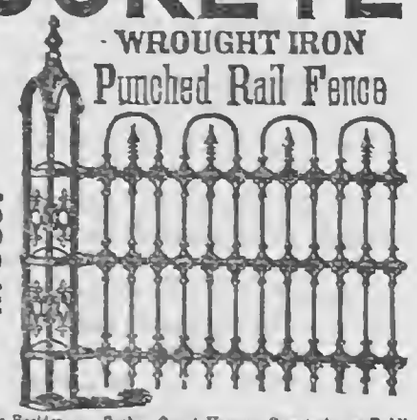
SALT. ONONDAGA F. F. SALT. SOLE MANUFACTURERS, American Dairy Salt Co. (Limited.)

Chemically purified and WARRANTED pure as any in the market Used by a great majority of the Dairymen of the country. Unexcelled for Butter, Cheese, the Table, and all Culinary purposes. Took Medal at Centennial "for purity and high degree of excellence." Dairy goods salted with it took first premiums at New Orleans World's Fair, N. Y. International Fair; Milwaukee Exposition, and always wins when there is fair competition. It is American, and *cheaper and better* than any foreign salt. Try it. Address

J. W BARKER, *Secretary*, Syracuse, N. Y.

BUCKEYE WROUGHT IRON Punched Rail Fence

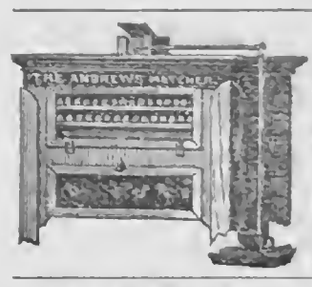
Acknowledged to be the Best Iron Fence now in Use.



Suitable for Private Residences, Parks, Court Houses, Cemeteries or Public Grounds—made either Plain or Ornamental Also, manufacturers of the IRON TURBINE WIND ENGINES, BUCKEYE FORCE PUMPS, BUCKEYE LAWN MOWERS, ETC

Send for Illustrated Catalogues and Prices to

MAST, FOOS & CO., Springfield, Ohio.



Best Hatcher ON EARTH.

Hatches Ducks, Turkeys, Geese and Chickens. Received First Premium where exhibited. Send for Circular.

ANDREWS' **Hatcher Co.** Elmira, N. Y. Mention RURAL N.-Y.

BLAIR'S FODDER SQUEEZER

A GRAND SUCCESS. 10,000 FOR 1886.

With this instrument one man can do the work of two with greater ease and much more expeditiously. Not only for Corn Fodder but for most all like bulky material in shock or bundle. For sale by hardware dealers. Send stamps—50c.—by mail for one, without rope. P. BLAIR, Bucyrus, Ohio.

REMOVE STUMPS and BOULDERS WITH **FORCITE POWDER!** THE CHEAPEST AND BEST METHOD. *Send for Circular mailed free.*

American Mfg. and Supply Co. [LIMITED], 123 Malden Lane, N. Y.

When Baby was sick, we gave her Castoria
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

News of the Week.

HOME NEWS.

SATURDAY, September 11, 1886.

SEVERAL minor earthquake shocks have been felt in Charleston since last Saturday, greatly frightening the people whose nerves were already overtasked, and prostrating or damaging still more a number of buildings already demoralized by previous shocks. For days and nights the alarmed inhabitants camped in the widest streets, squares and other open places, nearly starving at first because afraid to venture into the narrower streets to get food from home or the stores, as chimneys, etc., were toppling down frequently and whole buildings might crash down on them in case of another shock. A very large proportion of the town will have to be rebuilt, and nearly all of the houses need strengthing and repairing. A number of fissures appeared here and there in the city, and still more in the adjacent country, where many houses were damaged or thrown down, and many people injured, and a few killed. Relief societies were at once organized in all the chief towns of the country; and especially in this and other Eastern and Southern cities which have much commercial relations with Charleston and the tributary country. Large contributions were at once telegraphed by private individuals, companies and organizations like the Stock and Produce Exchanges, and within the first week over $100,000 was forwarded, besides a vast amount of provisions and clothing. More contributions are still pouring in, and there's no doubt but all the help needed will be given. What is now wanted are loans to enable the people to rebuild and resume business.....

Sea serpent seen in Connecticut River Tuesday. Head five feet out of water; large as the smoke-stack of a steamer. Two "credible witnesses"—nobody else ever sees it..... Federal officials are again warned against interference in politics—this time by the Acting Secretary of the Treasury.....Judge Thomas C. Manning, of Louisiana, is to succeed United States Minister Jackson in Mexico.....People getting tired of the Cutting affair—excitement dead on that score; but other complaints of illegal imprisonment of other Americans excite some interest. The Republicans, as a party, are opposed to trouble with Mexico, but favor a "vigorous policy" with regard to Canada...Another American fisherman has been seized. The Canadian authorities declare that our seizures of Canadian vessels in the Behring Sea were illegal, as seals are not fish, and anyhow the captures were made over 120 miles from land. It is said that English war-vessels on the "Atlantic station" are to assemble at Halifax and aid the Canadian cruisers to prevent Americans from fishing within the tabooed limit..... .....At Northmond, Sullivan County, Pa., Thursday night a shanty, in which 56 Hungarian workmen were sleeping, took fire, and seven were cremated.....The Louisiana State Board of Health is strongly of opinion that there are several cases of yellow fever at Biloxi, Mississippi, a Southern watering-place on the Gulf—exodus of visitors.... .. Nearly $4,000,000 in gold has been shipped into this country since August 14. Crops going out, gold coming in. .....Horace Chase, one of the founders of Milwaukee, died September 1.....The aggregate Internal Revenue receipts for July, 1886, just published, show an increase of more than 10 per cent. over those of July, 1885, about two-thirds of which are from spirits. The figures are for July, 1885, $8,832,198, and for July, 1886, $9,735,488. Anti-Prohibitionists attribute the increase to the Prohibition agitation!..... .....According to the new Pennsylvania marriage law, a license must be obtained in the county in which the ceremony takes place. A parson was fined $100 at Philadelphia Thursday, for marrying a couple on a license issued in another county.....Monday was "Labor Day"—a holiday with many workingmen. About 20,000 paraded here, 15,000 in Brooklyn, 18,000 in Boston, 14,000 in Pittsburg, 22,000 in Chicago, and proportionate numbers in other centers of labor. Lots of speeches, music and bunting .....The inland revenue receipts of the Dominion of Canada for the year ended June 30, 1886, amounted to $5,883,580, making with additional miscellaneous collections, a grand total for the year of $6,396,330..... ... It is stated that the Knights of Labor organization will be remodeled after the system of the Federal Union. The leaders of the miniature National Party in Mass. have invited the Knights of Labor to take part in politics with them. In Connecticut a convention of delegates from labor organizations has nominated a State ticket. The impression is growing in the New England States that the Knights mean to become a power in politics. .....The Court of Appeals of New York State is said to stand four to three against boodle Alderman Jachne's appeal, so it is likely he will serve his full time in Sing Sing. His lawyer, however, who also acts for the other boodle aldermen, says he has discovered a technical flaw in the manner of making up the grand jury which brought indictments against the "boodlers," and that this will be enough to vitiate every case on which it acted. ....."Does Prohibition prohibit," is the latest conundrum of the high-license, local-option and anti-saloon people. Each says his own check on liquor selling is a much stronger stimulant to temperance than Prohibition, which they say cannot be enforced at all in large towns, and only partially in small ones. Prohibition is certainly the great side issue now everywhere, and it looks as if it would become a main issue soon in National and State politics....."Ex-President Arthur continues to improve," say the New York papers. "Ex-President Arthur is again in a serious condition," say the Chicago and St Louis papers.....Recent discoveries here, in Newark, N. J., and in several other parts of the country leave no doubt of the truth of the impression that roller-skating rinks are nurseries of vice. The "fever" is fast subsiding; and late revelations should close every such den in the country.....Forest fires are "raging terribly" in the country about Calais, Me. Waters in rivers and lakes not so low for years.....Drought still very severe about Tolono, Ill. Streams dry; fish dead; stock driven long distances to water. Corn parched. Earth full of cracks. Soil baked.....The revolution against the General Government is assuming "alarming proportions" in Tamaulipas, Mexico. Insurgents number 1,000 well mounted. Revolutionary strength reported as great in Nuevo Lion and Coahuila.....The America Cup was won from the best English yachts about a quarter of a century ago by the yacht America, and several attempts have since been made by crack English yachts to recapture the trophy. Last year the Yankee sloop Puritan defeated, in two straight races, the English cutter Genesta. This year the English cutter Galatea, said to be faster than the Genesta, has come across to try for the Cup; and Yankeeland built the Mayflower, which has proved faster than the Puritan, to defend it. In a 40-mile race on Monday the Boston flyer outsailed the English clipper by nearly 12 minutes. They started again for an ocean race Thursday, but a dense fog and light breeze stopped the race. Mayflower ahead, however. To day they are racing again and (now, 3:30 P. M.) Mayflower is 2¼ miles ahead. .....At last Geronimo, Natchez, and their band of 40 adults and three children, surrendered to Captain Lawton, on September 4, "unconditionally," it is said; but many believe so wary a chief would never have given in without assurances that his life would be safe. On September 9 a special train of three cars left Bowie Station, Arizona, with the whole band in charge of Lawton, bound for Fort Marion, Florida, General Miles going with them as far as El Paso. Other turbulent Indians, taken from the Apache Reservation, met them at Albuquerque, and are to be also transported to Florida. Geronimo escaped from Fort Apache May 17, 1885, and took with him 34 bucks, eight boys, and 91 women, traveling 120 miles before camping, with pursuers hot on his heels nearly all the time. Since then he has been hunted by nearly all the cavalry of the United States and Northern Mexico, and though wounded much of the time, he could not be captured. His cruelty deserves death, but his unparalleled hardihood, skill, pluck, endurance and courage deserve admiration. He may be imprisoned for life, or tried by court-martial and shot, or surrendered to the authorities of Arizona for trial, which would mean certain death for his multitudinous murders and other atrocities.

FOREIGN NEWS.

SATURDAY, Sept. 11, 1886

IN Europe the Bulgarian embroglio still "holds the field." Owing to the lond entreaties of the army and people of Bulgaria and Eastern Roumelia, Prince Alexander stopped on his way to Darmstadt, and at the instigation chiefly of England, returned last week to Bulgaria, where he was enthusiastically received. The chief conspirators against him were tried and condemned to death, but all were soon released owing to the pressure of Russia in their favor, and it soon became evident that the Russian influence in the Balkan States was so powerful as to cause a civil war should Alexander remain, and that would give Russia a pretext for occupying the country, and virtually taking possession of it. Alexander by the advice of Emperor William, wrote an abject letter to the Czar, protesting his devotion to Russian interests; but the answer was curt and brutal, telling the Prince he had better quit the country or trouble to himself and it would follow. Russia used every means to get rid of him. Austria was lukewarm. The German people were inclined to be enthusiastic in his favor, but Bismarck grimly declared that if he were an angel, it wouldn't be worth while for Germany to offend Russia on his account, so the unfortunate young man resigned the title he had just resumed, and once more started for Darmstadt where he arrived yesterday. On the road he was heartily greeted by enthusiastic crowds. A regency was appointed to look after Bulgarian affairs until a successor shall be elected. He may possibly be re-elected, and then there will be trouble for certain, and most likely there will be trouble soon anyhow. The Balkan States are now virtually provinces of Russia, which guarantees a loan of 10,000,000 roubles, sends a general to command the army, and an envoy to manage civil affairs. Whether England, Turkey and Austria will view this state of affairs quietly is doubtful ....Turkey evidently fears a war with Russia, and is conscripting all Turks of military age in Europe and Asia Minor. The harshness of the conscription is causing much discontent in Asia, as the families of the conscripts are starving. Artillery and small arms are being bought on all sides, and earnest preparations for war in Europe and Asia are being pushed forward. There is talk of a confederation of Bulgaria, Roumania and Servia, which could put 500,000 men into the field; and England is trying to bring it about as a barrier between Russia and Turkey. Austria is dissatisfied with Russian predominance on the Peninsula, but is held in check by Bismarck. Some say she will push to the sea at Solonica, appropriating Bosnia and Herzegovina, and allow Russia to push to the sea at Constantinople, after appropriating all the States north of it abutting on the Black Sea. Italy is strongly opposed to Russian designs as likely to bring the mighty Muscovite Power close to her on the Mediterranean. Germany's attitude is a puzzle to diplomatists, as they think she ought to desire to humble Russia, as there must probably be a war between the two before long. At present Bismarck appears to be playing second fiddle to De Giers, and favoring Russian pretensions in every way. France thinks her position is bettered by the embroglio. Her army was never so large or well equipped. Her navy is hardly second to that of England. Whatever side Germany may take in any war, France is sure to take the opposite, and most think the present attitude of Germany is due to Bismarck's determination to prevent a Franco-Russian alliance at all cost. Hence the concessions to Russia are the price of a continuance of the "Triple Alliance" ....England's army is insignificant in numbers in comparison with those of the great Continental Powers, and she cannot fill it up by means of conscription, the only means by which other European Powers keep up their vast armies. Moreover, it is scattered all over the world, and the present disturbed condition of Ireland keeps upwards of 40,000 troops there; and probably twice that number will be needed the coming Winter, if the threatened evictions take place. Moreover, trouble is feared in her East Indian possessions, as it is known that Russian agents have lately been inflaming the natives against the British, and in favor of the Russians. The latter have been pushing their railroads east with all speed, and can now transport troops by rail nearly to the borders of Afghanistan, and in case of war with England no doubt the latter country and probably India, also, would be involved in the contest. Hence England is cautious; though strongly opposed to all the Russian projects in the southeast of Europe. There's very little "jingoism" just now, but it would not take much provocation to rouse it against Russia.

Honors at Home and Abroad.

THE Whitman Continuous Hay and Straw Press was awarded the First Prize Silver Medal at the New England Fair (Bangor, Me.) this week; also First Prize at the late International Rural Fair, Buenos Ayres, South America. This, in addition to the Great World's Fair and many others, should be very gratifying to the Whitman Agricultural Co. of St. Louis, Mo., who will furnish any information desired.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, Sept. 11, 1886.

AT West Chester, Pa., Wednesday, about 700 bushels of wheat stored in an upper floor of the barn of Darlington Strode, in East Bedford, proved too heavy for the joists, and the floor giving way, crashed into the cow stables. Twenty-two cows were in the stable, seven of which were smothered to death by the grain or killed by the falling timbers. Most of the cows taken out alive were more or less injured .....Thursday, at Jacksonville, Ill., Charles Spain and Everett Ellis, aged 11 and 13 years respectively, were smothered to death while playing in a wheat bin from which the grain was being drawn,.. ....The above two items are simply specimens of many accidents reported, due to similar causes.....Counsel, "the best trotting horse on the track" at the annual meeting of the Council Bluff's Driving Park Association, belongs to G. W. Barley, of Fairbury, Neb., was sold for $10,000 the other day..... ....Texas fever prevalent among cattle at Decatur and Jerseyville, Ill., contracted from Texas and Cherokee cattle bought at St. Louis.....Hog cholera very fatal south of Muncie, and about Peru, Ind..... ....It is reported that nearly half the oleomargarine exports from this country return in the shape of foreign cheese..... ..... The fourth annual meeting of the Veterinary Medical Association was held at Columbus, Ohio, the other day. Laws for shutting out quacks and giving protection to professionals are to be sought. Incompetents having been driven out of New York and W. Va., are said to have found a welcome in the Buckeye State. The following officers were elected: President, T. D. Cotton, of Ohio; vice-presidents, R. J. Withers, of Chicago, A. J. Chandler, of Michigan, and T. L. Armstrong, of Indiana; recording secretary, C. B. Robinson, of Wheeling; corresponding secretary, James Hamill, of New York City; treasurer, L. V. Plagemann, of Brooklyn..... The Democratic convention of California demands the restoration of the tariff of 1876 on wool.....The principal authorities in the grain trade in Great Britain agree in predicting a higher range in wheat prices during the coming cereal year than has prevailed during the past one.....English agricultural returns for 1886 show that the acreage of land under wheat this year is 2,286,066 acres. This shows a falling off of 7.8 per cent. compared with last year, and of 14.6 per cent. compared with 1884.....The exports of live stock and dressed meats from the port of Boston last week were 1,173 cattle and 3,179 quarters of beef.....In the last ten years Canada cattle increased about 30½ per cent. against an increase of 63 per cent. in the United States.....

It costs about $25 per head to carry cattle from Canada to the English markets... .....A second New Jersey Horticultural Society was organized Thursday. President, James R. Pitcher, of Short Hills; chairman of the executive committee, J. P. Knorr, of Orange; treasurer, Thomas H. Spaulding, Llewellyn Park; secretary, John Farr, Short Hills..... .....The exports of genuine butter from the United States have fallen from 40,000,000 pounds in 1880 to 21,638,138 pounds in 1885, or nearly one-half, while the exports of butter substitutes have increased from 20,000,000 pounds in 1880 to 39,000,000 in 1885. .....The Hessian fly has just been added to the many other plagues of the English farmer. Miss Ormerod, Consulting Entomologist of the Royal Agricultural Society, has "positively identified it" near Hertford, and farmers are cautioned against it—but what good will that do? It has long been a pest in Germany, the wonder is that England has hitherto escaped.

A Friend of the Family.

THE desirability of a permanent and effective remedy in the household in cases of croup, scarlet fever, asthma, hay-fever, insomnia and sore throat will be admitted by everybody. Such a remedy exists in Drs. Starkey & Palen's Compound Oxygen, which is made by them and dispensed from 1,520 Arch street, Philadelphia, Pa., to almost every part of the world. Of this fact *Elmer E. Burlingame*, of Elmira, N. Y., wrote September 14, 1885: "I know Compound Oxygen to be worthy of the highest praise, having used two Treatments of it in my family during the past year with wonderful results." Complete information as to the methods of Treatment and the highest testimonials may be obtained free by any applicant.—*Adv.*

Crops & Markets.

SATURDAY, Sept. 11, 1886.

The Mark Lane Express, in its review of the British grain trade during the past week, says: "The rainfall of the week has done no harm to crops. In the earlier districts the bulk of the harvest has been secured, and where the crop has not been reaped strong winds counteracted the wet. The change in the weather will retard the appearance in the market of new wheats, and will also be an important factor in determining values. The sales of English wheat during the week were 29,892 quarters at 33s. 1d., against 39,709 quarters at 32s. 4d. during the corresponding period last year. Foreign wheats are steady, but with little doing.

The fourth series of London wool sales of the year, at which 266,000 bales are to be disposed of, commenced Saturday last. There was an unusually large attendance of home and Continental buyers, and competition was very animated. Since the close of the last series there has been an active demand, which has resulted in the private sale of 20,000 bales at two to four cents above the average rates of the series. The values realized the first day of this sale show the following advances compared with the closing rates of July: Australian—Greasy and merino seven cents; washed and scoured four to six cents: do. cross-breds two cents. Cape of Good Hope and Natal—Greasy four cents, do. fleece and scoured six to seven cents.

Early-planted potatoes are reported to be generally good in the West; but late-planted are poor, and in many districts a flat failure.

Hogs are generally reported well, with only scattering cases of cholera as yet.

Here are some dairy items from strong dairy centers:

ELGIN, Ill., September 6.—Under strong demand butter advanced 1 cent to-day, the sales on the call board being made 24 to 25 cents for all offerings, closing firm, with many orders unfilled. Cheese firm. Full creams at 7¼ to 8⅛ cents for cheddars and flats; young Americas at 9 to 10 cents; skims at 3 to 7½ cents, according to quality.

LITTLE FALLS, N. Y., September 6.—Cheese—Prices 1¼ cents above those of last week. Sales, 4,200 boxes at 9½ cents; 3,260 at 9¾ cents; 1,100 at 10 cents; 1,200 on commission, and 960 of farm dairy 8½ to 10 cents, the bulk at 9½ cents. Butter—Sales, 40 packages at 18 to 20 cents, the bulk at 20 cents.

UTICA, N. Y., September 6.—Cheese—Market 1 cent higher and active. Sales to-day 100 boxes at 8¼ cents; 40 at 9 cents; 5,000 at 9¼ cents; 2,700 at 9½ cents; 1,940 at 9⅝ cents; 1,250 at 9⅜ cents; 575 boxes on private terms, and 1,000 on commission.

Frost one night last week in much of the West, according to Western reports, did very little damage to the growing corn, while it hastened maturity. A week ago in sections of Missouri, Kansas, Iowa and Minnesota a portion of the crop has sufficiently matured to be beyond danger from frost. The reports indicate that, as a whole, the corn crop will be out of the way of frost within ten days. The general prospects for the output of corn show no marked improvement. The reports from all the States, except Ohio, Indiana, Michigan and Minnesota, continue to predict a short crop.

According to the Maine Farmer the hay crop of the Pine-Tree State is about one-fourth larger than last year. It has been gathered in splendid condition, and has never been excelled in quality. Two weeks more of warm weather will produce a large output of corn. Apples, also, promise well, but the yield of potatoes will be below the average.

The Chicago report of the visible supply of grain in store in the United States and Canada on Saturday, September 4, and the increase or decrease from the preceding week is as follows: Wheat, 42,965,625 bushels, increase, 1,667,749 bushels; corn, 13,192,387 bushels, increase, 1,422,706 bushels; oats, 4,949,360 bushels, increase, 704,007 bushels; rye, 515,485 bushels, decrease, 55,200 bushels; barley, 808,090 bushels, increase, 22,850 bushels. The proportion in Chicago elevators was: Wheat, 7,911,000 bushels; corn, 5,796,900 bushels; oats, 2,013,000 bushels; rye, 231,000 bushels; barley, 488,000 bushels.

A telegram from Minneapolis, Wednesday, says the mills last week turned out 141,200 barrels of flour, averaging 23,230 daily, against 152,110 the preceding week, and 65,470 the corresponding time in 1885. The trouble from low water is probably at an end. The heaviest rains ever experienced in that section fell on Monday over the country south of the Northern Pacific Road. The river had previously risen, and on Wednesday had enough water. This week's output will likely reach 150,000 barrels. The mills had not yet begun to use much new wheat, on account of the large supply of old. Exports last week were 58,135 barrels. The production of all city mills for the year ending Sept. 1 was 5,936,530 barrels. Receipts past week—Wheat, 718,850 bushels. Shipments—Flour, 137,170 barrels; wheat, 61,050 bushels; millstuff, 3,887 tons. Wheat in store—Minneapolis, 2,923,404 bushels; Duluth, 3,547,783; St. Paul, 410,000.

Owing to the abundance of feed in many parts of the Ohio Valley and Atlantic States the demand for stock cattle has been noticeably increasing of late; but buyers are unwilling to invest, except at bottom prices. An unusually active demand for breeding stock is also reported; but here also, great caution is exercised by buyers. The taste for good stock is steadily growing among farmers; but they do not care to pay "boom" prices for anything. The business between breeders and breeders is said to be quite limited of late, while that between breeders and farmers is growing in a steady, healthy fashion.....

More attention than ever before has lately been given to overstocking the cattle ranges of the West, and the general impression is that the evil has proved such source of loss as to necessitate speedy correction. The injury to the owners' pockets is likely to lessen the suffering and mortality among range stock before another year.

Although there is a deficiency of 470,000 tons in the sugar-beet crop of Europe, for the season of 1885–6, the visible stocks of sugar are about the same as at this time last year, and prices are even lower. Prophets of higher prices disappointed and puzzled; general belief that last year, in Germany and Austria, there were large invisible supplies, kept quietly back to prevent a still greater fall in prices; these are now being pushed forward, and more than supply the shortage. Better prospects, therefore, for next year, as the invisible supply has for the most part become "visible," and is disappearing by consumption.

MARKETS BY TELEGRAPH.

SATURDAY, Sept. 11, 1886.

CHICAGO.—Compared with cash prices a week ago, regular wheat is unchanged. No. 2 Spring, ⅝c. lower. Corn, ⅛c. lower. Oats, ⅜c. lower. Rye, steady; ⅜c. lower. Flaxseed, 2c. lower. Pork, 15c. higher. Cattle, some grades a trifle higher; others somewhat lower; but prices are a little lower on the whole. Hogs, from 5c. to 15c. lower. Sheep, steady, except Texans, which are from $1.40 to $2 higher, chiefly owing to better character of receipts.

WHEAT active.—Sales ranged; Sept., 76@76½c; October, 77¾@78⅝c; November, 79⅝@80c; No 2 Spring, 76½c. CORN—Cash, 39⅝c, September, 39⅝@40⅛c; October, 41⅛@41⅝c; November, 42⅜@43⅛c. OATS.—Quiet; Sales ranged: Cash, 25¾c; September, 24¾@25⅛c; October, 26⅝@26⅝c. RYE.—Quiet; No. 2, 62c. BARLEY.—Dull. No. 2, 57½c. FLAXSEED.—No. 1, $1 83@1 84. MESS PORK.—Firm; Sales ranged: Cash, $10 36@$10 37½; September, $10 35@$10 37½; October, $10 27½@$10 47½; November, $10 17½@$10 30. LARD.—Steady, Sales ranged: Cash, $7 32½; September, $7 30@7 35; closing at $7 30@7 32½; October, 6 60@6 70, closing at $6 67½. Short Ribs.—Strong; Cash, $6 95. Boxed Meats.—Dry salted shoulders, $6 12½@6 25; Short clear sides, $6 10@7 15. CATTLE.—Shipping steers, $3 40@5 35; stockers and feeders, $2 90@3 25; cows, bulls and mixed $1 25@3 00; bulk, $2 00@2 25; through Texas steers, $2 50@3 10. HOGS.—Market steady; Rough and mixed, $3 90@4 80; packing and shipping, $4 75@5 50; light weights, $3 75@4 80; skips, $2 50@3 75. SHEEP.—Market lower; Natives, $2 00@4 00; Texans, $3 40@3 55; Lambs, $4 25@4 85.

ST. LOUIS.—Compared with cash prices a week ago, No. 2 red wheat is 1c. lower. Corn, ½c. lower. Oats, ⅝c. lower. Butter—Creamery, from 1c. to 2c. higher; dairy, 2c. to 5c. lower. Eggs, unchanged. Flaxseed 2c. lower. Pork, 25c. higher. Cattle, only slight fluctuations. Hogs, unchanged. Sheep, about the same.

WHEAT.—No. 2 Red, Cash, 76⅝@76¾c; September, 76⅝c; October, 78⅝@79c. CORN.—Dull; No. 2 mixed, Cash, 36⅝@37c; September, 36⅛c; October, 37⅜c. OATS.—Dull; No. 2 mixed, Cash, 25⅜@25⅝c; Sept, 25c.; October, 25@c. RYE. Sept, 48½c. BUTTER.—Creamery, 20@23c; dairy, 10@18c. EGGS, 12c. FLAXSEED.—$1 04½. HAY.—Timothy, $10 00; Prairie, $8 00. PORK, $11 00. BULKMEATS.—Long clear, $6 00; short ribs, $7 00; short clear, $7 10. Lard, $6 75. SEDGWICK STEEL WIRE FENCE

Is the best general purpose wire fence in use. It is a **strong net-work without barbs.** Don't injure stock. It will turn dogs, pigs, sheep and poultry, as well as horses and cattle. The best fence for Farms, Gardens, Stock Ranges and Railroads. Very neat, pretty styles for Lawns, Parks, School-lots and Cemeteries. Covered with rust-proof paint, or made of galvanized wire, as preferred. It will last a life-time. It is better than boards or barbed wire in every respect. Give it a fair trial; it will wear itself into favor. The **Sedgwick Gates** made of wrought-iron pipe and steel wire, defy all competition in lightness, neatness, strength and durability. We make the best, cheapest and easiest working **all-iron automatic or self-opening gate,** and the neatest cheap iron fences now made. The best **Wire Stretcher, Cutting Pliers and Post Augers.** For prices and particulars ask Hardware Dealers, or address, mentioning paper,

For the Young.

WHY should boys be so anxious to throw stones? I never saw a boy yet who did not think it was a great thing to be able to hit a mark with a stone or apple. When I was a boy I used to be a pretty good shot with a stone. Now what good does all this stone throwing do? I never heard of but one case where it did much good. A man out West told me that once, years ago, the Indians chased him over the mountains. He used up all his powder and at last hid behind a rock. There was nothing he could use in the way of a weapon but a pile of stones. He threw these with such strength and aim that the Indians kept back until help came. That may be true, but very few of us are ever going to live among Indians. Instead of learning how to fight, we want to learn how to avoid fighting, and it won't make any difference with most of us if we never can hit a barn door with a stone. When we find we can throw a stone straight, we are always wanting to see how near we can come to some animal without hitting it. I have known boys to throw stones at cows, dogs and sheep, and I know cases where such stones have done great harm. I know a boy who had his eye put out by a stone. Who ever knew of any good being done by a stone? I wish our boys would stop the practice.

ANOTHER very foolish thing that some boys practice is carrying a pistol. There is nothing more foolish than this. Boys or men who carry pistols are the worst kind of cowards, and I want them to know what I think about them. You needn't be afraid that robbers and murderers are going to attack you. The man or boy who minds his own business will seldom have any trouble, and the one who fights with right on his side will always win in the end. Some boys read about "Buffalo Bill" and "Texas Jack" and think it would be a fine thing to ride around all day with a rifle to fire off every half hour. I want my boys to look for something higher than that. We don't want any more such men as "Buffalo Bill" than we can help.

UP WITH THE BREEZE.

"Up with the breeze, the birds and the bees,"
I heard a boy sing in the morn;
And his hoe kept time with the merry rhyme,
As he cheerfully hoed the corn.

Down went the weeds and the noxious seeds,
And up went the emerald corn;
And I looked with delight at the gladsome sight,
The work of the early morn.

The broad green leaves turned to golden sheaves,
And the field of beautiful corn
Was gathered and sold, thus turned into gold—
The work of the early morn.

Then up with the breeze, the birds and the bees,
If you wish to grow wealthy and wise,
And merrily sing like birds in Spring,
While your work as merrily flies.

The poor sleepy head, who lingers in bed,
Will have more sorrows than joys;
And when he grows old will be hungry and cold,
So keep "wide-awake," my boys.

—*Unknown Exchange.*

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(*Continued.*)

After much stamping and pushing about the scholars settled into their seats. This confusion did not appear to be the result of any disrespect to me, but it seemed to be considered as a regular performance. School could not well be opened without it.

Two contests were at once begun. Mollie Brawn, finding her seat occupied, proceeded to pull the little girl out into the aisle and brace herself firmly in the seat. The ejected claimant began to cry and to rub her eyes with her apron. It took me several minutes to explain matters and compel Mollie to take the other seat. She got up at last muttering and shaking her head. Her first move was to run to my desk and secure the large red apple she had given me. She seemed to fear that I would try to capture it from her. That I might get as little enjoyment out of it as possible, she proceeded to take several large bites from different parts of it. These filled her mouth so full that her eyes were almost forced out of her face. Then she walked sulkily to the other seat where she sat sullenly scraping her feet on the floor. The other girls sympathized with her as far as they were able by making faces in my direction.

This trouble was hardly begun when I was called to settle a dispute that had arisen on the boys' side. Two of the largest boys were contending for a back seat. They had exhausted verbal argument and were now engaged in a wrestling match which was rapidly degenerating into a fight. A small boy, evidently the brother of one of the contestants, was jumping about in the rear of the battle seeking to get his brother's antagonist by the foot and thus help in throwing him.

I had to pull hard to get the two apart. Then I tried to investigate the trouble. It was hard to decide which one was entitled to the seat so I proposed that they draw lots for it. After some discussion, in which the whole school endeavored to take part, this plan was adopted and I prepared two sticks, which I held in my hand with the understanding that the boy drawing the shorter should find another seat. When the sticks were selected, and it was found that the largest boy would have to get another seat, there was a fresh discussion. The loser at once declared that I had said long instead of short in speaking of the sticks and some of the other boys said the same thing. At last the discussion became so noisy that I became tired of it and caught the defeated candidate by the collar and marched him to the new seat, where I placed him with very little ceremony. The effect of this abrupt argument was that when I rapped on my desk the entire school came to order and sat watching me. Mollie Brawn had by this time disposed of her mouthful of apple and sat scowling fiercely at me.

Of all the queer audiences that one is called upon to face, a strange school is the hardest. I must confess that I felt something akin to fear as I looked down upon the heavy, expressionless faces that met mine. It seemed somehow necessary for me to make some sort of a speech, yet what could I say to interest my audience? Before I could consider a proper line of argument, I found myself speaking.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I am a little girl eight years old. I have one sister and one brother, one Grandma, and she is living with us. We have one Grandpa. Pa. takes the RURAL. We have five sows and 30 little pigs, five horses, three cows and three calves, one cat, one dog, 15 turkeys, eight geese and a good many chickens. They are Buff Cochins, Brahmas and a few Plymouth Rocks. Ma. is canning pickles and tomatoes to-day. I like to read the letters from the Cousins very much. I never wrote a letter to the RURAL before and don't know if this will be a good one or not. Your niece,

ALPHA A. DENPREE.

Johnson Co., Indiana.

UNCLE MARK: I am a boy 16 years old but I am a subscriber of the RURAL NEW-YORKER and would like to be a Cousin. We live on a farm of 30 acres, two and one-half miles from Bay City. My brother Marty and I own the chickens and we have made $10 so far this year. We have 25 old hens, a peacock (that had a tail five feet long but it is all gone now) and a peahen with four little young ones about a week old. I think we will take them to the fair. I planted all the seed that you sent me and the corn all came up and I think I will have a good chance for the prize if nothing happens. Your Nephew,

ACKERSON N. BROCK.

[I would take them to the fair by all means. —U. M.]

DEAR UNCLE MARK: We live on the bank of the Mississippi River, and I have learned to pull a boat. If you ever come and see us I will take you out boat-riding. I have to walk two miles to school. I am keeping a lot of bird eggs. I have over thirty kinds. I wonder if any of the Cousins can beat that. I am learning to do all kinds of housework. I have seven brothers and three sisters, one brother living in Wisconsin, and one brother living in Minnesota, and five at home; two sisters in Wisconsin and one in Nebraska.

Your affectionate niece,

BERTHA L. BANTA.

Oquawka, Henderson Co., Ill.

DEAR UNCLE MARK: I would like to join the Y. H. C. I am ten years old. Papa has taken the RURAL for five years. He likes it very much. I have a little flower garden. I planted the Garden Treasures, but they did not come up because it was so dry. Perhaps the Cousins would like to hear about the hail storm—the hail-stones were as large as turkey eggs. The second time it was a mile from our place. It entirely destroyed the grain, and in some places it destroyed the grass. Papa has just harvested. He thinks the wheat will go 20 bushels to the acre.

From your niece, VIDA THOMSON.

Grant Co., Dak.

Scrofula

Probably no form of disease is so generally distributed among our whole population as scrofula. Almost every individual has this latent poison coursing his veins. The terrible sufferings endured by those afflicted with scrofulous sores cannot be understood by others, and their gratitude on finding a remedy that cures them, astonishes a well person. The wonderful power of

Hood's Sarsaparilla

in eradicating every form of Scrofula has been so clearly and fully demonstrated that it leaves no doubt that it is the greatest medical discovery of this generation. It is made by C. I. HOOD & CO., Lowell, Mass., and is sold by all druggists.

PERSONALS.

THE wife of President Diaz, of Mexico, is not yet 26 years old, and is a devont Roman Catholic.

ROSCOE CONKLING has had the beard along the side of his face closely trimmed. It now looks like hoar frost, and is whiter on his ruddy cheeks,

F. L. HARVEY, of the Arkansas Agricultural College, has been elected to fill the vacancy in the Maine Agricultural College occasioned by the resignation of Dr. Fernald.

THE Queen of Spain is suffering from pulmonary disease, which is making alarming progress. The affection is similar to that which caused the death of King Alfonso.

THE Michigan State Board of Agriculture has conferred the degree of Master of Science upon Prof. Samuel Johnson, for the past six years Professor of Agriculture at Lansing.

ONE of his friends estimates that with his city house in Philadelphia, his country house at Bryn Mawr, and his seaside house at Long Branch, Mr. George W. Childs spends $250,000 a year.

SENATOR SHERMAN'S house at Mansfield, O., is the highest point in the State. It is 1,300 feet above the sea level and exactly on the divide between Lake Erie and the Ohio River.

DURING a recent eight minutes' speech in the House of Commons, Lord Randolph Churchill was observed to make 130 gestures with his hands, besides numerous changes of general attitude.

CHARLES J. JAMES, a son of G. P. R. James, the English novelist of "two-solitary-horsemen" fame, peddles papers and makes ordinances in Euclair, Wis., where he is an Alderman, and preaches dynamite and anarchy between times.

ONE of the results of the earthquake was to cure the rheumatism of a citizen of Columbia, S. C. He had used crutches for years, but when the quake quaked he ran out of the house like a four-year-old steer, and he hasn't used his crutches since.

MRS. ANNETTE WYNNE, who lives in Washington Territoy, is the proprietress of a fine farm, which contains 420 acres, much of it in a state of high cultivation, and she conducts a stock and dairy business, all the work being done under her supervision.

THE other day at Kansas City, where he is keeping a small eating-house, Martin Irons, the leader of the great Southwestern railway strike, was locked up at the police station overnight on the charge of drunkenness, being unable to give bonds for his release. Fined $5.50 next morning.

MR. GLADSTONE takes every day two glasses of claret at lunch and two at dinner, with a glass of port wine. His alcholic consumption has been estimated by his son at seven gallons a year, which would be three and a half times the average consumption per head in England and four and a half times the average in Europe.

THE mother of General Philip H. Sheridan is 87 years old, and lives in a modest little house near the Hocking Valley, Pa. Her health is excellent, and she enjoys nothing better than a chat about her son. To a visitor she said recently: "You can excuse an old mother for being so proud of her son. He has always been good to me."

GENERAL LOGAN and Governor Alger, of Michigan, while in California, took off their coats and felled a tree that would cut into 108 cords of wood or furnish 36,000 feet of lumber. They could earn $50 a month any time they choose to leave their Eastern homes and occupations and accept a steady position in a red wood lumber camp.

MR. BENJAMIN BOWER, a resident of Pleasantville, N. J., sprinkled Paris-green on his grape-vines. The wind blew some of it in the face of Miss Allie Bower, his twenty-year-old daughter. She inhaled it unconsciously, and soon after became violently ill. A physician, who was summoned immediately, could do nothing for her, and she died in a few days.

IN 1875, Mr. James Lick, of California, left $700,000 for the erection and equipment of an observatory. The structure, on Mount Hamilton, in that State, will be ready for use in the Autumn of next year; and the University of California hopes to make it a gift to science, and not merely a gift to that State. Its immense telescope is the most important astronomical instrument in the world.

Miscellaneous Advertising.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your goocer for Dixon's big cake.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1913. NEW YORK, SEPTEMBER 25, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

The Herdsman.

THE SCRUB.

HE poor creature shown at Fig. 366 represents a class of cattle that is by far too numerous. Two weeks ago we gave a picture of what we consider one of the most beauful cows in this country. We may safely put this scrub down as one of the ugliest specimens of her race. Place the two side by side and observe the contrast. It is well to keep the appearance of our friends in mind, yet it is also useful to know how the enemy looks, that we may know him on all occasions. Such cattle as this old scrub are the enemies of all successful stock growing. It is the duty of all good farmers to unite in breeding and butchering them out of existence. This old cow can be seen any day on the Hoboken flats. There is something pitiful in the scarred face. It tells a sad story of abuse on the part of some cruel owner. With decent care and feeding, warm shelter and attention, this poor old wreck might have made a respectable cow, but hardly ever a profitable one. It is not the cow so much as the years of abuse on the part of her master, and the generations of wretched ancestors, that look out so mournfully at us. Could there be a more striking illustration of what man's cruelty and hereditary ungainliness may lead to? The lesson is repeated over and over again. There is much in breed, but there is still more in care and feeding. Turn the beautiful "Golden Thistle" out on the bleak flats and subject her to the treatment this old scrub has endured, and how much better than this pitiful old creature would her grandchildren be? Give this old cow proper feed and care, let her run with pure-bred cattle, and her grandchildren, if their parents were equally well treated, could easily lay claim to respectability.

THE SCRUB. Drawn from Life, Hoboken Flats, New Jersey. Fig. 366.

STOCK JOTTINGS.

A STATISTICAL HUMBUG.

MR. P. S. LAMAS is "an economist of great repute" in some parts of the world, especially in South America, from which he hails. He is certainly a tremendous compiler of figures; but we more than doubt their correctness. According to his computation there are on the surface of the globe 47,500,000 head of cattle and 105,000,000 of sheep. Europe and Algeria provide 25,000,000 cattle and 50,000,000 sheep, Australia, New Zealand and the Cape 2,500,000 cattle and 20,000,000 sheep, the United States and Canada 9,375,000 cattle and 9,750,000 sheep, the Argentine Republic and Uruguay 6,000,000 cattle and 24,000,000 sheep, and Central America 4,250,000 cattle and 1,250,000 sheep. Hasn't this scientist shown himself a pretentious humbug in these figures? According to the census of 1880, there were in this country, six years ago, 993,841 working oxen, 12,443,120 milch cows, and 22,488,550 other cattle, or a total of 35,924,511 cattle, and the number has largely increased since then, yet this "eminent statistician" allows to the Union and the Dominion only about one-third the number of cattle in the former. This country had in 1880, 35,192,074 sheep, nearly three times as many as he assigns to the United States and Canada. The figures for other countries are just about as "correct."

After an elaborate array of figures of live stock, the genius computes that the world's annual consumption of beef is 7,930,000,000 kilogrammes—2 1-5 pounds—or 17,446,000,000 pounds, and of mutton, 10,550,000,000 kilogrammes, and then apportions to the inhabitants of each county a consumption of a certain number of kilogrammes annually per head; but as his foundation is grossly false, his superstructure is, of course, a farrago of error. But we notice the figures are "going the rounds" of the papers, even the grave, statistical Bradstreet having given them last week without a word of comment.

LIVE STOCK IN BUENOS AYRES.

SCARCELY a week passes without sales of choice pure-bred English cattle for the improvement of the herds of Buenos Ayres. A large number of English and Irish men have settled there, and most of them are engaged in stock-raising—the chief industry of the Province. Lately some experimental shipments of dressed meats have been made to England, and the prospect of a profitable trade in this line is stimulating cattle owners to improve their herds; for it is only high-grades or prime stock that can pay when exported as fresh meat in view of the competition from this and other countries in the British markets. In 1876 the population of Buenos Ayres—the most important Province in the Argentine Republic—was about 600,000, and according to the latest returns, the immigration is between 60,000 and 70,000 a year. Area 440,000 square miles. There are about 45,000,000 sheep, which yield 136,000,000 pounds of unwashed wool; 5,500,000 cattle and 1,500,000 horses, or 200 sheep, 20 cattle and 6 horses for every man, woman and child in the Province. The sheep farms cover 40,000,000 acres, and there are about 30,000 shepherds—mostly Irish and Scotch. Grass is very rich and luxuriant, affording pasturage for sheep at the rate of 30,000 per square mile. Formerly the cattle were hunted down merely for their hides and tongues, the carcasses being abandoned to the wolves and vultures. Now they are slaughtered in abattoirs where every part of the animal is made available, almost as carefully as in Chicago. Except the comparatively small amount exported fresh, the meat is salted or jerked for exportation; the tallow is boiled down, and the trade in hides is great and growing. In 1872 the Province exported 203,610,000 pounds of wool; 72,970,000 pounds of sheep skin and 1,121,756 pounds of ox and cow hides.

CAUTION TO STOCK BUYERS IN LARGE MARKETS.

WITHIN the last week we have noticed announcements of outbreaks of various contagious diseases among live stock in different parts of the country—chiefly hog cholera, Texas fever and glanders—owing to the careless introduction of stock brought in large markets, like Chicago and St. Louis in the West, and Boston and Pittsburg in the East. Here is a specimen: A fortnight ago S. S. Snodgrass, a farmer of Lancaster County, Pa., "bought 96 Durham steers" (mostly grades probably) at Chicago, brought them home and sold some to his neighbors. Within the first week four of them died, a number of others were sick last Monday (when the case was reported) and several deaths had occurred among stock sold in the neighborhood. The disease is said to be splenic apoplexy. If so, it is a form of anthrax in which death is usually very sudden. The purchased cattle, we are told, are quarantined, as "the disease is very contagious." After death the flesh rapidly putrifies and becomes black, as in black-quarter or black-leg (an analogous form of blood poisoning), and is totally unfit for human food. Even dogs and hogs that have fed upon it have died within a few hours, and butchers who, in handling the animals, have been tainted in cuts or scratches on their persons, have died in great agony. The carcasses should be buried deep at once or, better, burned. Too much care cannot be taken in buying stock "promiscuously" in large markets. It frequently happens that unscrupulous owners rush their stock to such markets on the first appearance of disease among them, and it takes more or less time to become developed. Then, again, disease is sometimes contracted on the road by contagion, either from infected cars, fodder or yards in which the stock are temporarily confined. Is it ever generated by hardship and cruelty?

At the recent auction sales of Herefords in England, prices were unsatisfactorily low. On August 19, at the sale of the Bage and Shenmore herd of 70 head, founded in 1842, the highest price was 40 guineas—$204. At the Slowes Court sale of 125 head on August 22, the highest figure for a cow was 41 guineas—$209—though several others brought 30 guineas—$145. The top price for a bull was 66 guineas—$324. At the great sale of Crome Court on August 26, 100 head were offered, 1,000 guineas being the reserve price placed on Good Boy, and 150 guineas the reserve on Gold Treasure, both famous prize-winners; but no one cared to pay either figure. The best prices for cows were 50, 40, 38, 37 and 31 guineas; and for bulls, 60, 40 and 36 guineas. A number of cows and bulls were withdrawn from sale or remained unsold because of the poor prices.

AT the sale of the Burnside herd of 74 Shorthorns, on August 17, the highest-priced bull brought 168 guineas—$856.24. The highest-priced cow, Princess 10th, two-year-old, was bought, for Buenos Ayres, for 100 guineas—$511., the 74 cows and bulls averaging £33 5s. 4d.—$160.50.

SOME people think that nothing but still, cold weather will hurt stock. They make a great mistake. The cold, drizzling rains that come every Fall do more damage than the frosty weather of Winter. If cattle ever need shelter it is when these cold rains come. Remember it, farmers, if you want the cows to have any shape to them next Spring. C. E. E.

Hillsborough Co., N. H.

Dairy Husbandry.

DAIRY NOTES.

T. D. CURTIS.

INDIVIDUALITY OF ANIMALS.

THE individuality of animals is not sufficiently considered. Hence too much stress is laid upon the performance of individual cows as a test of the characteristics and value of the breed to which they belong. The fact is that there is about as much difference between the individuals of a breed as there is between the several breeds, and the individual is constantly changing with the different periods of lactation, and from year to year. This change can be seen in both the quality and quantity of product. Hence, aside from the general appearance, the characteristics and value of any breed of cows can be properly judged only by the performances of a large number of such cows under well-known natural conditions.

DIGESTIBILITY OF MILK.

It appears that the digestibility of food depends largely on the availability of the fats which it contains, and these fats must be present in due proportion. Milk is now understood to be an emulsion of fats, sugar and water with caseous and other nitrogenous materials, including some mineral ingredients. The caseous matter is held in imperfect or partial solution, and hence the white or opaque appearance of the milk. The fat exists in the milk in minute microscopic globules, not covered with a caseous or other membrane, as supposed until recently, but with the albuminous or more viscous materials naturally adhering to them. Now, digestion depends on the reduction of all the ingredients to minute particles so that they can be dissolved by the digestive fluids, and put in a condition for their absorption by the millions of little capillary ducts that line the intestinal canal, that they may thus enter into the general circulation to nourish the needy organs. Hence, the conclusions gradually being reached by some who are acknowledged as authorities, that milk which contains the smallest butter globules is the most easily digested. It appears reasonable, and it will not be surprising if full investigation shall demonstrate this to be a fact. If so, it will give additional value to the milk of some breeds that have heretofore stood in popular disfavor because of the smallness of the fat globules which it contains. It is even asserted that the butter made from cream composed of small globules of fat is more easily digested than that made from cream composed of large globules of fat—and this with all due respect for the little Jersey.

CUM GRANO SALIS.

Some very queer things are claimed for dairy salt, and that which should be generally considered a defect is sometimes commended as a desirable quality. For instance, we are told that a certain salt added a specified amount more of weight to butter, when used in equal quantity, than another kind, and this is considered favorable to the former! If the treatment is precisely the same, all that is shown is that one salt is less soluble than another, and the best butter makers have always considered that salt the best, all other things being equal, which dissolves the most readily. In cases of difference of weight caused by the use of different makes of salt, one of two things must happen—either the most soluble salt is foolishly wasted by too much working of the butter, or too much of the other salt is retained in the butter in an undissolved condition. The most soluble salt requires the least working, and is, therefore, the most desirable. With intelligent and proper management there would be no more waste of it than of the harder salt, but labor would be saved and the grain and flavor of the butter better preserved. Weight is not the most desirable quality in butter.

FALL CARE AND FEED OF COWS.

The dairyman who is most careful to furnish shelter for his cows when the cold rains and frosty nights come on, and who feeds most judiciously, never letting his cows shrink in their flow of milk unnaturally for want of food or of the proper kind and proportion, is the one who will get the most product. Such a dairyman is likely to manage well in other respects, to work his large flow of milk up to the best advantage, and to get the best prices for his goods. To say nothing of the cruelty of the act, it is bad policy to permit cows or other animals to suffer for want of food and shelter. Any loss in this way, in the Fall of the year, puts the animals in so much worse condition for wintering. The loss is not only immediate, but is felt all through the future, and imposes extra cost to restore the animals to the condition which they could have been kept in with very little more outlay than was incurred.

COMMON SENSE IN THE DAIRY.

Some dairymen are so short-sighted as to make very wasteful mistakes in feeding their herds. A common one—not so common now as it was once—is to feed all the coarse fodder the first thing in the late Fall and early Winter for the purpose of having the finest and best left for subsequent feeding. By this practice, the cows not only fail to get a proper variety of food all through the season of foddering, but are compelled to gorge themselves with the coarse fodder in order to secure nutriment enough, if they do not reach a state of satiety and refuse to eat. The subsequent feeding on the better fodder may not be so objectionable, but fails in point of variety. Common sense dictates that the coarse and fine fodder be fed together, the one complementing the other and providing a much better balanced ration. The fodderings may be alternated. By this method the coarse fodder will be eaten up more closely, and both will go further than they would if fed separately. Thus combined, the cows will relish their food much better, will keep in a more thriving condition, and if in milk, yield a larger and better product.

SUCCULENT FOOD FOR COWS.

Provide somewhat of succulent food for your cows when the pastures fail and they must depend on fodder. Some dry feed during the Summer when the grasses are so very juicy, is equally desirable. It is easy enough to furnish the latter in the form of hay. Succulent food may be silage or roots. The food may be drier during the cold weather than would be beneficial in Summer. But in Winter, we ought to aim to furnish food not much less succulent than fall grasses. It is better for the cow and for the product.

"RICH IN CASEINE."

WHAT does a certain kind of dairy writers and breeders of dairy cattle mean by the term "caseine richness" in the milk of certain breeds, by some called the "cheese cows?" That there is a certain per cent. more of butter-fat incorporated or held in natural emulsion in the caseine part of the milk of such breeds, that the best cream extracting processes will not take out, than there is in the milk of the common, or the specific butter-breeds, or what do they mean? That there is a greater per cent. of pure caseine, as compared with the fat, than in milk that will yield more pounds of butter per 100 pounds of milk? If the first, can it be shown that caseine, as chemically analyzed from two breeds differs in quality or "richness?" If the second, then is there any escape from the conclusion that the greater per cent. of caseine there is in a cheese, as compared with the butter-fat coagulated and incorporated with it, so much the more does the curd take on the character of skim cheese? "Richness" in cheese comes only from butter fat. Where does richness in caseine come from, we meekly inquire? It is as absurd, in my opinion, to talk about richness in caseine, as it would be to talk about the saccharine properties of lemon juice. The breeder who commends a cow for "caseine richness" in her milk, is either stupendously ignorant, or trying to prey on the ignorance of his victim. The term is as absurd as oleaginous potash. Let farmers know this—that a cow especially commended as a cheese cow because she can't show up in butter, is a skim-cheese cow, and really can't show up in either cheese or butter. BADGER.

Sheep Husbandry.

Notes from the Western New York Farm.

WINTERING LAMBS.

THE REQUISITES OF SUCCESS.

IT must not be forgotten that, no matter what the temperature to which an animal is exposed, its bodily heat must be maintained at 98°, or else it suffers in health; and digestion, in common with the other functions, becomes impaired and only loss can ensue; and that this temperature, when no artificial heat is used, is kept up solely by the combustion of a portion of the food. It follows, then, that in the too common way of wintering lambs in the open field or yards, a very large proportion of the food is thus consumed, and so far as any returns to the owner, it might just as well have been burned in a heap. Now, if the lambs were so housed in warm quarters that the consumption of food necessary to keep them warm was reduced one-half, the other half would go to add to the growth, and as the quarters once built will last many years, the amount chargeable to the lambs would be only the sum of interest and repairs. It will pay to build stables just for the saving in this direction.

In the wintering of lambs, as in the keeping of other stock, a certain amount of food is required beyond that necessary to maintain heat in supplying the waste of tissue in sustaining life (in running the machine), and if no more be fed than what is necessary to supply this waste, the only possible profit could be in an increased value in Spring over Fall; but, as has been shown, a shorn yearling, if in only store condition, is worth less than the lamb in the previous Fall, so that he who winters in the old way has to work against this decline. But when so fed as to become fat and in demand for slaughter, the spring price, even without the fleece, will be about the full value of the added weight. If the quarters in which the lamb is are of the best construction, the gain in weight will be in proportion to the food consumed, providing such food is selected and proportioned so as to be most conducive to growth; but it must not be forgotten that lambs require very different food from full-grown sheep. In the lambs there will be a large proportionate increase of bone and muscle, as well as of fat and wool, and our ration must be suited to the growth of each and all. After much experience, I have found a mixture containing 100 pounds of corn, 50 pounds of bran and 50 pounds of new-process oil meal as near the thing as any I have tried. Of this, beginning with a small quantity and gradually increasing until they receive all they will eat, the average amount eaten by each per day will not be far from one pound, or 180 pounds for the Winter. In this ration the bran furnishes a surplus of the phosphates for the bones, the oil meal, of the nitrogenous matter for the muscles and wool, and the corn, of the fats and carbohydrates for sustaining heat and furnishing fat, while the combination of hay and mangels, and the straw, which should be given daily, furnishes a very well-balanced food. If the old-process meal is used, the proportion must be greatly reduced, or the proportion of free oil will be in excess of the ability of the stomach to digest, and its effect will be medicinal and harmful, and for the reason that I can buy the carbohydrates much cheaper in the corn than in the oil meal, I greatly prefer the new-process meal with its less free oil and much larger proportion of albuminous matter.

The cost of material for the above mixture will, at last year's prices, be as follows: 100 pounds of corn, 80 cents; 50 pounds of oil meal, 56 cents, and 50 pounds of bran, 30 cents, or $1.66 for 200 pounds, or 83 cents per hundred, or for the 180 pounds eaten for the Winter, about $1.50. But in addition to the grain, hay and straw ration, to do its best the lamb must have a daily feed of some green food. I use mangels, and feed one-half bushel to 20 lambs, which would require 4½ bushels for each lamb during the Winter, costing not over 32 cents.

When sold, our account against the lamb will stand about as follows:

60 pounds lamb at 4 cents	$2.40
Six months' interest	.07
Rent of barn room	.08
325 pounds hay at $8 per ton	1.40
180 pounds of feed	1.50
4½ bushels mangels	.32
Aggregate	$5.77

To its credit there will be seven pounds of washed lamb's wool, worth, even at last Winter's very low prices, $1.40; 95 pounds of fat lamb, 5½ cents, $5.25; making an aggregate of $6.625, and leaving a net profit of 85⅛ cents per head, and adding the value of the manure (which is richly worth one-half the cost of the dry food, and one-eighth of that of the mangels, or $1.49), the profit will be $2.34⅓ per head. It will be noticed that in neither case have I made any account of the straw fed the lambs. I have taken this course because the straw on most farms is a waste product, and must in some way be used up and returned to the fields, or else be burned up, as is the idiotic way of thousands of Western farmers; or, worse yet, allowed to rot down in a pile to become a breeding place of weeds and a scourge to the farm. Neither have I made any account of the labor in caring for the lambs, for the reason that almost every farmer has the help to care for his stock, and unless a business is made of winter feeding, very little extra help will be needed and this will be very little more in the one case than in the other, and if charged in both would make the showing very much more unfavorable to the old way. Another thing which I have done is very unfair to the new way—I have conceded that, when highly grained, each lamb would eat as much hay as when fed hay and straw alone, and this is not true, as they will eat fully twice as much straw and one-third less hay. But with all the unfairness, and construing everything as unfavorable for the highly fed and as favorable for the others as any one dare claim, still every reasoning man must see that the sooner the old way is abandoned and the new adopted, the better for the sheep keeper and the more money he will have.

I am asked by several if the indications are favorable for a profitable feeding season. The indications are always favorable to the feeder who takes good care both of his stock and the manure he makes. There is not an acre of land in any of the older States, and I doubt if there is in any of the States east of the Mississippi River, that would not be better if manured, and when we count the value of the manure properly used, there is always a profit in feeding. But for this particular year, let us see: Sheep and lambs are higher by about one-half cent per pound than one year ago; grain and hay are not very much different. On the other hand, wool has advanced at least 25 per cent., is strong at the advance, and promises to advance still more. There is a large decrease in the number of sheep and a scarcity of feed on the Western ranges, so that while many sheep will be rushed East during the Fall and early Winter, I am of the opinion that good prices will be realized for good sheep in the Spring.

This has been the driest Summer I have ever seen. Since June 14, we have had only two rains—August 17 and 24th—that wet down to moisten earth even in plowed and cultivated land. Yesterday morning—September 12th—we had the first shower that laid the dust since August 24th. Wheat sowing is greatly delayed, and late potatoes and corn are suffering. Yet on land that was well manured last Winter and that has been thoroughly cultivated, corn and potatoes will be fair crops.

There is great danger that in such a dry Fall and with poor pastures, the sheep will be allowed to fall off in flesh. This is a grave mistake, and a fatal one with last Spring's lambs. A few hundred pounds of bran a few bushels of corn fed now, a little daily, will save many dollars' worth of feed in Winter, and, likely, quite a number of lambs also. Try it!

Orchards are bare of apples. This County will produce fewer barrels than in any other year since 1859—the year of the June frost. Besides this, the trees are looking badly in all orchards not well manured. There is no mistake but that fruit trees need manuring as much as any other crop, and the quicker fruit growers realize it the more money they will make. J. S. WOODWARD.

TAKE GOOD CARE OF THE RAM.

MANY farmers who keep a few sheep treat the rams in an absolutely barbarous manner. He must be treated better if any vitality is expected from him. Too many farmers look upon the ram as a sort of necessary evil. They have to keep him in order to get the ewes with lamb, but that is about all he is good for, many of them think. The fact is that the ram is half the flock. The value of the lambs depends greatly upon him, and he should be well treated. Two weeks before the time for service he should have extra feed and at all times he should be kept out of storms and bad weather. Before turning him with the ewes smear his breast with paint. When he serves a ewe catch her and put her in a separate yard. After he has served three or

four, put him back into his own place. Keep this up till he has served all the ewes, and then let him run with the flock for two weeks to serve any that may have failed. This makes extra trouble, but it pays well. Some of the neighbors will laugh in the Fall, but they will keep remarkably quiet in the Spring. Your lambs will be jumping up to take their rations without assistance. When you see your neighbor hastening to the house with a lamb under each arm and upsetting the pantry for a nursing bottle with which to brace up weak lambs, you will have your turn at laughing. A poor half-cared for and overworked ram will cause weak and spindling lambs. Don't forget it.

Washtenaw Co., Mich. W. F. B.

ANGORA GOATS.

THE American Mohair Growers' Association, organized at Fort Worth, Texas, last February, will hold its first annual meeting at San Antonio, Texas, Monday, October 4, next. The establishment of an Angora Goat Breeders' Register is to be considered.

Angora goats were introduced into California in 1848, and goat raising has attained the greatest development there. For the production of flocks, they have usually been bred on the common goat, as the Merinos have been crossed on the coarse-wooled Mexican sheep. There is a considerable demand for mohair; but the industry here is in an experimental stage, and has varying fortunes. An establishment in California for making robes, mats, gloves and whip lashes often uses 30,000 goat skins in a year—half-bred or high-bred Angoras. Considerable interest is taken in Nevada in raising Angoras for meat, skin and wool, and there are several large flocks in the Territory. They are, as a rule, the offsprings of common goats with bucks from California. We have an account of a flock of 2,912 head, consisting of 1,800 ewes, valued at $2.25 per head; 600 wethers, $2.75 per head; 500 kids, $2.25 per head; and 12 bucks, $16.50 per head. Though Texas has started the Association, the Angora goat business there is of later introduction; but it is developing rapidly. There are a number of flocks now of 1,000 head each, but there as elsewhere, the business is very fluctuating. There are also some considerable flocks in the Carolinas, Georgia, Kentucky, Tennessee, and Arizona, and smaller "bunches" in other States.

The present prices of mohair in this market range as follows: choice, 55 cents; superior, 45 cents; fair, 42 cents; ordinary, 40 cents; inferior, from 30 to 35 cents. At the Cape of Good Hope, where Angora keeping is an extensive industry, the animals are clipped twice a year; but in in this country, they are shorn only once—early in the Spring. A flock of Angora wethers from two to six years old, if kept fat the year round, would yield fleeces of five to six pounds; but breeding ewes would not give over four pounds.

Horseman.

CLEAN THE HORSE'S SKIN.

IT is not enough that the groom should merely clean off the dry deposits that remain from the sweating process through which the horse may have gone. This, it is true, removes the apparent foulness, but it is far from meeting the work that comes under the head of "grooming." There is no way in which one can do the horse more real service in the way of keeping him healthy, than by washing his skin with water as hot as the hand will bear. Whether this is done immediately after a drive when the horse is perspiring freely, or when at rest and the skin is perfectly dry, a large blanket should be provided to cover the animal and keep it covered during the process of washing, keeping it on the shoulders while washing the hind-quarters, and *vice versa*.

Provide yourself with a large sponge and a piece of good soap, or, instead of this, an ounce of aqua ammonia. Put this into a quart of water if it be of the highest strength, and into a pint if it be of low grade, and after moistening the hair and skin with the hot water, with a small sponge rub the surface over with the ammonia water, seeing to it that it reaches the skin. Then wash the hide and hair thoroughly, scraping the water out of the hair with a wooden or other scraper having a thin, smooth edge. Rub dry with a woolen cloth and cover with a dry blanket, keeping the horse out of a current of air, if this be cold. Be especially careful if the horse is exhausted by having had a hard drive.

Merely cleaning the dried sweat from the hair of a horse is a small item in the process of thorough grooming and cleaning. It should be remembered that it is the skin, and not the hair that carries on the process of eliminating such secretions as the body requires relief from: that is, such as escape through the pores of the skin. The intestinal tract and the kidneys and bladder present but a limited surface for the elimination of refuse from the body, as compared with the skin, yet, when a horse gets sick how ready men are to say, "give him a physic"—salts or aloes or "give him a diuretic"—niter or pumpkin seed tea. An ounce of prevention is, as often stated, worth a pound of cure, and if, in conjunction with care in feeding—feeding enough and not too much, and of the right kind—that portion of the duties of the stable that comes under the head of grooming be carried out as here indicated, we would not so frequently as now need the internal agents referred to.

WESTERN.

HORSE JOTTINGS.

WHILE we are importing every year great numbers of draft horses and an occasional Thoroughbred from Great Britain, couldn't we secure the balance of the trade in our favor by exporting more horses than we do? England imports annually 20,000 horses; at present most of these come from Ireland. In spite of the excellent native breeds—Clydesdale, Shire and Suffolk—many draft horses—Normans or Percherons—are imported from France, besides some lighter horses for other purposes—some of them for the army. There's an English Commission now in Canada inquiring into the adaptability of colonial-bred horses for cavalry remounts; it wouldn't be a bad idea for the members, even for curiosity's sake, to visit Illinois and Kentucky, where they would see thousands of animals excellently adapted for cavalry or artillery purposes.

August is a favorite month for shipping live stock, as the weather is likely to be unusually favorable. The last week in the month there was a brisk trade in Clydesdale horses north of the Tweed. Half a dozen pedigree Clydes were shipped from Liverpool for Peter Blundell, Washington, Ill. Two were shipped to George Murray, Polo, Ill. Four went to Mr. Snaggs, Brantford, Ontario, Can. One of the largest shipments of the season, 44 head, left Glasgow for Norris & Clark, Lamoille, Ill. Of the lot 31 were pedigreed stallions, between four and five years old, reported to be an excellent lot. Over 760 pedigreed Clydes have been exported since the opening of the year,—the largest figure yet reached. Powell Brothers, Springboro, Pa., have made two large shipments, one in August. Clydes seem to stand ocean travel exceptionally well, nearly 300 having been landed in Montreal in August with the loss of only one animal, which was sickly when embarked.

The Swineherd.

PIG CONSIDERATION.

COL. F. D. CURTIS.

Sows eating their pigs; habit due to an unhealthy condition; predisposing causes; prevention; treatment of a sow in slow or unnatural parturition.

THERE is always trouble with sows eating their pigs in the Winter and early Spring, and very little trouble when the sows are out on the ground, or have plenty of succulent food. I have never had any trouble in Summer. The past Spring there was more complaint than usual on account, I suppose, of the cheapness of corn. It was fed bountifully because cheap and handy, and it made more fever amongst sows, and so more of them were inclined to eat their pigs. The best remedy for this kind of trouble is care and consideration beforehand. Light and laxative foods should be given up to the time of pigging and afterwards, because the best to cool the blood and keep the whole system in good order. A sow never kills and eats her pigs when in her right mind. The evil is always due to an unnatural condition of body and mind. In other words, a sow to do such things is crazy or frenzied and ferocious with pain or fright. There are various reasons for this excited condition. Fever, constipation, fright, hunger and thirst will produce it. The most natural cause is the pain of parturition. A weak, squealing pig often excites the sow and makes her wild. When such is the case the pig should be taken out of the pen and kept out. If a sow shows excitement when disturbed, she should have food put within her reach and be left alone. When a sow strikes her jaws together in an angry manner, she must not be disturbed. Some sows are much more sensitive than others. A good dose of raw linseed oil would be good to give a sow whose feces show dryness or constipation. A bountiful feeding of thin slop would fill the stomach and allay hunger and thirst.

Unnatural parturition is one cause of frenzy. I lately had a case of this kind. In the morning a favorite sow was found to have had pigs all of which were dry, showing that they had been born some little time. As soon as I approached the pen, the sow got up and was uneasy and went tramping around the inclosure. Fearing she would step on the pigs, I got into the pen and picked them all up and put them into a basket and took them out. She did not appear in the least disturbed. She was given a little drink, after which she lay down and was soon up again. She thrashed around, all day growing more and more uneasy without passing anything. After dinner an effort was made, in the most quiet way, to give the pigs to her. The instant she heard them she sprang up and would have killed them had she been given a chance. The pigs were taken to another sow, and her own were kept away, while the little strangers got some suck. Just before night, the sow, having been in great pain all day, a rope was put over her snout at the end of a fork and she was secured and thrown upon her back. She fought and struggled, and in the struggle a fine pig was born. Her hind and fore legs were each bound together with a strap, and then made fast to staples in the floor. The rope on her snout was tied so that she could not throw her head around. A board was nailed down across the pen and fitted down closely to her shoulder and another to the ham. These boards did not touch her belly but they prevented the least struggling and made it impossible for her to get up. The pigs were now put to her breasts which were leaking the milk, and she was left until the next forenoon undisturbed. At this time no more pigs had been born and the placenta was discharged, and the sow was taking to her pigs. She was now released and and everthing was all right. She had gotten over the pain caused by her not being able to give birth to the pig. I shall always confine a frenzied sow the same way, and when one is not able to have her pig it would be a good plan to turn her for a few minutes on her back to cause the unborn pig to change its position and so relieve the mother, or to raise her up behind and let her walk on her fore feet. This will change the position of the young and work a natural presentation.

HOG CHOLERA QUESTIONS.

DR. F. S. BILLINGS, of the University of Nebraska, to which the State Agricultural College is an adjunct, has been appointed to investigate hog cholera in that State, and asks the farmers to send to him, at the University at Lincoln, information as to the number of hogs they raised last year; was any hog cholera among them; their market value at death; the breed of the diseased animals; whether any breeds are more liable to the disease than others; are "scrubs" more susceptible than pure-breds; when is the loss the greatest; what effect has the weather on outbreaks, especially as to severity; are outbreaks earlier on high dry land than in low wet places; how did it get into the herd; does the term indicate one or more diseases; if more, why; was the herd affected in 1884; were the hogs kept in the same place both years; has sex or age any influence for or against the disease; will hogs that have had the disease have it again next year, if allowed to live. These are suggestive queries to hog owners in all parts of the country where hog cholera is ever prevalent; and where is it not? What do our readers think of them?

The Poultry Yard.

KILL THE LICE.

THE hen houses must be cleaned out during September if the hens are to be kept through the Winter. They are fairly alive with lice now. No wonder the hens want to roost in the trees. It is unfortunate in some respects that more human beings cannot be made to endure the torture from these creeping horrors. They would be far more merciful to their stock if their flesh could honestly creep at the memory of these filthy vermin. Lumbermen, war prisoners, and others who are forced to live in lice-infected places, all say that nothing so tends to destroy health and comfort as lice. No more horrible punishment would be possible than to force a man to live in a lousy room. Constant torture, sleeplessness, insanity, death would be the result. What right has man to inflict this dreadful punishment upon the dumb animals that are placed in his charge? He has no right; he transgresses both a human and a moral law when he neglects to destroy the vermin on his cattle or turns the hens into a lousy house for the Winter. We say stop *now* and clean out the hen-house, or else kill every hen on the place before cold weather sets in. Take a hoe and a shovel and clean out every ounce of manure. Take water as hot as you can get it, and with an old broom or mop swab out every crack and corner of the place. Burn up the old nests. Spray kerosene into the cracks and edges. Put two good coats of whitewash all over the inside. Take out the perches, scrape them off and pour kerosene along them. It will pay to dig out the earth at the bottom of the house and put fresh dirt back. Put in pure sand, if you can get it. Don't neglect this now. It is a combination of business and morality. You will get more eggs to pay for it, and your conscience will be lighter.

POULTRYMAN.

A GOOD CHICKEN COOP.

I HAVE found the coop shown at Fig. 373 indispensable in raising chickens where rats and minks abound. It is 14 feet long, 4 feet wide, 5 feet high at the back and 3½ feet high in front, and is divided into four parts. The roof is shingled and a space two inches wide is left at the highest point of the roof over which are placed two fence boards,

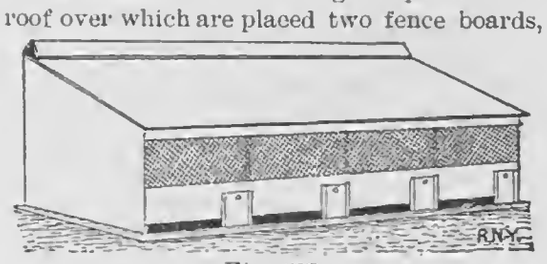

Fig. 373.

nailed together at right angles, to shed the rain. This forms a ventilator. A door opens into each part to facilitate cleaning. The front, which should face south, has a board nailed under the eaves and one two inches above the bottom and between these is 1½-inch mesh wire screen. Exits are sawed out for the hens. At the left of each exit are long, narrow places for chicks to run out, which are closed at night with heavy scantling, or boards kept in place by stakes at each end. The exits are closed with boards to fit. Boards about three inches wide are placed on a level with the earth entirely around the coop to prevent the hens from scratching under. The coop makes an excellent roosting place for "weaned" chicks; 50 nearly grown may be accommodated till placed in winter-quarters. My single coops are all constructed on this plan. Without some such convenience I presume I could not raise 20 per cent. of my chicks on account of common rats and minks.

Farm Topics.

CORRESPONDENTS' VIEWS.

PEOPLE in this country need to take an education on the subject of stoves. During the rainy season we sit shivering around open fire-places. There is only one side of us—the one nearest the fire—that can be kept comfortable. These big fire-places should all be closed up and stoves put in their place. Nobody knows how the health and comfort of our people would be improved if such a change could be made. Most of the folks here have their wood-piles right out in the weather. They cut up a few sticks at a time as needed. We are using more coal now, but most of that stands right out in the rain. We need wood-sheds and stoves here the worst kind.

Lowndes Co., Miss. A. K. W.

THE best way to reach the hearts of children—and some men—is through their stomachs. Some people save all the eggs, butter and chickens to sell, and live on pork and beans from January 1 to December 31. They think the little bank account that comes from this saving is a big thing. They would make more in the end to sell the pork and beans and have chicken three days out of seven. The children will be healthier and better satisfied to stay on the farm. It is a good thing to remember every birthday by roasting the fattest goose or turkey on the place. Let all the birthdays from father's down to the baby's be remembered in this way. Associate happiness with a good dinner if you want your children to be home folks.

K. C.

Peoria, Ill.

How do you eat grapes? It seems to me that most people only half eat them. They just pull off the skin and swallow the pulp and seeds whole. I claim that in this way they don't half eat grapes. There is no more reason why we should swallow the seeds of grapes than the pits of cherries. These seeds are said to act upon the kidneys and that a few of them will do no harm. I am satisfied that where grapes are eaten in large quantities the seeds may prove very harmful. It is with eating grapes as it is with eating bread and butter; most people eat it so that the butter comes against the roof of the mouth, when to get the best taste it should be put against the tongue.

H. C.

Bergen Co., N.J.

FOR a long time I have advocated a plan

for helping the temperance cause which seems to me to be practical. I would make every saloon keeper responsible for whatever damage was caused by the liquor he sold. Suppose a man got drunk and destroyed property. The man who sold him the liquor would have to pay for it. Suppose he committed some crime for which he was sent to prison. The liquor dealer has to support the prisoner's family. In every case, as I think rightly, the damage is attributed directly to the liquor, rather than to the man. The man who supplies liquor to the customer is as much responsible as the man who applies fire to a building. Such a law could be passed where a prohibitory law never could be. It would destroy the argument of thousands of men who say that the Government has no right to say what they shall drink so long as they do not disturb the peace. Rum-sellers would be very careful to whom they sold liquor if they knew that they would be held responsible for the effect of their cursed stuff. The business would soon lose its profit, and we might hear of a rum-seller failing—something I have never heard of yet. Such a law could be enforced more completely than any strictly prohibitory law could. J. B. R.

Essex Co., N. J.

We have a bad piece of road in our town. It was originally a "cross way" road built of logs and plank through a swamp. The logs rotted and bad holes formed. The swamp has been drained and many loads of gravel have been placed on the road. Still it was a regular slough in Winter. Two years ago we made a hard pull to get it into shape. The owner of a brick yard near by gave us a big pile of broken brick. We all turned out with teams and dumped that brick along the worst places and put gravel on top of it. After it worked down it made a fine road for a time, but now the old logs are beginning to work up. We can cover them with gravel I suppose, but I do not think the road will be what we want it to be until we dig the old logs up and start on a new foundation.

Hillsdale Co., Mich. B. H. S.

My idea is that fruit growers who want better prices should pay more attention to the temperance reform. The people in our towns and cities who have little money are the ones who ought to buy more fruit, and they would do it if their money didn't go for drink. Plug up the saloons, and we shall open a new market for our fruits. It is a matter of business, fruitmen. The less liquor sold, the more fruit bought. H. C. B.

Summit Co., Ohio.

NIGHT SOIL AS MANURE.

Some 20 years ago we hauled night-soil from a town over three very hilly miles. We put it in water-tight barrels sunk in the ground and added water from time to time. In a week or 10 days in warm weather it would foam and rise. In this state, with the addition of a little water, it could be carried in pails and put around the hills. The good effect was evident in a few days. When the solids were mixed with ashes and spread on the surface, or spread unmixed, the effect was more lasting We were paid for carting the night soil away. It paid us well, for our place was poor enough, and by means of this manure we brought it into a high state of fertility. We were glad to give the business up though after we were fairly started on the farm. It is the dirtiest of all work, and it gives one a reputation that will hang to him for years. Still, I must say that a man with a poor farm and no money with which to buy manures, cannot do better than to collect all the night soil he can find. E. F. E.

Brandon, Vt.

CHEMICAL FERTILIZERS ENOUGH.

I have a little place of 10 acres, all tillage, on a hillside. I am eight miles from any good place to buy stable manure. I keep no stock, and in fact, have no barn. For manures, I depend upon chemical fertilizers and green crops plowed under. I raise vegetables, fruit and hay. With these crops I can support my family and pay for the place. Some people think farming or gardening cannot be run successfully without stock. They keep dairy stock on a small place, often at a loss, rather than say they keep none. My experience satisfies me that I can raise an abundance of fruits and vegetables on chemical fertilizers, and supply the needful vegetable matter by plowing under an occasional crop of rye, buckwheat or sowed corn. A. W. B.

Middlesex Co., Mass.

HANDLING POTATOES.

Every person who raises many potatoes should have a number of square boxes holding about a bushel each. These can be placed along the rows and filled from the ground. They should be placed in the wagon and not emptied until the barn or cellar is reached. Most farmers handle their potatoes over three or four times in passing from the ground to the bin. Why handle them unnecessarily? What must we think of a farmer who has to mow down the weeds on his patch in order to find his potatoes. T. N.

Belmont Co., Ohio.

COOKING FOOD FOR STOCK.

I notice that most of the Experiment Stations report that it does not pay to cook food for stock. It may not for cows, but I am certain it does for hogs. I have an idea most of these tests we hear about were made in Winter, and that the cooked feed froze. It pays to cook the small potatoes anyway, and to my mind all meal fed to the hens is far better cooked.

Bucks Co., Pa. W. H. L.

[All agree that it pays to cook potatoes for stock feed, owing to the indigestibility of the starch granules in an uncooked and unbroken state. When potatoes are boiled these starch granules swell and burst, as seen in heated pop-corn. The starch is then digestible. The season at which the tests have been made is always mentioned and all other conditions which affect the cases.—Eds.]

Rural Topics.

Experiment Grounds of the Rural New-Yorker.

LATTER-DAY RASPBERRIES.

Have we made much real progress in improving the raspberry of late years? Let us see.

The Cuthbert is a hardy plant. Its fruit is of an acceptable color, firm enough for market—good enough for home use. As a late variety, it has no equal in many parts of the country. It is one of the few raspberries that, prospering over a wide extent of country and under varied conditions of soil and climate, has not disappointed those who were induced to cultivate it by the high claims made when it was introduced.

The Superb is not a success. The plant is vigorous, hardy and productive enough—the berries are large. But they crumble too much for market purposes, while the quality will never commend them to those who appreciate a good raspberry.

The Marlboro was paraded before the public in a grand way, and the Rural tooted at the head of the the brass band as loudly as anyone. Judging it by the branches loaded with large berries taken to the office as well as by the fruitage and growth of two fine plants carefully set at the Rural Grounds by the originator himself, we though we were safe in concluding it would succeed generally as well as in the grounds of its birth, where it seemed almost faultless. But several years of trial since show that while the berry is larger and firmer than the average, the plant is not vigorous enough ever to become a general favorite except under congenial conditions to be found only here and there.

Shaffer's (Colossal), which was introduced less ostentatiously, is everywhere gaining friends. It can never become valuable as an "all-purpose" berry on account of its dark color. Neither is the quality of the best; it is too acid. Yet the acidity is of the rich not of the sour order, which with the great size of the berry places it among the best kinds for canning purposes.

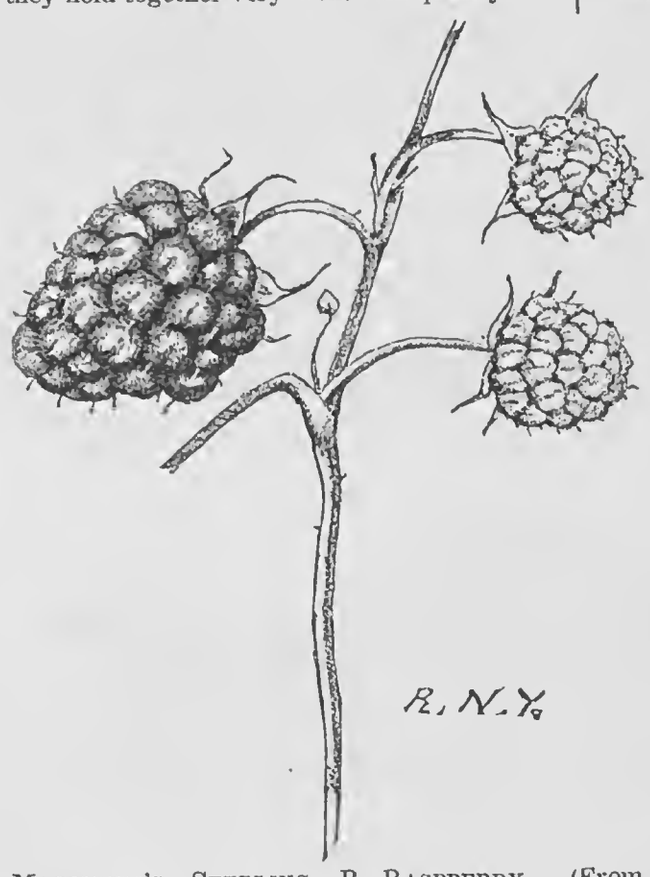
The Hansell is the earliest raspberry we have, and in this and in the firmness and lively color of the berry rests its chief value. The berry is inferior in quality, and the plant in vigor. The Ranecas differs from the Hansell in being not quite so early and a trifle more vigorous or, shall we say, less feeble.

Crimson Beauty was introduced by A. M. Purdy of Palmyra N. Y. Several different varieties have been tested here under this name, none of which seem to be any decided improvement over old kinds. It ripens with Marlboro and is better in quality, though not so large and firm. There are many imperfect berries.

Reliance was sent to us by C. A. Green, of Clifton N. Y. The plants are hardy, productive; the berry is much like the Philadelphia.

Christine is a late berry, large conical, firm and of good quality. It was sent to us by Rev. E. P. Roe. It will thrive probably where the Antwerp thrives. It is not hardy here oftener than one year in three.

Seedling B, shown at Fig. 367, was received from L. M. Macomber, of North Ferrisburg, Vermont, in May, 1885. It is thought to be a seedling of Belle de Fontenay which it resembles in cane and leaf. The berry is bright red when ripe, darkening in color afterwards. Some of the berries were as large as any we have ever raised. The drupelets are very large, as shown in the illustration, though they hold together very well. In quality we



Macomber's Seedling B Raspberry. (From Nature.) Fig. 367.

know of no better berry. It has all of the sweetness, richness, sprightliness and raspberry aroma that can be desired. The plant is strong-growing and bears continuously for a long time, though whether it produces a fall crop we cannot as yet say. The canes are nearly thornless. It is too soon to judge of this fine berry as to productiveness and hardiness. We merely record the impressions of a single season.

Meredith Queen, from E. J. Brownell, does not thrive very well here. The berries are of medium size, late, extremely juicy and too soft for carriage.

YELLOW RASPBERRIES.

The Golden Queen has recently been illustrated and described in these columns. Our plants have not yet borne. It promises to be the best all-purpose yellow berry yet introduced.

Caroline is hardy and vigorous and productive. The berries are of medium size, not very firm, juicy, but rather sour.

Ripening with Caroline is Macomber's Seedling of the Antwerp, planted in May of 1885. It is hardier than its parent, more productive and of better quality. The berries are nearly white in color, very large, juicy and rich, with very small seeds. It is too soft for shipment, but a gem for home use. The plants are vigorous and bear a long time. We cannot as yet fairly judge of its hardiness.

THE NEW GRAPE JESSICA.

One vine was received of this in the Fall of '83 from J. T. Lovett, of Little Silver, New Jersey. It fruits with us this season for the first. The vine is hardy though not vigorous, the canes short-jointed, the leaves small and somewhat liable to mildew. The bunch is much the size of the Delaware, the berries rather larger, light green, half-transparent. The skin firm. In quality it is juicy, pure-flavored, sweet with about as much pulp as the Delaware, and three-seeded. It is the earliest white grape ever raised here, and as early as any variety, whatever the color. Mr. Lovett says that it succeeds only in districts favorable to grape culture. Good accounts of the Jessica have reached us from Canada, where, we believe, it originated.

Elvira was received from Jacob Rommel, of Morrison, Mo., in May of 1883. It bore a fair crop last year and is now loaded with bunches, which, though rather small in size, bear a goodly number of berries, as they are closely crowded together. Ordinarily each bearing shoot though averaging but a foot or less in length, carries four bunches. This little vine which is but three feet high, with four main canes from eight to 10 feet long, bears 125 bunches, not a berry of which has either cracked or rotted. The Elvira is a white seedling of the Taylor. It ripens this year Sept. 8, or about with Concord, though it is said to ripen later. The berry is of medium size with thin skin which, though quite firm, cracked considerably last season. The berry is pure in flavor, sprightly and juicy—pulp rather tender. The vine is perfectly healthy.

Transparent (Rommel) was planted at the same time. The berry is small, white, transparent, sweet, with very little pulp. The bunches are small and there are many imperfect berries. The vines are healthy, though slender in growth.

Pearl (Rommel) is late rhere than Concord, though claimed to be nearly as early as Hartford. The berries are light green, not shouldered, crowded in the bunch, three-seeded round. The skin is thin with some bloom; pulp tender, juicy and well flavored. The vine is productive and healthy.

Faith (Rommel) ripened September 5. Skin thin but firm; two-seeded, yellowish green, sweet, pure. Berry small, round; the bunch imperfect and of medium size. Vine very productive, healthy.

Pomological.

NOTES IN THE ORCHARD.

T. H. HOSKINS, M.D.

RUSSIAN APPLES IN GENERAL.

I have fully 100 varieties of Russian apples growing in my grounds, many of the trees being 16 and 18 years planted, while some, of the later importations, are small. One thing is fully demonstrated, viz., that these apples are, as a class, very much hardier against adverse climatic influences, and especially against Winter's cold, than those previously grown on this continent. This alone gives them enormous value for the "Cold North," where, without them, tree-fruit culture would be impossible. In productiveness, and size and beauty of fruit, the Russian apples are, on the average, more than a match for those of Western Europe, and for our native seedlings thence derived. The disputed question in regard to them is as to their quality as dessert fruit. I say "disputed," but it is now disputed only by those who have only a very limited acquaintance with this class of fruit. People who judge them in this respect by the Dutchess of Oldenburg, Alexander and Red Astrachan, while admitting their beauty and prolificacy, undertake to denounce the whole race of Russian apples as "useful only for cooking." So earnest and continuous has been this outcry, on such manifestly insufficient grounds, that it would seem as if something more than a general interest in fruit culture were back of it. However that may be, those who have an extensive acquaintance with Russian apples know that there is among them quite as large a proportion which deserve to rank as of dessert quality as there is among the common sorts. True it is that but few of these finer sorts have yet been much distributed, but they are known, and as soon as the public becomes acquainted with them this unjust stigma attached to Russian apples will be effaced. Among these fine dessert apples the Yellow Transparent, Grand Sultan, Switzer, Charlottenthaler, Berkoff, St. Peter, Longfield, Golden White, Heidorn's(?) Streaked Red, Summer Calville, Noble Redstreak, Russian Gravenstein, Red Anis, Titovka, White Russet, and several others have now been sufficiently tested to establish the fact of their excellent eating quality, joined, in most of them, with great beauty of form and color.

RUSSIAN PEARS.

From my experience, so far, with some dozen varieties of Russian pears, while most of them seem to be hardier than our hardiest American and West European kinds, I fear few or none of them are really iron-clad. Most of them are vigorous, upright growers, with firm, glossy foliage, almost or quite free from attacks of fungus and of insects. They make an early, determinate growth, yet hold their foliage late, and though the new wood of nearly or quite all of them is discolored by a temperature of 25 or 30 degrees below zero, growth starts stongly from the terminal buds, and so far as outward appearances are concerned, they are uninjured. A number of my trees are now seven or eight feet high, and as they are well above the snow line they must soon show whether our northern Winters are too much for them. I think their healthy foliage is much in their favor, as it ensures well ripened wood. I would suggest to fruit-growers south of the iron-clad region the wisdom of planting a few of the best Russian pears among their other pear trees, and the growing of seedlings from the former. If in this way the thick, vigorous foliage (somewhat similar to that of Le Conte and Kieffer, yet different) can be secured, with good quality and other meritorious points of fruit, a valuable improvement would be secured.

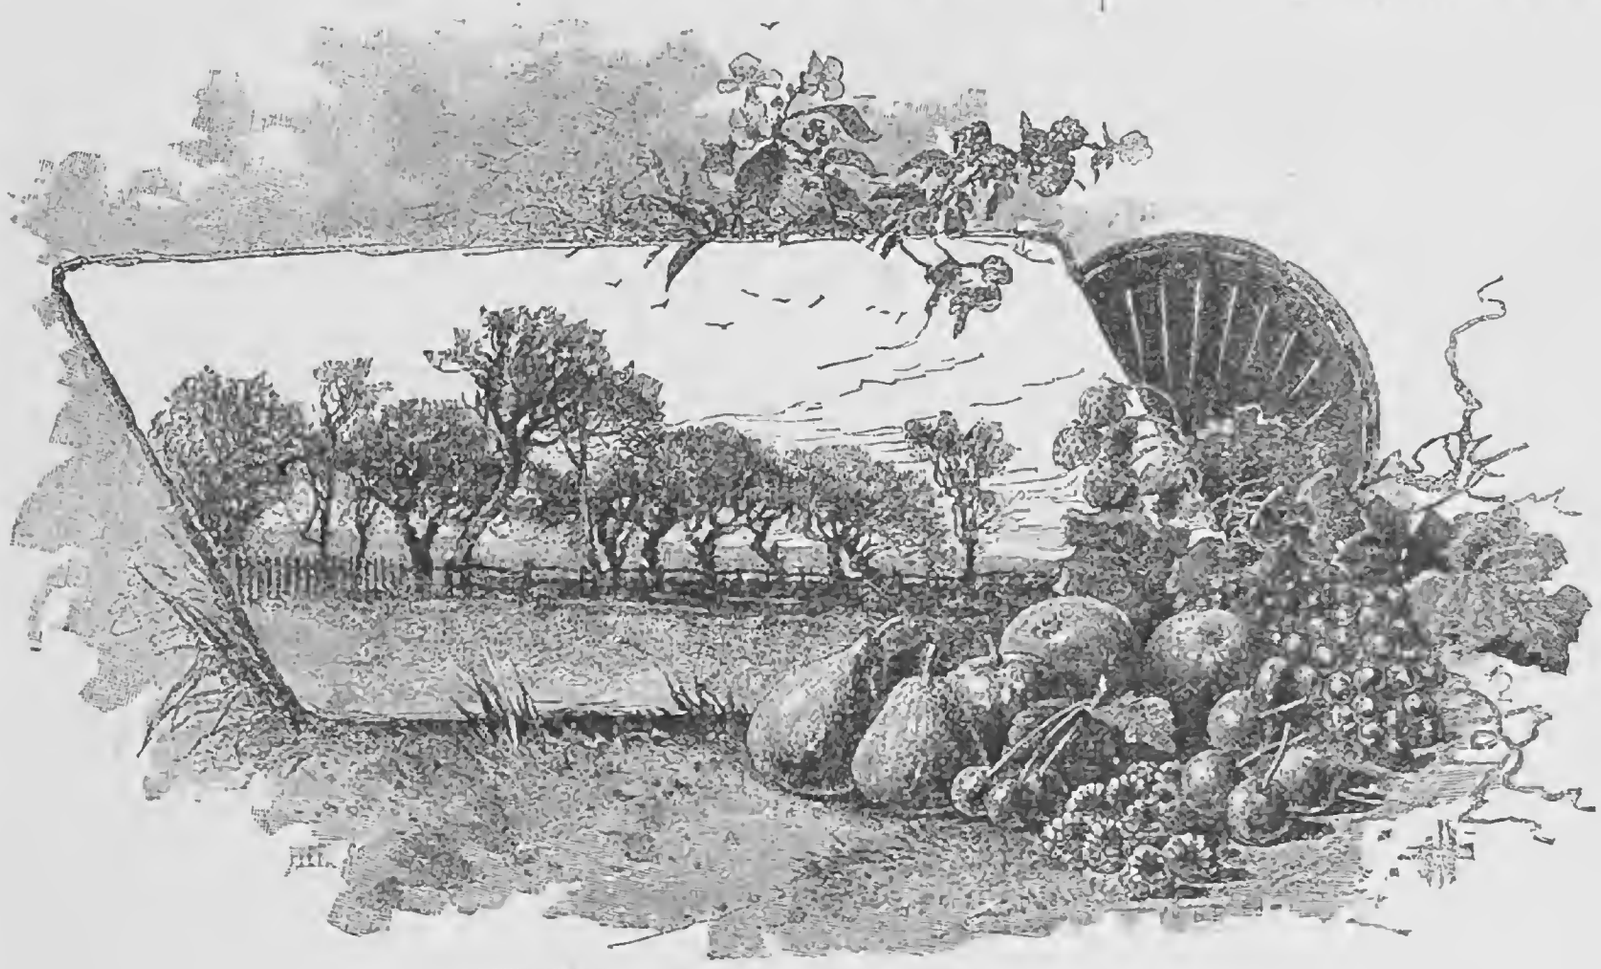
THE ZOLOTOREFF APPLE.

Grafts of this variety, (which much pleased Mr. Downing) grown upon (Duchess of) Oldenburg, have fruited with me this season. It is distinctly larger than Duchess, less oblate, a little irregular, and inclined to be angular. It is somewhat later than Duchess in season. I have not yet tested its quality, but Mr.

Downing says (3rd Appendix) "Flesh whitish, half-fine, tender, juicy, sprightly sub-acid, and of good quality." It is valuable as extending the season of the Duchess with a fruit certainly not inferior.

THE BERKOFF APPLE.

THIS is also an apple of the Duchess type,



AUTUMN. Re-engraved from The Queen. Fig. 372.

almost identical in form and color, but very much better in quality, being a mild sub-acid, spicy and soft-fleshed apple—a true dessert Duchess. The tree is a handsome, spreading grower that will require little pruning and promises to be a good bearer.

Orleans Co., Vt.

RURALISMS

ANOTHER season further attests the folly of using single eyes of potatoes for seed in heavy soil. The shoots made a slow, feeble start; the beetles ate them back; they started again; the drought came; result, a very small yield. Whole potatoes on scarcely better soil have given a good crop.

THE Industry Gooseberry is very promising. The fruit is very large and the past season was free from mildew. The plant promises to be productive.

AMONG strawberries, nothing tested has surpassed the Sharpless for size and productiveness. The Crescent yielded more berries in number, but less in measure. James Vick, with very high culture, gave an immense crop, but with ordinary culture the yield was quite inferior. Legal Tender did well and promises to be a valuable variety for our soil. The Prince (of Berries) surpassed all in richness of flavor, but was only moderately productive.

WITH me Henderson's New York Lettuce was the old Neapolitan, or Naples Cabbage known 20 years ago, and I know not how much longer. It is a good summer lettuce, but its color is too deep a green to suit many persons. The Tomhannock Lettuce sent out by Mr. Burpee, was the same as that which Mr. Gregory has been selling for several years under the name of Sugar Loaf. It is the largest-growing lettuce I know of, with perhaps the exception of the Bossin, and is excellent for Summer.

ONE advantage to be gained by bagging grapes, that I have not seen mentioned, is that the bags offer a considerable protection during hail storms. When such storms are very severe, much damage will, of course, result in spite of the bags; but in moderate hail storms, the kind we most often have, the bags will save a large proportion of the bunches from injury. I have tried using simple pieces of newspaper for bagging, or rather wrapping the bunches, with apparently good success. The pieces were cut about six by eight inches and were readily wrapped about the bunches and fastened by folding one corner over at the top and pinning. The sides were folded together, the bottom being left open. The wind and rain have disturbed these papers but little, and after a very severe hail storm, I find comparatively few berries injured on bunches thus protected.

I HAVE twice attempted to grow the French or Globe Artichoke, with partial success. The plants make an excellent growth during the Summer but are quite apt to winter-kill. About half of the plants perished in this way the past Winter, though they were protected with a light covering of straw. The yield of flower heads, which is the part used, on the surviving plants has been abundant. I fail to see, however, what there is in this plant that makes it so popular in France. Surely we have many vegetables that are more delicious.

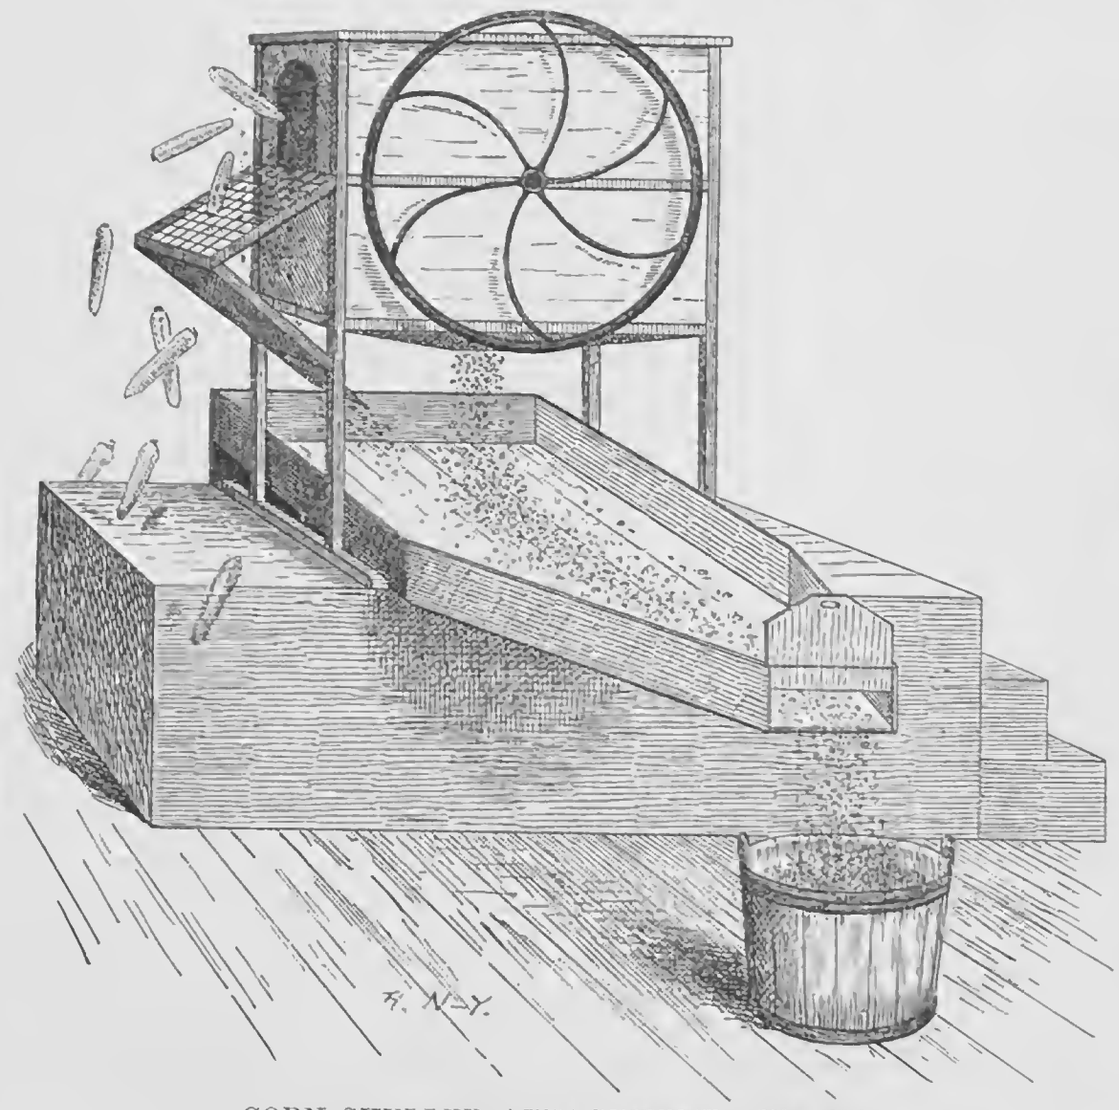
Farm Economy.

CORN SHELLER ATTACHMENT.

I HAVE been bothered by corn coming out of my sheller with the cobs and being trampled on and wasted, so I hit upon the device shown at Fig. 370. It is made of any kind of light wood. The top is covered with a piece of wire cloth, with ¾-inch mesh; this the corn goes through, while the cobs roll over. The



CORN SHELLER ATTACHMENT. Fig. 370.

corn is received through the sieve into a small trough below, and runs back into the large trough, and thence to the measure or bag. The trough to receive the corn from the sheller is made of ordinary boards, (mine are 10 inches wide and ¾-inch thick) and has a sliding gate at the end. My sheller is set upon a platform, 4½ feet long, 2½ feet wide and 20 inches high, so as to get a slope for the corn to run out, but it may be flat on the floor, and then the corn can be taken out with a scoop shovel. E. A. B.

Gurney's, Va.

RYE STRAW FOR STOCK FEED.

THERE will be a big rye crop in this part of the country. The price for straw will be way down. If I can't get five cents a bundle, I shall feed my straw out. I can get five cents out of every bundle of it for feed and manure. It will be worth almost that much to chop up and put back of the stock to hold the urine. Rye makes a better feed than most people think. I have fed hogs on cooked rye meal with fine results, but I don't think rye is best

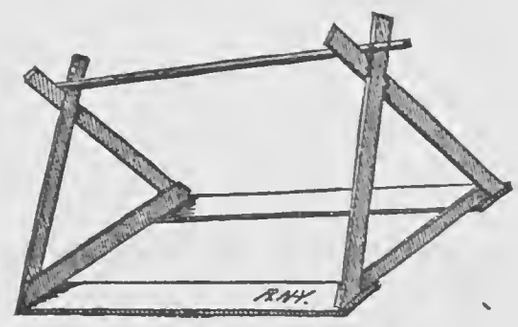


Fig. 371.

to feed alone to horses or cows. I would take one-third each of rye, oats and corn and have them ground together. That makes about as fine a feed as I want. Rye is a better crop for us to raise than wheat. V. H. W.

Passaic Co., N. J.

FRAME FOR FENCE WIRE SPOOL.

THE rack shown at Fig. 371 is to go in the hind end of a wagon when making wire fence. It should be as long as the wagon-box is wide, and high enough so that the arms of the wire spool will clear the cross-pieces of the bottom, while the wire must run clear of the wagon-box. The rack may be made of boards 1x4 inches for the ends, and 1x8 across the bottom, fastening the end frames together. The rod or roller, on which the wire spool hangs is made of wood, or an iron bar may be used, or even a piece of a fork handle. The rack may be fastened to the bottom of the wagon by screws, or by a single bolt through the forward piece.

WAGON JACK.

THE wagon jack shown at Fig. 368, may not be new to our readers, but it is simple and easily made. A A is a plank two feet long, two inches thick by eight inches wide. B is an upright piece 2x4 and two feet six inches long, and is nailed and braced to A A. C is an inch piece four inches wide and three feet long, and works on a bolt in the upright B. D is a chain fastened to A and hooking on to a nail in lever C. The dots indicate holes in the upright, B, which allows the lever, C, to be raised or lowered to suit the hight of wagon or buggy.

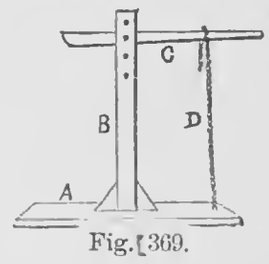

Fig. 369.

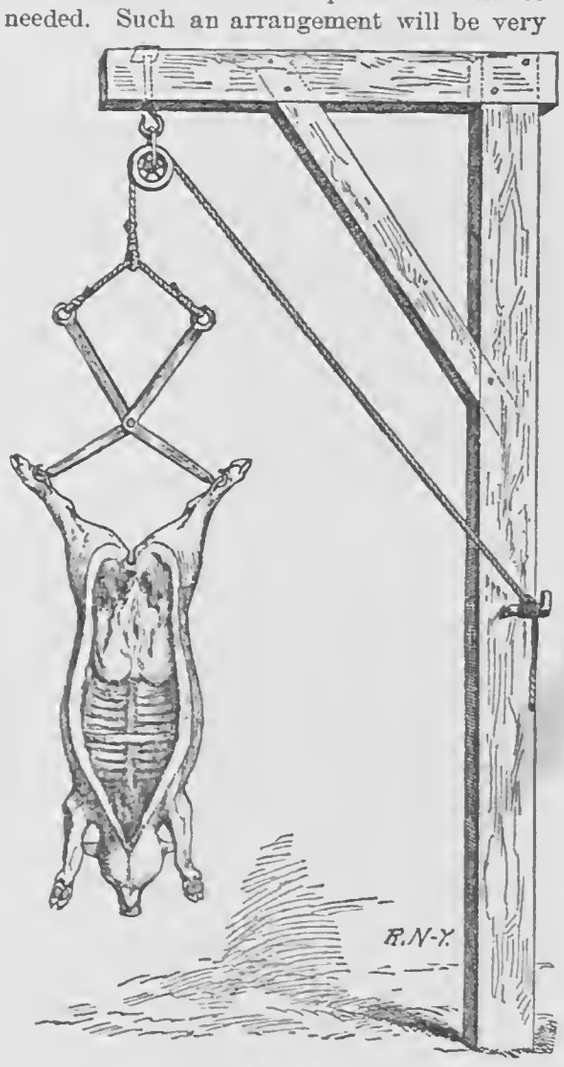
AUTOMATIC GAMBREL.

THE device shown at Fig. 369 is so plainly drawn that but little explanation will be needed. Such an arrangement will be very



AUTOMATIC GAMBREL. Fig. 369.

handy at hog-killing time. The iron bars which hold the hog are one inch wide and half-an-inch thick. They are held by a stout bolt at the angles. The harder the rope is pulled the further apart the legs are drawn.

What Others Say.

THE JAPANESE SNOWBALL.—We copy the following from the Philadelphia Weekly Press: "The RURAL NEW-YORKER wants to know who would have the old-fashioned Guelder Rose when he can get the Viburnum plicatum A good many people, we think. An old Guelder Rose is one of the noblest of shrubs. We know a specimen by a cottage door, which tosses its snowballs fifteen feet in the air and covers a circle of nearly as great a diameter with branches arching to the ground on every side. The foliage is coarse, but of good color, and fades into attractive tints in Autumn. We know no specimen of the so-called Japanese species that has attained sufficient age to prove how it will then appear. It is a good shrub, although we do not consider the bronze color of its leaves at the ends of the shoots a beautiful feature and we have noticed a disagreeable habit in some of the flowers in the ball browning or burning and thus spotting the snowy whiteness of the cluster. It winter-kills at the ends of the twigs in latitudes where the old species never fails. By the way, is not our native Viburnum opulus, known as the High Bush Cranberry, as good as either in some situations? It has the advantage of showy fruit, which is not inedible."

SOME English hop growers, after gathering the hops, are using the vines for silage. One party tells the Mark Lane Express that he ex-

pects to save 60 tons of hay in this way this year. He is putting them up in stack which is pressed down by means of chains. . ....The British brewers contemplate doing without the hop merchant, so that the factors will be the only middlemen. The curtailment of middlemen would be a blessing everywhere. .....Agents of English grain merchants, reporting on the quality of spring wheat in widely separated parts of Dakota and Minnesota, say it is of superior quality — berry plump, very bright, free from foul seeds, and very hard. Even sections that usually produce soft wheat, produce hard this year. Owing to its excellence for milling it is thought that an unusually small proportion will be permitted to leave the country as grain; as the millers will prefer to yield a point to retain it for flour.....Cork, Ireland, has always been famous for butter; but so bitter is partizan feeling just now, that Orange Major Sanderson said in the House of Commons the other night, that the butter is only fit for adulterating butterine....Last month 500 Guernseys were imported into Ireland According to the Mark Lane Express, these are supposed to be the first pedigree Guernseys ever introduced into the country.

MR. BROWNING says that the lawyer and the doctor have most to do with the pound of cure; the farmer is most interested in the ounce of prevention..... ....

"THE hope of America is the homes of America," says Dr. Northrup. When every citizen is stimulated to make his own grounds and wayside neat and attractive, the whole town becomes inviting. The homes of any people plainly tell their state and traits, their thrift and ambition, or sloth and improvidence.....

DR. NORTHRUP has worked as earnestly as any man we know of to improve the homes and home life of the American people, and to help in the practical realization of the cardinal truth that the chief privilege and duty of life is the creation of happy homes. The multiplied ministries of Nature, Providence and religion, center in the maintenance of happy homes. The higher aim of the industries of life, and the end for which government itself should be sustained, is that men may live in happy homes. When such is one's ideal, and his home is his pet and pride, life has new significance and value. Such an ideal brings new cheer and inspiration for one's daily duties....

DON'T give the horse-race character by attaching it to the agricultural fair, says the Orange County Farmer. It is a parasite and like all parasites injures or kills the object to which it clings.....

IT is a peculiar fact, says Mrs. Annie L. Jack, before the Montreal Hor. Soc., that even farmers' daughters who feed calves and make butter—doing the churning and milking, besides the arduous kitchen work of a farmhouse—are proud to say they "do not work out of doors," and affect to despise this health-giving labor. But Mrs. Jack has never yet found a girl who, if once interested in the pleasant occupation of fruit and flowers, was willing to give it up and return to the labors of the kitchen stove, the wash-tub and the ironing table.....

WHERE the trunk of a fruit-tree grows near the boundary of a field and the branches hang over another man's land, Mr. Browning of the Connecticut Board of Agriculture, decides that the fruit all belongs to the owner of the land where the trunk grows or enters the soil. He says that no one has a right to appropriate the fruit because it falls on his land. The owner of the tree may pick up the fruit on the neighbor's land if he cause no damage in so doing. The neighbor has a right to cut off the overhanging branches even with the line. But if he allow them to remain and the fruit to ripen and drop, they are not his.....

AS the land will not give us full crops unless supplied with every kind of plant food needed by those crops—so hens in order to lay well, should be fed all the material for forming eggs.....

THERE is a growing partiality for white fowls, says the Vermont State Journal. The reason is plain. A white fowl is easier plucked, the pin-feathers not being so easily discernible, while the skin and legs are usually of a golden yellow.....

EVERYBODY likes to be posted. To this end it is desirable that every reader should send for the new RURAL POSTER and post it up in his barn or carriage-house. .....

THE Weekly Press says that in spite of the accepted opinion that grass is the foundation of successful agriculture, farmers generally know less of the various species of available hay and pasture grasses than they do of any other plants on the farm..... .....

IT is true, remarks Mr. Gould in the above paper, that good butter makers are somewhat rare, but it is equally true that there are different ways to make equally good butter. One maker will succeed by one plan and absolutely fail by attempting to copy the successful mode of another.....

PROF. A. J. COOK, of the Michigan Agricultural College is in favor of sowing wheat when it seems best to sow, the land having been properly cultivated and manured. This, he thinks, is the best way to meet the Hessian fly. A healthy plant, he says, will stand some injury and send up fresh shoots in the place of those injured.....

THE most unsatisfactory crop of wheat the the RURAL has ever raised was sown September 25, in a dry time. The wheat sprouted but was too much injured by the continued dry weather.....

THE Dairy says that milk varies very much in its quality for butter-making. The creameries make a pound of butter from thirty pounds or fourteen quarts of milk, but they do not skim it closely. A fair, ordinary quality of milk will make a pound of butter for each twelve quarts. The best it has heard of is a pound of butter to four quarts; but that was an extraordinary cow. A good cow should make a pound of butter from seven quarts.....

THE Dairyman says that the use of brine among butters is much more popular than it used to be. It is now used by many in washing butter, and some salt their butter only by brining it. If brine is used in washing, and fresh water is not subsequently used, brine salting will make the butter as salt as it ought to be, or as most people like it.. .....

FROM the fact that sweet and sour cream require different temperatures for churning, the above journal states that the two should never be mixed. They cannot be churned together without loss. At least twelve hours should intervene between the churning and the last addition of cream, that the whole mass may become in the same condition.....

DR. FERDINAND COHN, of Breslau, has discovered a new disease in potatoes. The stalks begin to turn down from the roots upwards, and the leaves fall away and wither. On examination it will be found that the stalks have been hollowed out, and the hollow filled with a rotten substance. Cohn found in this hollow the larvæ of a fly which had eaten the stalk. These larvæ are footless, ringed, round, yellow, with the posterior end rounded, and the anterior end pointed and black. The disease appears in only some sorts of potatoes. ....

A. J. CAYWOOD, the veteran fruit-grower of Marlboro, N. Y., says, in the Orange Co. Farmer, that he was astonished to see a certain horticultural editor (doubtless referring to the R. N.-Y.) assert that one hill of the Lucretia Dewberry will occupy as much ground as three or four hills of standing blackberries, while the facts are that two hills of Lucretia will occupy about the same ground as one hill of a large-growing standing blackberry.....

MR. CAYWOOD has quite a large patch of this running berry planted for market four feet apart each way, and keeps them under better control than standing berries can be kept at the same distance. A person of his acquaintance scouted the idea of planting a dewberry, but after seeing how Mr. Caywood had them arranged, concluded to plant an acre. Mr. C. says he was never more enamored of a fruit than with the Lucretia on its first bearing .....

WELL, the R. N.-Y. has this one word to say in reply: We hope we were wrong.. .....

PUCK asks if the old saying "what will cure one will kill another" applies to the curing of hams?..... .....

SEEDSMEN are now ready to deliver all sorts of hyacinths, tulips, narcissus, etc., for fall planting. Even a little bed, say five feet in diameter, is a delightful sight in early Spring.

ONE of the finest plants we know of is the old Trumpet Creeper trained in tree form, as alluded to by the Gardener's Monthly. Plant a stake near the young Trumpet Creeper and when it reaches the top cut it off. Remove also all side branches as they appear from the stem as high up as desired. In a few years it assumes a beautiful weeping-tree form, while the stem or trunk will have grown large enough to support it by the time the stake rots ....

MARK all lawn trees now that are interfering with each other, that the least valuable may be transplanted or removed during the Winter. One fine specimen is worth more than two poor ones..... ... .

MR. S. B. PARSONS says, in the Gardeners' Monthly, that his Weeping Beech is 50 feet high and 50 feet broad, with a living house for its interior. He praises the Weeping Sophora as a graceful, feathery mass of the softest foliage; the Weeping Hemlock as resembling an evergreen fountain. The Weeping Silver Fir and the Weeping Norway Spruce have each their own merits and give that variety of form which, with variety of color, makes the picturesque lawn which all admire.....

THE best time to transplant in the Fall is just as soon as the leaves begin to change color or to wither. If we wait longer, the transplanted tree has the less time to recover before freezing weather sets in. If the soil is very dry, fill the hole with water and throw in soil until it is filled with mud. As this sinks, throw in more soil and water until the hole is nearly filled. Then finish with dry soil and cover the ground about the tree or shrub with leaves, straw or something of the kind...

MR. MEEHAN says that many now-a-days who want to plant trees in the Spring, buy in the Fall, and plant all temporarily thickly together, no matter if the stems are a foot or more deep in the ground, in some nook sheltered from drying winds. Here they remain till Spring, sheltering one another, as well as being sheltered. The advantage is that the wounded roots heal over, and when replanted in Spring, push into growth a couple of weeks before those then freshly taken up. Besides this, there is the great advantage of having them on hand to plant just when you are ready, instead of having them rushed in just as something else is sure to demand immediate attention.....

THE U. S. Dairyman says that the cry is that honest dairymen cannot compete with men who use cheap fat in making bogus butter. In the same way how can honest milkmen who feed pure, sweet grain, hope to compete with those who use rotten refuse or swill? This is a fair question and fairly put; the miserable goods of dishonest and incompetent dairymen have furnished the defenders of counterfeit butter with many of their best arguments..... .....

THE above journal quotes a contemporary, without giving its name as it should do, as saying that it is strange that people still think that they can strain filth out of milk. It can't be done. Filthy milk will be filthy to the end of the chapter, and all the straining in the world will not make it pure. When a cow steps into the pail she steps into the butter plate . ...

AN interesting experiment, showing the influence of electricity on the growth of roots, has been made in Germany by Professor Holdefleiss. Plates of copper were thrust upright into the earth and connected by wires with similarly placed zinc plates about 100 feet distant—an electric battery being thus formed, with the earth between the copper and zinc in the circuit. Both potatoes and beets planted between such plates gave an increased yield—beets 15 per cent., potatoes 25 per cent.—as compared with other parts of the same field ..

CONTAGIOUS pleuro-pneumonia having lately broken out in Forfarshire, Scotland, the inoculation of the affected animals was advocated by the local authorities charged with the treatment of the disease. Several instances were mentioned where, after such treatment, the disease was stopped without any loss from milk or otherwise, except that the cows operated on lost their tails more or less, as the operation had to be performed in the lower joint of the tail..... ....

WE want apples and peas and peaches to grow bigger downwards in the box, basket or barrel. We want to find the bottom berries of rasp, black and straw the best in the box. Then we want to know who puts up fruit in that way and to encourage him by asking for his fruits and showing a readiness to pay for them..... .....

DO you need a complete or partial fertilizer for your land? If one element exists in the soil in excess, that element may be omitted. How can you find out what elements are in excess? Only by trial..... .....

Everywhere.

RURAL SPECIAL REPORTS.

Illinois.

CHAMPAIGN, Champaign Co., Sept. 8.—Weather dry and warm, if not hot; regular fly-biting, corn-ripening, south-windy weather. East of the 90th meridian and to farther Eastern Indiana the corn crop is an immense one; west of it and to the mountains of Middle Colorado there is scarcely corn enough for seed and bread. B. F. J.

Indiana.

PENDLETON, Madison Co., September 4.—We have uniformly good crops in this part of the State. Wheat is an average of fully 20 bushels per acre, and the quality is good. Our lands are generally tile-drained, which has proved an antidote to blight and rust, and a good insurance against freezing in Winter and drowning out at any season. It has also added 25 per cent. to the comfort and health of our rural population. Much more time is devoted to preparing the ground for wheat than formerly, and the increase in quantity has more than compensated for the increased labor. It is well plowed, and then harrowed and rolled until there are few clods. The drill is then used, which completes the operation. Our best farmers have an average of 25 bushels per acre; our worst 10 bushels, with a slow but steady increase from year to year. Corn, oats, rye, barley, buckwheat and potatoes will average 100 as compared with last year or a series of years. S. W. H.

Kentucky.

NICHOLASVILLE, Jessamine Co., September 4.—We have had the best season and consequently the best crops we have had for 36 years. D. W. A.

Michigan.

CAMBRIA, Hillsdale Co., September 6.—Crops are good. Some yields of wheat as high as 35 bushels per acre. Corn a little shortened by drought, but not as much as hay and potatoes. Recent rains have made the pastures green. Apple trees are breaking under their load and other fruits, except peaches, have been abundant. Wheat, 75 cents; corn, 45 cents; oats, 30 cents; potatoes, 35 cents; butter, 13 cents and eggs, 12 cents. A. J. MCD.

New York.

UTICA, Oneida Co., Sept. 13.—The market for butter is firm. Prices are a little advanced. While some good dairy butter is bought for 18 and 19 cents, the bulk brings 20 cents., and good creamery 21 and 22 cents. Thirty packages were bought to-day at 21 cents. The number of packages bought during the week was 105 at prices as stated. A prime article is said to be scarce. Little Falls sold dairy at 18 to 20 cents, and creamery at 21 cents. The Cheese market opened a little dull, but toward the end displayed considerable activity and closed firm and strong. Prices will hold this week, and the indications are for a still better market. The Board sales were as follows: 900 boxes at 9⅜ cents; 4,438 boxes at 9½ cents; 700 at 9⅝ cents; 1,400 boxes at 9¾ cents; 878 boxes at 9⅞ cents; 1,890 boxes at 10 cents; 84 boxes at 10¼ cents; 358 boxes on private terms and 210 boxes on commission—total, 10,852 boxes, ruling at 9½ cents, which is one-quarter cent higher than last week. Little Falls sold 7,746 boxes to-day at 9¾ cents. The cheese men held back for the higher terms and the market was slow. The hop market has seen a slight change in the last week and the hops being about picked, where there are any, there have been a few sales. Those heard from in this county have been worthless as a base for prices. They have merely been sales of hop refuse. About 10 bales were sold the other day in Clinton for 15 cents a pound. They were in bad shape and certainly not worth any more than was paid for them. Some good hops have been sold at 35 and 40 cents in small quantities. In Chenango County the crop is reported better than expected, but the acreage in this county is small. There have been one or two good yards in Otsego County, In some districts the presence of a small worm at the roots of the vine is reported, and it is feared that the plant will be destroyed. Lewis County has 400 bales against 5,000 last year. R. L.

Tennessee.

TULLAHOMA, Coffee Co., Sept. 4.—Crop outlook very promising: wheat was more than an average crop, and has been put upon the market at 65 to 75 cents. Corn is selling at 50 cents; oats, 30 cents; rye, 75 cents; potatoes (new) 60 cents per bushel. Stock of all kinds low. Apples plentiful at 30; peaches an entire failure in this section. C. L. N.

Texas.

MEDINA, Bandera Co., Aug. 30.—On the 20th we had a most terrible storm. It began in the morning and lasted for about seven hours. It started from the north, from which direction it blew for three hours, increasing in force all the time until it carried everything before it. Thousands of bales of cotton are beaten into the ground and farmers in Western Texas are greatly discouraged. Corn was a failure on account of drought; the cotton crop, too, was cut short. It would have averaged ⅛ of a bale per acre, or five dollars, which would not have paid for the work expended. Now even that is lost, for the rain beat the cotton into the ground, and it is now sprouting. Such is the dark side of farming. But the rain has started the grass, and if we have some more rain we will probably have a fair Winter range for our cattle. Most of them would have died from starvation before Winter, were it not for the rain. I have been feeding my cows for about six weeks, but to-day they refused to eat corn fodder, because they got a taste of green grass. Times are hard. Prices are very low; cattle no sale. Hogs, fat, $2.35 per hundred. Corn, which we have to buy, is 60 cents per bushel, while some farmers sold theirs two months ago at 30 cents. I fed mine into hogs which I cannot sell without losing money. W. S. H.

Vermont.

NEWPORT, Orleans Co., September 6.—We have a large crop of apples this year. T. H. H.

INFLUENZA IN MULES.

H. H. S., Leipsic, Del.—I have lately lost five mules from some disease with the following symptoms: Rejection of "cud;" dry cough; loss of muscular power; high fever; very offensive breath; yellowish, thick discharge from the nose; tongue and mouth dry and hot; rattling in the throat; morbid lesions; pus in left frontal sinus; lividity and ecchymosis of right lung, and slight adherence to pleura. Considerable effusion of a reddish, foamy, bloody water in the trachea. The animals were in good order, and did not run on grass. Now, what is the cause, and what should have been the treatment?

ANSWERED BY F. L. KILBORN.

Evidently a catarrhal form of influenza, in which the lungs were quite seriously implicated. Uncomplicated cases rarely prove fatal when promptly attended, with proper care. In these cases the local inflammation must have been very severe, or perhaps the animals were improperly treated, with lack of suitable care and diet. Being a disease that runs a definite course, more usually depends upon the care and diet of the animal than upon the medicinal treatment. A clean, dry, well-ventilated, comfortable stable, preferably a box-stall, is very essential. Blankets, and bandages to the limbs, must be freely used when necessary, to make the animals comfortable. Draughts of air are to be avoided. The diet should consist mainly of mashes, boiled oats barley or linseed, with roots, or other green food in moderate quantity. Allow free access to good *water*. Frequent steaming of the nostrils is very soothing to the inflamed air-passages, favors free secretion, and relieves the cough. This is very easily accomplished by feeding hot mashes from a pail or nose-bag. Externally, the throat may be bathed with water as hot as the hand can bear, rubbed with ammonia and oil, or a mustard blister applied. Internally, the following prescription may usually be given with advantage: mindererus spirit and sweet spirits of niter, each one ounce; extract belladonna one dram, to be given two, three or four times daily. Constipation is best relieved by copious injections of warm water. While, as a rule, purgatives are to be avoided, small doses of oil may be given, if thought desirable. In mild cases little or no medicinal treatment is necessary; but special attention should always be given to the care and diet. During the course of the disease the animals should be kept quiet, exercised gradually while recovering; but under no circumstances allowed to return to work until fully recovered. When convalescence is tardy, a course of tonics is desirable—an ounce each of Epsom salts and powdered gentian, and two drams of niter, night and morning. On alternate weeks the gentian may be replaced by two drams sulphate of iron.

RED WATER IN A SOW, ETC.

J. C. H., Summerville, Ga.—My two-year-old sow farrowed in July and was in good health until two weeks ago, when she began to grow poor, and reel about in her hind quarters. She ate heartily till two days before her death. The morning she died blood passed with her urine and she had also a slight cough. One of her pigs drooped, had a cough and bad breath, and white matter ran from its nose. I pulled some black teeth out of its mouth, but that didn't do any good. What was the trouble?

ANSWERED BY F. L. KILBORN.

With the sow the symptoms indicate a dietetic disease commonly called "red water," usually due to feeding on wet, new or inferior pastures which furnish unsuitable or innutritious food. In addition to unhealthy soils, general defective feeding is a predisposing cause. In this case the sow was greatly weakened from the birth and nursing of the young pigs. As treatment the sow should have been confined in a clean pen, given an ounce of olive or castor oil, and sustained on a laxative, nutritious diet, as mashes, gruels, boiled linseed, etc. The following prescription might have been given with benefit: potassium chlorate and powdered gentian each one-half dram, ether and mindererus spirit, each one dram, to be given cold in ale or linseed tea three or four times daily.

The symptoms of the young pig indicate simply disease of the respiratory organs, probably broncho-pneumonia. The treatment of so severe an attack on an animal so young is usually not very satisfactory, and in all severe cases of disease of the air-passages the treatment is constantly being varied to suit the varying symptoms, so that it would be very difficult to briefly indicate a proper course of treatment.

WATERY EYES IN A HORSE.

S. McF., Tower City, Dak.—Very clear water has been running from my horse's eyes all the time for a month, sometimes in a stream. There is also some discharge from the nostrils when he is drinking. He has been affected in the same way before. He seems in good health and works every day. What ails him?

ANSWER BY F. L. KILBORN.

The difficulty may be due to stricture or closure of the lachrymal duct or to any inflammation of the eye producing an increased secretion of tears to such an extent that the duct is unable to carry them away. The very copious secretion in this instance would indicate such inflammation, which may be due to some foreign body in the eye, to any local injury, or to any abnormal position of a portion of the lids. From the absence of other symptoms and the fact that the cause of the irritation appears to be more or less permanent, we are unable to diagnose very closely. As general treatment, keep the animal in a darkened stable and protect the eyes from light by a calico bandage. Bathe the eyes frequently and keep the bandage wet with a weak, tepid solution of borax, to which add a few drops of tincture of belladonna. The animal must be protected from a draught or cold. Keep the stable clean, so that there will be no irritating gases from dung, urine or other decaying substances. Unless the bowels are already loose, give five or six drams of aloes, and follow by a restricted, laxative diet. If after a week there is little or no improvement, use the following lotion for a few days, after which return to the borax and belladonna, or other simple tepid lotions: Lead acetate one-half dram, morphia 10 grains, water one pint. If this treatment is unsuccessful consult a veterinary surgeon, or if there is none available, call the family physician and ask him to examine and treat the same as he would the human eye under similar conditions.

DIVIDING RHUBARB ROOTS; RADISH AND SPINACH WORMS.

W. J. P., Leadville, Col.—1. Can I divide the roots on a plot of rhubarb which has stood for four years, without injury to the next year's crop; if so, how? 2. For two years my radish and spinach crops have been greatly injured by a worm like the cabbage worm; what is it and is there a remedy?

1. Yes. Remove the earth from one side of the plant sufficiently to expose the crown of the root. Select a part of the crown that is furthest from the center, and with a butcher's knife sever one of the branches of the root-stock that contains an eye. It may be done late in the Fall or early in Spring. 2. The insect that infests the roots of the radishes is, doubtless, an anthomyia, and is very closely allied to the cabbage maggot and onion maggot. We believe some entomologists consider them all varieties of one species. Plant radishes on soil containing a very large proportion of sand, to avoid injury from this pest. The insect that infests the leaves of spinach is probably also an anthomyia. We know of no remedy, as the maggots are protected from applications by living between the two surfaces of the leaf. We would suggest planting on ground that has not recently been devoted to spinach or beets, and as entomologists are not sure whether this anthomyia is distinct from the ones that infest cabbages and radishes, it would be well to avoid, also, ground that has been devoted to these crops, provided they have been injured by the maggots.

A BARREN COW.

H. H. W., Pomona, Col.—Two years ago I bought a four-year-old cow, said to be with calf; but this turned out not to be the case. She was put to the bull half a dozen times the first year I owned her, but in vain. Last year she took the bull four or five times, and then was quiet for some time. A month or two afterwards, I think, she miscarried, and in a few days she was in heat again, and since then she had the bull two or three times without getting in-calf. Her milk yield has dropped from seven to about two quarts a day. What should be done with her?

ANS.—Dry her off and feed sparingly for a month or two. Watch closely to make sure there is no discharge from the vagina. As she comes in heat, have her served by one bull, and the next time by another. If after three or four trials you are still unsuccessful, and no disease of the generative organs can be discovered and removed, we can only recommend that you sell her for beef. Similar cases are not very uncommon. See Sterility in Mares in the Farmers' Club for July 3. With cows a much smaller per cent. are unfruitful, usually not over one to two per cent. The fact that a cow takes the bull is sufficient evidence that she is not with calf.

TREATMENT OF INSECTS FOR A COLLECTION.

G. A. T., Bella Silva, Pa.—I wish to begin a collection of insects. What is the best substance with which to kill them, and how should they be treated to prevent drying and crumbling?

ANS.—The most satisfactory substance with which to kill insects of all kinds is cyanide of potassium. A lump the size of a small hickory-nut should be broken into three or four pieces and placed in a large-necked bottle, with a tightly-fitting stopper. Glass-stoppered bottles are the best, and then plaster-of-Paris should be poured in until the lumps are well covered. In a few moments after being placed in the bottle, the plaster will set, and leave a little water standing above it. This should be poured off, and the uncorked bottle be set in the sun for a few hours to dry. A bottle filled in this manner often does good service for a year. Chloroform or ether may also be used by putting a few drops in a bottle or box, with tightly-fitting cover, in which the captured insects are placed. There is no substance in general use, if in use at all, to prevent drying and breaking. The drier a collection is kept, the better; and to prevent breaking, handle with care.

SOD LAND FOR POTATOES.

J. S. B., New Berlin, N. Y.—I have a piece of sward plowed last August, and I wish to plant it to potatoes next Spring; how shall I treat it so as to put it in the best condition?

ANS.—Cultivate and harrow it often enough this Fall, so as to keep it clean and subdue the sod. In Spring plow it well, cutting the furrows narrow so as to pulverize and mix it thoroughly. If any stable manure is to be used, it should be well rotted and spread before plowing in Spring. It would be better if put on early in Winter, so as to be dissolving by frost and rain and mixing with the soil. If commercial fertilizers are to be used, they should be put on after plowing and thoroughly worked into the surface. There is no danger of getting land *too* mellow and fine for potatoes.

GRASSES.

S. W. O., Ridgewood, N. J.—1. What grass and fertilizer would be best for a horse paddock on sandy loam land? 2. What is the best grass mixture for a lawn?

ANS.—1. We can think of nothing better than a mixture of Creeping Bent, Red-top, and Blue Grass. We should recommend stable or farm-yard manure. In the absence of this, use at the rate of three bags of raw bone flour, one bag of sulphate or half a bag of muriate of potash, and 100 pounds of blood. 2. For a lawn use either Red-top or Blue Grass or both. This is just as good in every way as the higher-priced lawn mixtures.

Miscellaneous.

Amateur, Delaware, Ohio.—1. What winter protection is needed for Clematis crispa-Jackmannii and coccinea? 2. How are the Walbridge, Wagener, Haas, Saxton, Lawyer, Shiawassee Beauty, Munn, Jefferis, Red Bietigheimer, Blue Pearmain, Black Detroit and Blenheim Pippin Apples as to hardiness and quality?

ANS.—1. The Clematis mentioned should be hardy in your climate. 2. We do not know as to Walbridge. Wagener is very hardy, best quality. Haas (Fall Queen) is hardy enough for Ohio, but succeeds better in the South. Fair in quality. Saxton is fair in quality and hardy, but does not thrive in Ohio. Lawyer is very good. It does not thrive in Ohio. Shiawassee Beauty is very good and hardy, succeeding only in Michigan, so far as we know. Munn is hardy, fair quality. It will not succeed with you. Jefferis is of fair quality, hardy and succeeds pretty well in Ohio. The Red Bietigheimer is a large, showy German apple of fair quality. Blue Pearmain is a hardy apple of fair quality, but we have no evidence it will be profitable in Ohio. Black Detroit is of poor quality, (Grand Sachem). Blenheim Pippin is of fair quality, hardy. Does not succeed in Ohio.

Herder, Llano, Texas.—When some of my lambs are ruminating, there is a constant flow of saliva from the mouth. In about two weeks they begin to scour badly; but this eventually disappears and they are left with a large lump under the throat; what ails them and what can I do for them?

ANS.—It is impossible to tell from so imperfect a diagnosis; but the symptoms are probably not all due to the same cause. The flow of saliva and the scours are very likely due largely to some poisonous weed eaten. A close examination may reveal the cause. If not write us more fully.

B. P. Van H., Fridley, Mont.—The oats sent for name seem to be the White Russian, the other is called variously Montana Rye, Diamond Wheat, Polish Wheat, Polish Rye and Big-seed Wheat. It is really Polish Wheat, a distinct species.

O. J. J., Allen, Md.—Jerseys and Alderneys are not the same; but the Jerseys in this country are often miscalled Alderneys. Alderneys are very like Guernseys, and are included in an Appendix of the Guernsey Herd Book.

S. O. R., Vencentown, N. J.—The pears you sent for name are undoubtedly Bartletts. We sent one of the specimens to Ellwanger & Barry who think the early ripening is due to the influence of the stock.

C. B. B., Norfolk, Va.—Who makes brick machines?

ANS.—Penfield & Son, Willoughby, Ohio, and Frey, Sheckler & Hoover, Bucyrus, Ohio.

DISCUSSION.

THORNLESS BLACKBERRIES AND BLACK-CAP RASPBERRIES.

J. H. H., SOUTH GLASTONBURY, CONN.—In the RURAL of August 21, page 247, "F. C., Leominster, Mass.," asks whether there is any thornless raspberry or blackberry profitable for market. The answer is "No. We do not know what the berry which you speak of is from your description." In a general way the answer is correct. The thornless varieties are not profitable for market. Hoosick and Wachusett Blackberries have been well tested in private gardens all over the country, the former proving of little value anywhere; while the latter is favorably mentioned by about one-half of those that have cultivated it. I have known it for the past 10 or 12 years, and learned some time ago that under ordinary conditions it is not very productive, but planted on strong, rich soil, and well cultivated, it is very productive of berries about the size of the Kittatinny, and even better in quality. The plant is as hardy as the Snyder, and, being free from thorns, is much easier to work among in trimming, cultivating, and gathering the fruit; hence it has been largely planted for market in Worcester Co., Mass., and Hillsborough Co., N. H.; in fact, I think there are to-day more acres of Wachusett Thornless in New England than of all other sorts combined; but it should always be borne in mind that it will not yield paying crops on thin, light soil where Wilson, Kittatinny, Snyder, etc., can be grown at a profit. As to thornless black-cap raspberries, Davidson's Thornless, an old, well-known sort, was for a time quite profitable on account of its earliness; but the fruit being small, it soon had to give place to larger and better varieties.

The Springfield, a thornless variety of Massachusetts origin, has within the last few years attracted considerable attention in this section, the plant being as healthy as Souhegan and entirely free from thorns; canes as smooth as a willow, moderately productive, of medium to large berries, jet black, sweet and juicy, and ripening extremely early. It is sure to find a place in every family fruit garden, and to any market fruit grower that objects to the thorns on the older varieties, I would say, plant the Springfield; it's fun to pick the fruit and you will have no torn clothes or flesh during the cultivating or pruning season, as is often the case while working among all other black-caps. Our women pickers bless the day when we first planted the Springfield, and we shall increase our plantation of it next Spring.

R. N.-Y.—The R. N.-Y has reported upon the Springfield as it has behaved at the Rural Grounds—see page 461.

N. F. NICKERSON, ADRIAN, Mich.—I have about 10 acres of "Surprise" Wheat raised from the seed sent out by the RURAL. I will furnish it in four-bushel lots, in new bags, for $5 per lot; or at $1.25 per bushel in smaller quantity, with 25 cents for bag delivered on the cars; the price to accompany the order in all cases.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING September 11, 1886.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, SEPTEMBER 25, 1886.

IT is desirable that the RURAL NEW-YORKER should be represented at all the agricultural fairs of the country. Those who are willing to act as agents will be furnished upon application with posters and all the specimen copies they may need.

WHY not gather the seeds of the best grapes and plant them at once in beds of well-prepared soil? They will sprout next Spring.

THE Earhart Everbearing black-cap is bearing finely (Sept. 15) its third crop. The berries are large, and borne in clusters of from 16 to 40. It is a remarkable variety.

THE Alaska Peas planted August 16, are now a foot high and in bloom. It is our first trial with peas planted so late. The vines of the Spring were over two feet high when they began to bloom.

A FINE rain last week enables us to prepare our wheat plot just exactly to suit us. We are afraid that our attempted cross of rye upon the three-quarter hybrids will prove a failure. Two or three kernels may, however, grow.

OUR new mode of securing for potatoes moisture as well as air and sun-light, which we have called "Valley Mulching," will be described in a few weeks. The experiment was made in a small way, and the yield was so much increased that we shall try it more thoroughly another year.

ONE of the best Bird Cantaloupes raised from the seed of our last seed distribution weighed nine pounds three ounces. It was thickly netted and of fine quality. The size was 13 inches around the middle and 25 inches around lengthwise. Some of these melons are not netted at all; others are of the regular melon shape.

THE new Premium-List of the R. N.-Y. is available to all who send yearly subscriptions at the regular price, viz., $2.00. It is a matter of choice whether they retain the cash commission of 50 cents for each subscription in clubs of five or over, or select any of the articles from the Premium-List, which are scaled so as to allow an equivalent of from one to two dollars for each subscription, according to the arrangement which we have been enabled to make with the manufacturers.

THE American Forestry Congress at Denver, Colo., before adjourning Thursday night, adopted resolutions asking Congress to establish an agricultural and forestal experiment station in connection with the Department of Agriculture at Washington; also to pass a bill for the protection and preservation of the timber land now in possession of the Government and for the establishment of a Commission on Forestry to provide the means to prevent the destruction of forests by fire and the prosecution of persons setting fire to timber. The Forestry Congress has done much good in arousing attention to the necessity of forest preservation. Substantial progress has already been made. Public opinion is becoming instructed. A good deal has been done by some of the States in the way of forest cultivation; but there is need of vastly more. The rapidity with which timber is consumed is well illustrated by the fact that the railroads of the country require this year 80,000,000 ties for repairs alone. These are all from comparatively young trees. Railroad ties last only from one-fourth to one-fifth the time needed to grow them. When metal or paper shall have replaced wood for ties, a vast saving will be made in timber destruction.

FARMERS' CLUBS.

THE time is now coming when the live Farmers' Club will do its greatest good. There are many excellent clubs in the country, and their influence for good is beyond measure. Some of the very best work is done by the county or town clubs. These smaller associations are more like great families where the members are free to praise and criticize with no other motive than a desire to bring out the truth. The Westtown Farmers' Club, of Orange County, N. Y., is an admirable society. Its meetings are always well attended and lively. One admirable feature of each meeting is the "creaming" of some good agricultural paper. A member is appointed to study the paper and take off the cream—that is to take the heart out of the articles—and present them in the form of an essay or speech. Then the members can discuss the various points, add testimony if they approve and show wherein the wrong lies, if they object. This plan is a fine one, and many a good club can be built up by following it. Many clubs decay and die because the members simply talk themselves out, and tell all they know. By discussing the ideas advanced in a paper like the RURAL, they can discuss the ideas of over 1,000 persons through the year, and there will be no lack of new subjects to handle. We advise all Farmers' Clubs and Granges to adopt this line of work. Where there is a desire to organize a club, let three or four good farmers make it a point to meet now and then to discuss their favorite agricultural paper. They will be surprised to see how quickly others will desire to join them.

CANDIDATES AT FAIRS.

THE politicians are having rare times at the fairs this year. All the candidates, big and little, are glad to put themselves on exhibition by the side of prize horses and cattle. The people have a chance to look them over and judge them by the "scale of points" which every thinking man makes for himself. We see no reason for the outcry which is raised against candidates for attending public meetings. The people want to look at them. Suppose they do make speeches and shake hands. Are American farmers so simple that they believe everything that is told them? We hold that they have minds of their own and that no man's tongue can wag them away from what they think is right. We object to having the recognized speech of the fair delivered by some lawyer who tries to tell what he knows about farming and only succeeds in showing that he knows nothing; but if a candidate wants to come out and show himself as a side-show, why object? It is far better to have candidates so taught that they are willing to take off their hats to the farmer and beg for his vote, than to have them feel that the farmer's vote will come to them anyway. The keener the competition for the farmer's vote, the greater the benefit we shall derive from it.

POLITICAL TEMPERANCE.

THE temperance cause is gaining ground. The growth of a strong and permanent reform like this must of necessity be slow. It is an education and we must reach to the very bottom if we would form a rock-like basis. It is better to go slowly and steadily on than to rush into legislation that must be undone, or to spend time in correcting mistakes. The agitation against the saloon has been compared with that raised against slavery. In one sense the two are unlike. Slavery was a sectional evil. Those who fought against it knew little about its practical workings. It was possible to arouse an intense enthusiasm among those who had never seen a slave other than the few superhuman specimens who had the manhood and courage to escape. The cause of the saloon is not sectional. Its power is felt all over the country and faces us everywhere. It can be fought and overcome, but this cannot be done in a day. We look upon the recent meeting of Anti-saloon Republicans at Chicago as one of the most hopeful signs of the times. When Senators and ex-members of the Cabinet openly declare war upon the saloon we may well hope for definite results. There have been many denunciations of the liquor business, but few have been pronounced in sturdier or more pointed language than is contained in the following extract from the resolutions adopted at the Chicago convention:

"The liquor traffic as it exists to-day in the United States is the enemy of society, a fruitful source of corruption in politics, the ally of anarchy, a school of crime, and with its avowed purpose of seeking corruptly to control elections and legislation, is a menace to the public welfare and deserves the condemnation of all good men."

The action of these prominent Republicans cannot well be disregarded. They mean business of the most determined character. Let the party plant itself squarely upon a temperance platform and the politicians will surely come to time. This will give political temperance a dignity it has never before enjoyed. The question should be raised above a mere matter of party politics, however. We want the matter so managed and brought before the people that all temperance men can unite against the saloon and still feel free to vote upon other subjects as they desire. We welcome all honest efforts that tend to place the question squarely and fairly before the people, but we want no such humiliating spectacle as that of a man sliding into office under cover of a temperance cloak. May the day soon come when all good men can unite against the evil.

THE GAMBLING MANIA.

THE desire to get something for nothing and the belief that it can be done honorably seem almost universal. Speculators in produce and stocks are not confined to New York and Chicago; they abound in all parts of the country; but especially in the West. There every city, town and village has one or more grain offices, which during business hours, are constantly receiving quotations from the next large market while the Board of Trade is in session. For these dispatches they pay from $10 to $20 a month, and sometimes a number "chip in" to pay for them. Few legitimate business places in the towns are as well patronized as these. The farmers from the surrounding country are constantly dropping in to see how "she is going," and are just as constantly investing all they can spare and often more "on their judgment." The grain dealers of the section come or send in a clerk to get the figures, and they too frequently "back their judgment." The men "about town" who have any money to invest are frequent visitors. As the yellow messages pass from hand to hand, it is wonderful what unanimity of opinion there is that wheat, corn and pork are "bound to go up," for in nine cases out of ten, the country speculator is a "bull."

There are no goods on show, no samples even. It is simply a gambling den. There is no pretense of buying and selling. The patrons simply bet on the future price of wheat or pork, or whatever else they nominally buy or sell. The owner of the gambling "hell"—usually a several-times "busted" speculator—explains to his victims how, by a system of margins, he can control thousands of bushels of grain or barrels of pork with a few hundred dollars, and offers to take them into a "deal," which is a "sure thing," and the victims put their money into the "blind pool" and usually lose it. Even if the deal is successful, the "outsider" must trust to the honor of his "partner," and usually honor where "big money" is concerned, is a scarce commodity in that quarter.

Of course every patron soon knows all about "puts," "calls," "straddles," and the whole business, and has an abiding faith in his own "judgment." He may lose over and over again, but he is certain all the time that he can win it all back, and more too, if he can only raise money enough to invest. An occasional "hit" causes him to think himself the smartest man in town, and makes him as confirmed a gambler as the oldest patron of the faro table.

Very few ever come out of such dealings ahead. Most of them "spread themselves" too much, buying heavily on a margin of only a few cents, and a slight fluctuation "wipes them out;" or the chief manipulator, often in concert with another speculator at the central market, makes "snap" quotations two or three cents lower than the regular market prices, and "freezes them out."

The evils caused by this form of gambling are widespread. It has done nearly as much as poor crops and low prices to put a mortgage on many a farm in the West, and plantation in the South. How many speculative grain merchants who "backed their judgment" beyond their means, are now heavily in debt and carrying on business under their wives' names, or those of somebody else, if they have still money or credit enough to carry on business at all? When the farmer rides to town to learn "how the market is going," leaving a green hand to manage the farm, something is sure to go wrong. Careful bankers will not lend money to those known to speculate in produce, except on the best security, because the innumerable examples of those who have lost their all at the game render them distrustful of repayment.

What can be done to meet the evil which affects alike the blackleg gambler, the church-going storekeeper and the staid farmer? Special legislation seems powerless. The only hope appears to lie in a knowledge of truer business methods, a healthier public opinion, and a hearty condemnation of the sentiment that gambling in produce is a whit more honorable or honest than gambling at cards.

BREVITIES.

WHAT blackberry gives so much fall fruit as the Kittatinny?

THE Worden Grape ripens this year exactly with Concord at the R. G.

SIMON'S PLUM, which seems to be half peach or apricot, is worthy of trial.

How many pounds of milk from *your* cow does it require to make one pound of butter?

THE beautiful little Polyantha Roses may justly be called everblooming. They are hardy also.

OPTIMUS is the best tomato, all things considered, we have ever raised at the Rural Grounds.

THE Victoria Grape, which has borne immense crops for five years previously, fails this season.

We find the "Self-husking" Corn very much what is claimed for it—a somewhat rare occurrence as to novelties.

WE conclude that we had rather engage a stupid man who likes his work than a smart man who shuns it. Are we right?

THE Brazilian Flour Corn is decidedly different from any corn we have raised—quite a curiosity, in fact. We shall report later.

SUPPOSE we should stuff our stomachs with food, the same as some dairymen do those of their cows in order to secure large milk flows, what would be the result?

EGGS are now going up in price. They will increase in price till Christmas. What treatment are the hens receiving now? The increased price will make no difference with your profits unless you take care of the hens.

SUPPOSE you spend half a day in putting an acre of wheat land is first-rate order, and that acre yields two bushels of grain more than the rest of the field, do you lose or gain by the extra work? If you gain, why not treat every acre in the same way?

THE Angel of Midnight Corn, sent out in the RURAL'S last Seed Distribution, has done well with us, though requiring a longer season to mature than last year. It is certainly one of the most productive strains of yellow flint known to us.

DON'T say because wood ashes produce fine results on your land that they are the best of all manures. Don't say because they show no effects they are worthless. In the one case, your land may be rich in phosphoric acid and nitrogen, needing chiefly potash—in the other rich in potash.

DR. R. P. GREENLEAF, of Delaware, sends us the first bunch of grapes we have seen from the Niagara seed sent out several years ago in the RURAL'S Seed Distribution. The berry is much the color and shape and size of its parent. In quality it is more meaty (less pulp), the skin is firm and we can not detect any foxiness. Dr. G. says the vine is vigorous.

THE Rural Blush is yielding heavily at the R. G. The season has been favorable, it is true, for late potatoes. The Blush is not the best shaped potato in the world and, as we have often said, the tubers do not grow closely together. Still its quality equals that of the best of the Peachblows. Wait until we distribute the RURAL NEW-YORKER No. 2 among our subscribers!

Do you attend the fair to learn all you can, or do you go merely for amusement? How easy it is to distinguish the one from the other. The farmer who aims to improve his methods and to raise better crops will find something in everything to examine and inquire about. The farmer who views farm life as merely a routine of drudgery will be found gaping in front of a fortune-wheel or idly gazing at the horse trot.

MR. H. M. C. GARDNER has the thanks of the ladies of this office for a huge bunch of Golden Rod blossoms. These bright masses of gold are very popular with city people. Whenever they make a visit to the country at this season, they are sure to return laden with bunches of Golden Rod. Even the farmer, who is bound to look upon it as an agricultural enemy, is often forced into an expression of admiration as he sees it nodding merrily over his fields.

WOULD you have a bed of pansies bloom during the entire Summer? And would you have the flowers nearly as large in midsummer as in early Spring or Fall? We have succeeded in this way: The soil of the bed was enriched with old manure and chemical fertilizer (bone, blood and potash), and kept moist all the while. If the plants suffer for water for even a day or so, the blooms grow small and do not recover their size in several weeks. The newer strains of pansies—lilac, red, red and yellow, bronze and black—are very beautiful.

THE busiest men in the world just now are the market gardeners. They are having a close race with the frost. Tons of vegetables and melons are ready to be brought into the market. These would be utterly destroyed by heavy frost. There is little sleep for the market gardener these nights. The roads are crowded with teams. The wagons are loaded so heavily that the horses can just about pull them on level ground. Teams are stationed at the foot of each bad hill, which, for a small sum, will help haul the load to the top.

We are sending specimens of the R. N.-Y. to some of our old subscribers who are not subscribers now. We respectfully call their attention to our proposition to send the Rural from now until the end of next year for $2.00, or in Clubs of Five or over for $1.50. We invite them to send for our new 16-page Premium List, which, it will be conceded, offers very liberal compensation to all who are willing to aid in extending the Rural's circulation.

Indust'l Societies.

AMERICAN HORTICULTURAL SOCIETY AT CLEVELAND.

(RURAL SPECIAL REPORT.)

The old and new name; slim attendance; the "Horticultural State"; grapes therein; a mischievous practice; discussion on varieties of grapes; grapes in the South, and elsewhere; fruit growing in Florida; "the whole field of horticulture"; forestry.

SEVEN years ago the Mississippi Valley Horticultural Society was organized by leading fruit growers, horticultural writers and scientists from 20 States. At its New Orleans meeting during the Exposition, the members became imbued with the ambitious, broad and national spirit then prevailing, and changed the society name to "The American Horticultural Society." The first meeting under the new name opened at Cleveland, Ohio, September 7, and the sessions extended through four days. The attendance was not large owing to the detention of members at fairs and openings of agricultural colleges, and the refusal of railway managers to make any reduction in rates. About half the States were represented, however, and valuable papers were read from leading members in numerous other States. Ontario, Canada, had a representative and Kizo Tamari of Japan, was present.

President Parker Earle presided at all the meetings with his usual ability and grace. Secretary Ragan presented the financial status of the society, which showed a balance of $173.12 on the right side. He then read a paper on "The past, present and future of grape culture in California," by Geo. Husmann, of that State. He thinks California is pre-eminently the horticultural State of the Union, as fruits of the temperate zone flourish side by side with those of the tropics. From an experience of five years there he gives a brief outline of grape culture in that State since 1847, when the Mission Grape was the only variety known there. Now he says they have nearly 400 sorts, and expect to produce 20,000,000 gallons of wine this year, equal in quality to any on the globe. "Our raisins are competing with the finest London 'layers;' our table grapes go to every city in the Union, and our grape brandy competes with the choicest French cognacs. We have the best climate under the sun to produce a perfect product; have learned all about location, soil, varieties; can handle the product better, have fewer diseases, and we can furnish the world with better and cheaper wines, raisins, table grapes and brandies than any other country, while our area for successful production is larger than that of France. Good grape land is worth $50 to $100 per acre, and can be brought to bear for $100 per acre more. Then five tons of grapes per acre, at $20 per ton, $20 per acre for cultivation annually. I believe in 10 years our production will be doubled." He refers deprecatingly to the practice of selling the best sorts under foreign labels and the poorest as California fruit, which has resulted advantageously to France and Germany to the injustice and expense of California. The growers hail from all countries, even to the Chinese, who, the writer says, have had a larger share in this grape progress than they are usually credited with.

A discussion of the paper and varieties in general followed. Mr. Green, New York, saw how cheap Chinese labor enabled California growers to compete with producers of the East, notwithstanding high freights. Mr. Miller, Penn., thought Worden superior to Concord, from one year's trial. He asked Mr. Hubbard concerning a tendency to drop from the stem. Mr. Hubbard said all reports were to the contrary. He had visited the original vine on Mr. Worden's place, which had produced 110 pounds of grapes annually for three years past. The present crop was the finest he ever saw. Worden is larger, handsomer than Concord, a week to ten days earlier: quality of a first-class Concord; no rot. Mr. Hollister, Mo., reported a very short grape crop in that State, fruit rotting badly. He condemned practice of selling unripe grapes to get high prices early. Mr. Albaugh, O., cited a case in Montgomery Co., where oats were sown between vineyard rows, and prevented rot. Dr. McKay, Miss., said it was a poor grape year there. Concord did best, and was generally regarded as the safest to plant between the 30th and 35th degrees of latitude. Scuppernong never failed, but was not good for market. Excessive rains for thirty days had caused much rot. Mr. Miller had found sulphate of iron a preventive of rot. Mr. Lindsay, N. C., spoke of the increase of grape culture in his State. The eastern section is the home of the Scuppernong, one vine often covering three acres. Seventy-five varieties bunch grapes grown in the middle section, where the finest grapes in the country are raised. Ives and Champion pay best. We call Worden the best black grape. Mr. Vandeyman, Kan., reports a good grape crop. He had visited many vineyards in Texas and Arkansas, and found fair crops in spite of the drought. He alluded to the noble work of Mr. Munson, of Texas, who is sowing seeds of wildings, and crossing seedlings with the best cultivated sorts. Some wild bunches there are one foot long, and the grapes are fine. President Earle said: "We have no more useful man in the interest of horticulture than Mr. T. V. Munson." Most of the members seemed to agree with him.

Mr. Geo. W. Campbell, Ohio, said: "In Central Ohio this is the best grape season since 1849. Early and late sorts are ripening near together. The Talman colors early, but it is an abomination. I was one of the first to raise Worden in Ohio. It is larger than Concord, juicier, ripens earlier, but it has all the faults of that kind, tender skin, a poor shipper." Mr. Carpenter, Ohio, thought high culture gave better grapes and prevented rot. Mr. Tarmari, of Japan, who since the World's Exposition has been studying American horticulture at Lansing, Mich., and other points, then made a few remarks. His people are beginning to grow American grapes. "We had no wine until our country was opened; the Chinese had raised wine grapes for many years. Now we shall have wine, too. There are only two varieties of native grapes in my country. We live so much on vegetable food, eating grapes at table was never thought of." Mr. Tarmari is an intelligent gentleman, but he still finds it difficult to express himself fluently in English, and his pronunciation is very odd.

President Earle then read a paper on Florida Horticulture, by E. H. Hart of Federal Point. He spoke in glowing terms of the climate, and said scientists had immigrated there in large numbers, but as yet science had done little for them. "All we can boast of is profuse vegetation. The fascinations of orange culture have caused the neglect of other fruits. There are wonderful possibilities in the way of landscape gardening in our State. There is no reason why cut flowers cannot be grown in Florida for Northern markets at a good profit. The effects of last Winter's frost have been obliterated by the copious rains of the Summer."

At the first evening session, President Earle read his annual address, an excellent, comprehensive, and practical paper, covering the whole field of horticulture. He said the home, the farm, the garden, and the park were now embraced under this head. "There is an æsthetic and an economic side to it," and he could not tell which had developed most in late years. Horticulture co-operates with education, religion, and moral culture. All honor to those who have made our country the most fruitful and flowerful under the sun. Thirty years ago the strawberries of the Chicago market could have been carried in a wagon; now they require immense railway trains; 300 to 600 tons of the fruit come in daily, and over a quarter of a million persons are engaged in the harvest. He contrasted the poor, little flower-bed half hidden in the farmer's yard, and the spikes of hollyhock at the front door in years gone by, with the embowered mansions and cottages of the present day. Alluding to complaints of over-production of fruit, he regarded the evil as resulting rather from imperfect distribution. "We are marketing too poorly, and there is no obstacle in the way which may not be overcome. We should know more of fruit culture in Russia and Asia." He spoke with great earnestness on the forestry question. "Without forests no successful agriculture is possible, and no high civilization can be maintained. Every year of timber waste makes the matter worse. Seasons change; destructive floods are followed by consuming droughts. The forces of Nature are unbalanced. In 1853 the State of Ohio had 54 per cent. of its surface covered with forest; in 1884 only 17 per cent. remained. Do you wonder at the inundations, the harder Winters, hotter and drier summers; or at the absence of the sparkling brooks that ran and sang all Summer? I quail before the inexorable penalties Nature has in store for all States and peoples who will ruthlessly destroy so glorious a heritage of forest as the American people once possessed. Our woodlands should be preserved by absolute force where the government has the right, and by all encouraging legislation where it has no control." The paper was long and the above sentences are selected at random. It was loudly applauded, and 2,000 copies were ordered printed in pamphlet form. H. H.

THE ILLINOIS STATE FAIR.

(RURAL SPECIAL REPORT.)

Entries and attendance good; Children's Day; live stock; other exhibits; new officers; evidences of progress in manufacture and adaptation of machinery.

THE 34th annual State Fair of Illinois was held at Chicago, September 6 to 10, 1886. The entries exceeded those of former years in number and in quantity of live stock. The attendance was very large, especially from the territory tributary to Chicago. Expenses were met. The premiums offered amounted to more than $34,000; nearly half of which was for horses, but more for speed than anything else. Why is it that fairs must encourage gambling while important objects of agriculture are in proportion discouraged? The weather was propitious most of the time. There were the usual number of swindling peddlers and abominable restaurants. There were on exhibition 879 horses, 258 cattle, 510 swine, and 489 sheep.

Tuesday was Children's Day, when the children of Cook County schools were admitted free. About 20,000 attended. Had not the children of the entire State equal rights of free admission with those of Cook County? Wednesday there was an industrial parade, led by prominent dignitaries in carriages. The effect was very imposing. Thursday was Citizens' Day, and horse-racing was the chief feature. Over 40,000 persons were present.

The principal exhibit of horses was of Percherons. They were housed in a structure made of baled hay, representing a French castle of the fourteenth century. France gave 5,000 francs to the Percherons, and had with Canada and the United States special judges. England gave £200 to the Shire horses. The British Clydesdale Association gave medals for Clydes. The cattle display included all the principal breeds. The horses and cattle exhibited at the Columbus, O., and Minneapolis, Minn., fairs were brought here. The excellent display of animals brought together buyers from many parts of the United States, Canada and Europe. Sheep and swine were present in large numbers and revealed a high state of breeding. The poultry exhibits were meritorious.

Agricultural produce gave an idea of the fertility of Western soil. Agricultural implements were fully represented. There were numerous instructive and interesting contests presented between the latest improved machines and their predecessors. Flowers and the fine arts were fairly represented. There were numerous meritorious exhibits in the "educational" department, in which the country schools were not far behind the city in certain lines of study and work.

Samuel Dysart, of Franklin Grove, Lee County, was elected President of the Illinois State Board of Agriculture. Vice-Presidents were elected from each of the 20 congressional districts in Illinois. Charles F. Mills, of Springfield, was elected Secretary *pro tem.* He and Mr. Bunn, Treasurer, will probably be re-elected by the Board. There is a movement on foot to secure permanent grounds for the State Fair to be held at Chicago. There should be better facilities for reaching and leaving the grounds. The next great event concerning the cattle interest will be the American Fat Stock Show, at Chicago, Nov. 8-19, 1886.

The exhibits at the Illinois State Fair show the progress made in various lines of agriculture. For example, implements:—There is a tendency to abandon the arbitrary sizes, and to make large or small machines for intensive or "ten-acre" farmers. Steel is being much used for the passive parts of machines, superseding wood and iron. The weight is less and the articles are not so bulky and cumbersome. Side-drafts are being avoided. Prominent features are fewer parts, simpler connecting mechanism, direct transmission of power, and more positive action. Dodging patents and seeking novelty have resulted in many variations, some of which are not especially noteworthy or valuable. There have been some improvements in harvesting machines. Needless parts have been done away with, defective actions remedied, and arrangements made for folding the parts together on the road. The reel is under better control. The driver has better direction of his machine, some wheels having been adopted in the place of levers. The sickle is now more easily actuated. Feed grinders are very popular subjects of invention. In them there are improvements in applying power and greater compactness. Riding-plows are more easily turned, and improved mold-boards are presented for sticky soils. For planters greater ease of manipulation and more reliable action are claimed. Hay machines are being made to increase the speed and ease of handling larger quantities of hay. Ensilage and chopped feed seem to be popular, as many machines are made for them. Windmills are being adapted for the lighter purposes of the dairy, household and work-shop. It is to be hoped they will be made so that they will be good for something in a breeze something less than a gale. T. G. LAMOILLE.

SOCIETY NOTES.

HON. GEO. B. LORING at the New England Fair criticized the use of the word thoroughbred in fair catalogues and herd books. Thoroughbred applies to a race of horses bred in England for speed. A thoroughbred pig would be an impossibility. Animals are pure bred, but not necessarily thoroughbred.

AT the New England Fair classes were made for grade Jerseys and grade Ayrshires. The design was to encourage dairy cattle. After some discussion all other grades were admitted into the class for grade Ayrshires. The idea expressed was that every cow that gives milk is to a certain extent a dairy animal.

THE old fashioned "town team" is still exhibited at many fairs. As many of the oxen of the town as can be had are hitched together and walked around the track where all can see and compare them. In many parts of the West a yoke of cattle is a great curiosity. On many New England farms an ox earns his living and pays a profit by his work while he is growing into beef. The fact that so much of the work on New England farms is still done by oxen explains why it is that the Hereford cattle are so well represented at the fairs. These cattle are large and strong and always well mated.

THE Elmira Farmer's Club discussed the use of rock salt for salting cattle. It was thought that a piece weighing 80 pounds placed on boards, stones or any other dry support would be a sufficient supply for 10 or 12 cattle through the entire season at pasture. It should not be placed on the ground.

BULB prizes are offered by the General Union of Holland through the Massachusetts Horticultural Society. The prizes are for spring flowering bulbs, and the exhibition will take place about March 23, 1887. The prizes consist of nine medals and $221.

PROF. W. A. HENRY of Wisconsin told the members of the California State Horticultural Society that there would be a large consumption of California fruit in Wisconsin if good fruit could be sent at a reasonable price. The poor stuff which is now often sent, does not commend itself. So long as farmers have to pay all they can get for a bushel of potatoes or a pound of fruit, they will not be apt to buy much. California fruit growers have had this story told them pretty often of late.

THE Atlanta Pomological Society is doing an excellent work for Georgia and the South. Meetings are held weekly. Discussions and exhibitions of fruits are held.

DUST was the one great objection at the Ohio State Fair. The exhibition was the most successful ever held in Ohio, It was worthy of the most remarkable state in the West. Thousands attended. The live stock exhibition was fine. The Ohio Farmer gives the number of animals exhibited as 73 draft horses, 336 cattle, 597 sheep and 361 swine. There were 75 Short-horns, 38 Herefords, 19 Red Polls, 25 Aberdeen-Angus, 24 Holsteins, 61 Devons, 42 Ayrshires, and 52 Jerseys, 184 fine-wool sheep, 71 Black Top and delaine Merinos, 114 Shropshires, 45 Oxford Downs, 43 South Downs and 50 Long Wools and 138 Poland-China hogs, 88 Chester Whites, 90 Berkshires and 51 Duroc-Jerseys. About every implement known to agriculture was on exhibition and some new implements made a sensation.

THE show of horses at the New England fair was the finest ever seen in Maine. Draft horses, trotters and roadsters were all represented. It is expected that this fine display will tend to stimulate horse raising in New England as never before.

FROM the cattle exhibits at the New England fair it was evident that Hereford, Short-

horn and Holstein cattle are rapidly growing in favor in New England, that some of the finest Jerseys are to be found in Maine, that Ayrshires make friends wherever they go, that Swiss cattle are becoming popular and that breeders of Devons do not seem to care much about pushing their stock to the front.

THE Livingston Co., N. Y., fair will be held at Geneseo, Oct. 6 and 7. The Premium List contains extracts from the State laws, relating to the protection of property at fairs. The powers of the managers as to the appointment of policemen and the preservation of property are clearly defined. It is well to have such matters understood.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

J. T. LOVETT, LITTLE SILVER, MONMOUTH Co., N. J.—A circular of the new blackberry "Erie," and of the new strawberry "Monmouth." We are trying the Erie, but can't report as yet. It is highly praised by a number of trustworthy fruit growers who have fruited it.

ELLWANGER & BARRY, ROCHESTER, N. Y.—A descriptive catalogue of select roses. Ellwanger & Barry have had under trial many new varieties since the last edition of this catalogue was issued one year ago, but their experience, thus far, does not justify them in placing them in the catalogue. Only one vaety has been added, viz.: Her Majesty, and she has not behaved very well. This variety, with W. F. Bennet, American Beauty and The Bride was ordered from several different firms in the Spring, but except The Bride, they are either dead or have made very little growth. The Bride has done fairly well and its beautiful flowers except color are much the same as Mermet, of which it is a sport. The flowers are white, sometimes rose-tinted on the outer petals.

NINETEENTH Annual Report of the Ohio State Horticultural Society, G. W. Campbell, Secretary, Delaware, O. The report contains 240 pages and we hope to refer to it again.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

A RETROSPECT.

"It is fair as the flush of dawn," he said,
"And sweet as the breath of May:
But so slight a part of the day has fled,
And roses will bloom along the way—
Will not gather this dew-kissed flower
To fade in the noontide's heat,
I will wait awhile—another hour—
Time flieth all too fleet.
I will wait till the burden of day has passed,
And evening's cool shadows come at last;
Then will I gather a fairer rose,
Than any that in this garden grows."

So he journeyed lilly all the day,
His path was hedged with the ripening grain:
Soft and low, from the distant way,
Came the reaper's faint refrain.
But the sun went down in a blackening cloud,
And the wind blew shrill and cold.
The frail earth shook with the thunder loud,
And the lightning's flash grew bold.
He hurried on to the dim dark wood,
Where the swaying, storm tossed monarchs stood;
But he feared in their gloomy depths to stay
So turned him backward on his way.

He wandered backward—but glanced behind
In doubt to go—yet loth to stay,
It seemed to him that the shrilling wind
Mockingly whispered "Which way?"
He thought of the rose, so fair and sweet;
"I will gather its fragrance yet," he said;
And hastened backward with fool-steps fleet
O'er the path where so late they had fled.
But the rose was gone!—its petals lay
Tossed and torn by the wind-sprite's play,
And never more, through the sun or rain,
Will its frail sweet beauty bloom again.

—*France E. Daly, in San Francisco New Age.*

OF INTEREST TO WOMEN.

THE opal is again to be a fashionable stone, according to the jewelers.

Fashion says that the coming ear-ring is an immense ball of rough gold, either plain or with jewels sunk deep in the metal. They are said to be almost as large as tennis balls, rather a Fiji Island idea.

Apparently the plain coat sleeve will not continue to enjoy its monopoly, since dressmakers abroad are trimming elaborately from the shoulder to the elbow. Still, the woman who knows that she has a pretty arm will be reluctant to disguise it.

Since the servants of a Pennsylvania town have formed into a protective union, they decline to enter a family where they are expected to wash or iron, and in few cases will one girl undertake the work of a family. The next thing will be a mistresses protective association, and if they always decline to hire a girl who cannot show a good character from a former employer, make arrangement about breakages, and rigidly insist on the month's notice before leaving, they may do some good to the down-trodden mistresses.

The Czarina of all the Russians is a model to many housewives. The Chicago Times says: "She rises early, and, though most dainty and fastidious in all her toilet arrangements, is always ready at 10 o clock. Mass is said at 11 and breakfast is served at 12. Her Majesty does not affect *robes de chambre* nor *deshabilles*, but has adopted for morning wear the simple costumes of fine cloth or wool *a la Anglaise*, with narrow collar and cuffs. Her beautiful hair, silky and shining, always exquisitely arranged, completes her daily toilet, so thoroughly 'neat,' with that freshness which is so much admired in the English household of the Princess of Wales. The Emperor declares that there is not another woman in the world who so thoroughly understands the art of dress."

LETTING THINGS SLIDE.

FROM ANOTHER STANDPOINT.

"THE philosophy of letting things slide! That sounds well enough, but when one woman has to cook, sweep and dust, help the children with their lessons, and start them off to school, make new gowns and make over old ones, mend, and wash dishes, and tie up cut fingers, while she entertains guests, assists her husband in his business, and tries to do her duty to the needy in between times—what in the world is she to let slide? She bids fair to realize Mrs. Gargery's description, 'a slave as never has her apron off.'"

This half-querulous plaint would express the inmost feelings of many a tired housewife, if she could ever find time to put her ideas down in black and white. What should we let slide? That is the question agitating many an overworked woman.

We are so often told of the wonders in the way of house-work accomplished by our grandmothers—how they baked and spun and wove; carded wool, and made their husbands' clothes, and brought up great families of sturdy sons and daughters. But there were but 24 hours in a day, then as now, and it is our deeply rooted conviction that our grandmothers did not really work harder than we do; they must have let something slide, and we should do the same. What to leave undone each woman must decide for herself. To a woman carefully trained, with the good-housekeeper-instinct ingrained in every fibre of her being, it is often absolute misery to leave undone the things she ought to have done. The very idea of letting things slide brings to her indignant lips the one word, "shiftless," and there is no severer terms in her lexicon: To be shiftless, to have no "faculty," as they say in New England, is to be a very pariah, and it is exasperating in in some cases—"there is a point beyond which forbearance ceases to be a virtue." But ordinarily there is little doubt that the right way to take life is to take it easy. We must do our duty, to the full extent of our power, but we need not create imaginary duties that are in reality superfluities. It was a great, though obscure philosopher who said, "give me the luxuries of life and I care nothing for the necessities" We fear too many of us hold similar opinions, though we may not so frankly avow them.

So, too busy housewife, let the luxuries slide, and only work for the necessities. Of course you will regard mental and moral culture as a necessity. Iron and stitch fewer frills, make less pastry and preserves, if you will, but cultivate the finer graces of mind and heart with and for your children. And, let me whisper, if you are bent on frills and furbelows, indulge in them for yourself as well as your little girls. Let them always remember mother's pretty gowns and pretty ways, and wisely neglecting the needless worries of a household. Keep a bright faith and a bright heart for the trials you cannot let slide.

SEPTEMBER.

OH these glorious golden days! They make one's heart throb with gladness and carry one's memory back to the days of youth, when hope and joyful anticipations of a glad coming time in the near future would gild the lifelong day with happiness.

How many of these golden dreams have been realized? We look back through the vista of long years and think of the days when we gathered the lovely golden rod, the blooming asters and the purple live-forever, and thought how life would be one glad era of brightness and joy; We wove webs of fairy texture in which to clothe ourselves, and built castles in the air, that long since have been demolished by stern reality. Youth is always hopeful and joyous. It is pleasant to look back to the glad days when we stood on the verge of womanhood, never doubting the bright prospects that our fancy had pictured as the one we should tread through life. We never thought then of thorns piercing our feet or briers wounding our hands, or worse troubles piercing our hearts. The lovely September days were emblematic of our bright hereafter. So we left girlhood behind us and assumed the new duties and responsibilities of wifehood. Never regret the past that cannot be recalled; but how many of the wives and mothers of the last decade would have ventured into the wedded state could they have looked forward and seen with a truthful eye the cares, sorrows and vicissitudes of the life to come, that was mapped out before them? They would have shrunk back in consternation, and if they had advanced it would have been with fear and trembling.

But the hearts of the young are ever hopeful. They know their mothers and their aunts have seen hardships; their life has been a struggle between grief and sickness; they have seen their friends fade and fall like the September leaves, but surely their road will be smoother: a kind, loving hand will make their path easy. They will not have such a tedious journey. The sunlight will always shine on them: the dark shadows will fall on some other less favored ones. And so they press on. The bright September sun of life very soon gives way to the rough equinoctial storms; the frosts of October are quickly followed by the winds of bleak November and the blasts of a cold dreary Winter. Such is life! Brightness and sunshine cannot linger forever; but it is pleasant to enjoy them as they pass along, and their memory is very pleasant as we look back through the corridors of Time. As our heads become sprinkled with the frosts of years the reminiscences of bygone days are pleasant, but very sad. We recall faces and forms of loved ones that have passed away; been gathered into the great storehouse of the dread Harvester. S. H. R.

KITCHEN WORK.

THERE is no work in life where the old adage, "Whatever is worth doing at all is worth doing well," is more applicable than it is in the kitchen. Did you ever turn your kitchen over to the undisputed reign of a servant for a few weeks? If so, did you recognize it after that reign was over? I remember once moving into a house whose last occupant was a lady who kept two servants, and who had the name of never going into her kitchen. One glance at the floor convinced me that her name was not undeserved, and I could not help thinking that if it had been mine I should have either wanted to keep out of it altogether, or else—I should have wanted to clean it. As it was, I did not trust its renovation to other hands, and, although I am not fond of scrubbing, I experienced unalloyed satisfaction in my work after it was done.

Of course, when one takes a servant from among the lowest Irish peasantry, one does not expect to find a neat and trained housekeeper, but I have had girls from American families, whose mothers were noted housewives, who were lamentably ignorant of all housewifely ways. My last experience was with a bright, pretty girl of eighteen, from a home where thrift and good housekeeping are not strangers. Her first task was to wash the dinner dishes. She clattered the greasy plates with fragments of food into the dish-pan, together with the spoons and silver forks, and poured boiling water over the whole. The result was a thick, greasy scum with rinds and crusts bobbing in it—a mess that looked fit only for the swill-pail. The girl was intelligent and willing to learn and I did not have to tell her twice about the proper way of doing a thing; she had simply been neglected by her mother. There are so many mothers who, from a mistaken idea of what is for their daughters' best interests, give them a few lessons on the piano or in painting, or some other accomplishment of which they can only get a smattering, and which will only serve to call attention to their ignorance. If mothers would believe it, their daughters will be happier women, and better wives and mothers for being first, good housekeepers; after that if there is time and money to spare, let them learn music or painting, or anything they or you may desire, but see to it first of all, and above all, that they are good housekeepers. If it is any comfort to you, you may remember that all of Queen Victoria's daughters are famous for their skill in housewifery, and in everything that pertains to the duties of a wife and mother. A MOTHER.

GOLDEN GRAINS.

COLERIDGE says: "Common sense in an uncommon degree is what the world calls wisdom".....

How often we are reminded when looking over current literature of Clark's words. Multitudes of words, he says "are neither an argument of clear ideas in the writer, nor a proper means of conveying clear notions to the reader".....

SOUTH says: "Frequent consideration of a thing wears off the strangeness of it, and shows it in its several lights and various ways of appearance to the view of the mind".....

NEWTON always looks on the bright side, he says: "Trials are medicines which the Great Physician prescribes because we need them. Then, let us trust in His skill, and thank Him for His prescription".....

LET the day have a blessed baptism by giving your waking thoughts into the bosom of God. The first hour of the morning is the rudder of the day.....

WALK as if you were conscious that your body has a soul in it.....

HUME, the historian, has left on record his opinion that the disposition to look on the bright side of things, and to make the best of everything that is good is equivalent to a large fortune to its happy possessor.....

KNOWLEDGE must be earned; it cannot be passively taken. Unless the mind works for its living it will always remain poor; neither gifts nor legacies, neither houses nor lands can enrich it .....

A MAN started out for church one icy Sunday morning, and presently came to a place where a little boy was standing, who, with choking voice, said: "Please don't step there." "Why not?" "Because I stepped there and fell down," sobbed the little fellow, who had thus taken upon himself to warn the unwary passer by of the danger into which he had fallen.. .....

IT is well for us to be warned by the sad experience of others, and it is sometimes a duty for those who have fallen by these temptations to lift a warning voice. There are slippery places all around us, and thousands are passing heedlessly along. Let us entreat them to beware, and, as we remember the bitter experiences of our own sinful lives, let us say to those who are just yielding to such temptations, "Don't step there, for I stepped there and fell down."

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

SUGGESTIONS.

LAY in a store of quince jelly.

Take care of your teeth—it pays.

Avoid whispering in a sick room.

This is to be another velvet season.

Discourage your children in candy and nut eating. Let them buy fruit instead.

A hop pillow will often induce sleep.

In spite of all that is said about thoughtless daughters and over-worked mothers, it is, nine cases out of ten, the mother's fault that the daughters do not relieve her of her cares.

A feverish person can often be quieted by first rubbing the body with a coarse towel, and afterward with alcohol.

Fancy-work is fascinating, but my dear girl, don't allow yourself to study out that pattern for shell lace, until you have darned the drawerful of stockings that have been gathering from week to week, in spite of the oft-repeated conscience quieter: "I'll mend them to-morrow."

A neighbor tells us that black currants lose their disagreeable aroma in cooking, and that as a canned fruit they are simply delicious.

A SEPTEMBER MENU.

Scotch Broth.
Roasted Chicken with a border of Rice.
Sweet Potatoes. Lima Beans.
Cucumber and Onion Salad.
Peach Meringue.

A good, wholesome soup, not too heavy for a September dinner, is made from two pounds of knuckle of veal, two onions, four ounces of lean ham (not smoked), one turnip and a bunch of parsley, with half a cup of barley. Soak the latter for several hours in enough milk to cover it, and put it over the fire together with the meat and bones and two quarts of water. Simmer slowly for three hours, add the vegetables that have been cut into dice and parboiled. Cook for another hour; pick out the meat and bones, skim off the fat, if any, pour into the tureen and serve.

When you buy the knuckle of veal for the above soup, bargain also with your butcher for a sweetbread or a pair of them. Trim off the skin and fat and boil it in water containing a small onion, a few sprigs of parsley and salt; boil for 20 minutes, and then blanch it by dropping in cold water. The livers of the chickens should have been boiled at the same time; chop all together until very fine, and mix with half the quantity of bread crumbs. Clean a pair of chickens and fill them with this force-meat seasoned to taste. Lay them in a baking-pan, and cover the breasts with thin slices of salt pork secured to the skin of the

fowls with small skewers; dust with pepper and pour a cupful of hot water over them; roast about an hour, basting frequently; take off the pork and lay it in the pan; dust the chickens with flour, and as this browns baste with melted butter, and twice again with the gravy. Lay the birds on a hot dish, skim and thicken the gravy (if any thickening is necessary); make a mound of boiled rice; lay the chickens on it, pour over them some of the gravy and send the rest to table in a boat.

Lima beans are never so good as in September, and there is not so much secret in cooking them as in buying or picking them—they should be young, and if possible of the variety called "Dreer's Improved." Parboil them and do not add any salt until they are done; have them nearly dry; add a little hot cream or good milk, a generous lump of butter and some pepper; serve very hot, as they cool quickly.

Browned sweet potatoes cooked after a recipe given some time since in the RURAL, should accompany this dinner.

Slice cucumbers and onions in the proportion of about one of the latter to three of the former; let them lie in salted cold water for an hour, and season with vinegar, pepper and salt; oil may be used if liked.

Pare, stone and halve enough ripe peaches to make a close, thick layer in a deep pie-dish; scald a pint of milk, and stir in two even tablespoonfuls of corn-starch wet with cold milk; as soon as it thickens take it from the fire; add a tablespoonful of butter. When this is luke-warm add the beaten yelks of five eggs, well whipped with half a cup of powdered sugar. Sprinkle the peaches thickly with sugar and pour this custard over them. Bake for ten minutes in a hot oven; spread with a meringue of the whites, whipped stiff with powdered sugar; let it color for one minute and take out. Eat cold with cream, and give thanks for the goods the gods have provided. PALMETTO.

KITCHEN TALK.

ANNIE L. JACK.

"WHAT was the matter with her?" asked the Epicure.

"She was a sacrifice to her slavery to the teapot," answered the Student, and when the Housewife tossed her head in scorn, he added, "Such an inveterate tea drinker must suffer, for those who taste and pack tea are subject to paralysis, and to headache and giddiness. The theine or caffeine varies in different qualities of tea, but is brought out more when it is directly boiled, instead of being simply steeped. Medicinally, tea has been overpraised, and under-rated. It is said to have restorative effects on the nervous system, promoting all vital action. In cases of opium or tartar-emetic poisoning, strong tea is an antidote, and then again, in certain forms of heart disease, it acts injuriously on the pulse, and is unsuitable for those of an irritable constitution. The theine causes intoxication and the subsequent sleep of exhaustion."

"Thank you," said the Housewife; "we shall all feel good when we drink our second cup and know that it has been deluging us with the mysterious 'theine,' but it refreshes and comforts one. Why did Cowper write of 'the cup that cheers yet *not* inebriates,' if there *is* intoxication in it?"

"Oh! he had not been at the trouble to analyze it," said the Student, and the Guest of the House added, "I do think it is harmful, for in Winter, at the afternoon receptions, when people go from house to house and drink strong tea they must suffer for it, even if the baneful effects are not seen all at once. It is a hospitable custom, but carried to excess nowadays."

Then the talk drifted to different methods of tea-making and of cooking and the varied tastes of people in general. During the visit of some guests from different parts of the country, one preferred baker's white bread, another Graham and a third really enjoyed only warm rolls. The same people were as divided in regard to drink, one desiring a beverage of strong tea, which another could not touch, while the third always used cocoa. One cannot eat, any more than breathe, by rule, and it is well to study the taste of a guest; but I often wonder what effect such diverse foods have on the constitution, and what the result would be if one were obliged to eat the food he or she disliked. If an unpalatable breakfast is answerable for the day's sins, how necessary it is that each person should have the food he or she can enjoy and assimilate. Children should be so studied that if their appetites are healthy, they will eat what is set before them. I do not believe in the forcing system of making them eat what is repulsive to them, but in so understanding what they can eat of wholesome food that there will not need to be antagonism in this important matter. Mothers should always remember that tea is injurious to children, and bring them up without expecting that they are to use it.

TABLE MATS.

THIS Summer I crocheted a set of table mats for a friend, I also have a set for myself, which have been in use some time. I make them of No. 12 cotton macremé cord, either white or cream. They are much preferable to any you can buy of straw or slats of wood, and are easily washed when soiled. My own are oblong, but I made two round and three oblong ones for my friend. For the oblong ones I set up a chain of 15, 20, or 30, according to the size—30 for the largest—then work around this in single crochet, widening at each end four stitches in each round, and placing them so the mat will lie flat and smooth. When large enough, I finish off with a fancy edge, then dampen and press very hard and smooth. For round ones, I set up a chain of seven, join, work two stitches in each chain, making 14 inches in the first round, then crochet one in first stitch of second round, two in second, one in third, two in fourth, and so on, making 21 stitches in all. Continue to increase seven stitches in each round, always making two in the last one of the two in one of previous round, until the mat is sufficiently large. Finish off with an edge and press.

A medium-sized bone needle or hook must be used. Work close and firm, taking up both parts of the stitch. AUNT EM.

"A PRETTY PICKLE."

NEVER choose your pickles for their prettiness. A beautiful green pickle may be very pleasing to the eye, but if you are poisoned by it (as you are very apt to be), blame your own false taste that has created a demand for pickles of extreme verdancy, thus forcing the manufacturer to make that which he can sell, in order that he may live, even though he knows that the sale of it, although it may support his own life, will knock the props from under that of his customer. This desired greenness is due to the presence of acetate of copper. The housewife who wishes to put up her own pickles may rely on the following directions and recipes:

Use only a porcelain or granite kettle, and the best cider vinegar. Pickles keep best in glass or hard stoneware. Examine them after a few weeks, and if you find any soft ones, remove them, heat the vinegar scalding hot, with a half pound of sugar for each gallon, and pour it hot over the pickles. If they are keeping well, merely throw in a quarter of a pound of sugar for each gallon, and tie them up again. All well-made pickles are better when they are six months old than at first.

This recipe for East India Pickle was obtained from an old resident of India, and has been used for many years with great satisfaction in my own family. Put in a tall, narrow stone jar two ounces each of curry powder, and mustard, one ounce each of tumeric and garlic; one-and-a-half ounce of ginger, one dram of Cayenne pepper, two ounces of salt, and a quarter of a pound of small onions. The latter should, of course, be skinned. Add to this, a little at a time, two quarts of vinegar; cover the mouth of the jar with a bladder wet with the pickle, and keep it in a warm place by the fire for three days, shaking it several times each day. It is then ready for use, that is for putting in anything that you may wish to pickle; tiny cucumbers, green tomatoes, sprigs of cauliflower, nasturtiums, green beans or grapes; anything, in short, except red cabbage or walnuts. It should stand for two weeks before using, and improves with every year.

An excellent chow-chow is made with very little trouble. Chop four quarts of green tomatoes, two of ripe ones, and one large head of cabbage with three large onions, six large, green peppers, and two ripe peppers, (from which you must take the seeds) as finely as you choose. Sprinkle over them a cupful of salt, and tie up in a coarse cotton bag. Hang where the mass will drain for 24 hours. Put into a kettle with a gill of grated horse-radish, a teaspoonful each of black pepper, ground mustard, white mustard, mace and celery seed, and a pound and half of brown sugar, cover with vinegar and boil until tender and clear.

ONE might write a small book on the subject of making pickles, they are of such infinite variety. The small, silver-skinned onions are especially nice. Remove two layers of skin, when the onions should be perfectly clear; put them into strong brine for three days; bring enough vinegar to cover them to a boil with a few blades of mace and half a dozen small, red Chili peppers. Pour it over the onions while boiling hot.

Pickled Bell Peppers deserve to be more generally known. Cut a slit in the side and take out all the seeds. This should always be done in whatever way they are to be used. Make a brine that will float an egg, and let them soak in it for two days; drain and wash well in cold water. Bring to a boil vinegar with a few sticks of cinnamon, some blades of mace and a teaspoonful of nutmeg and pour it over the peppers. When these are wanted for use stuff them with boiled tongue cut into dice and mixed with a Mayonnaise dressing. They will be a delight to any lunch or dinner table. AUNT ADALIE.

When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

Ayer's Pills

Restore tone and strength to the Stomach and Liver enfeebled by disease, promote the Appetite, and cause the Bowels to move naturally. Ayer's Pills are safe to take, do not debilitate by excessive stimulation, and are not irritating in their action.

I have used Ayer's Pills for twenty years, and can truly say they have always given me satisfaction. Whenever I am troubled with Constipation, or suffer from Loss of Appetite, Ayer's Pills quickly set me right again.—P. N. Ward, Bath, Me.

Ayer's Pills have been my family medicine for fifteen years, and the result of that long experience is a complete vindication of your statements concerning them.—T. T. Nunney, West Point, Tex.

Ayer's Pills,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists and Dealers in Medicine.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

PURE MILK.

WARREN MILK BOTTLES

News of the Week.

HOME NEWS.

SATURDAY, September 18, 1886.

THE Recorder of Montreal decides that the Salvation Army have a right to parade the streets and sing.....The Piute Indians, of Nevada, having lately obtained liquor, are conducting themselves in such manner as to cause great alarm among the whites..... Canadian Wiggins claims to have foretold the earthquakes, and thinks the greatest strain will occur before October 15 .....The skins of seals, etc., caught in Alaskan and other Pacific waters almost all go to London to be handled and dyed. Shipments through this port last week were very heavy, something over 900 casks, making about 20 carloads, having arrived on Thursday and Friday by way of the Pennsylvania Railroad.... ....The Boston Mayflower crossed the winning line 29 minutes nine seconds before the British Galatea, last Saturday, so the America Cup is to remain here. This is the sixth failure of the British to capture the trophy..... .....The first argument in the Government's Bell Telephone suit will be heard at Cincinnati, Monday.....Geronimo with his band, and 400 turbulent Apaches from the San Carlos Reservati n are on their way to Florida, where they will be confined for the present. Fate of Geronimo in doubt. Will probably be tried by military commission, like the Modoc Indians. Many insist that Geronimo, Natchez, and a few other leading men should be hung or shot; but it is hardly likely. Surrender unconditional, except that they were assured that the soldiers never kill "prisoners of war".....The Louisiana Cotton-seed Oil Company, of New Orleans, has joined that monopoly the American Oil Company. Its valuable machinery is to be sent "into the interior" where new factories will be established.....There have been several slight earthquake shocks at Charleston since Saturday; but no additional damage. Experts say much of this is due to the poor materials and faulty construction of the houses. Cash relief amounts to over $320,000, and more coming in. Considerable complaint of idle negroes and "poor whites" who rely on charity rations, and refuse to work. Bricklayers insist on $5 a day, and others in the building trade are equally exacting. Full work for all in patching up houses and rebuilding. What's wanted are loans at low interest to restore fallen and ruptured buildings and start trade. Nothern people are generous with cash and credit. This city alone has contributed over $100,000. Thousands have left the city—most never to return. Free transportation furnised to emigrants. Will take years before the place will recover from the disaster..... ....Canada is determined to levy prohibitory export duties on saw logs. The duty is now $1 to $2 per 1,000 feet, board measure; but it is to be raised to $3 if exportation continues and higher, if necessary, to stop it, as the government has discretionary power in the matter. Canada wants us to take all the lumber we want, but wants to keep for herself all the profits of manufacture.....Some of the officials at Ottawa have blustered a good deal about the seizure of those sealers in Behring Sea; but our Government has heard nothing, officially, about the matter. Canada must act through the English Government in the matter. Seizures made 60 to 120 miles from land. Russia ceded to us the exclusive right to catch fur-bearing animals in the whole region; but had Russia the right to seize vessels more than three miles from land? Canada says we have no right to seize vessels in the Pacific beyond three miles from land, following the indentations of the coast; but in the Atlantic she claims the right to seize vessels within three miles of a line running from headland to headland! .....Another Yankee fisher has been seized. The hearing in the case of the seizure of the David J. Adams, the first of the fishing vessels whose fate is to be decided, was begun in the Vice-Admiralty Court at Halifax, N. S., Thursday ..... Owing to the failure of the Newfoundland fishery this year, great distress is probable during the Winter. It is thought that from 100,000 to 150,000 will need public help to escape starvation—probably an exaggeration... ....There's a great strike of sailors on the Pacific Coast, where labor organizations have lately become very powerful. Between 1,100 and 1,200 men are reported to be idle along the coast, 750 of them in San Francisco. They all belong to coasting vessels, 25 of which are idle in San Francisco, owing to lack of hands; while others have put to sea short-handed. Both sailors and ship owners are resolute..... ....Colored Washingtonians are getting up an exposition of the achievements of the race since the war.....Many prominent Democrats are supporting Republican Governor Rusk for re-election in Wisconsin, because he put down the Anarchist outbreak in Milwaukee with such a prompt and vigorous hand... The New York Stock Exchange, by an overwhelming majority, has refused to allow Georgia State bonds to be sold or quoted in that body, because Georgia, by a constitutional amendment, repudiated $8,000,000 worth of debts contracted in "carpet-bag" days; though some of the bonds sold for as high as 94 cents on the dollar, and the State has ever since enjoyed the benefit of the money. Attorney-General O'Brien has also decided that in this State savings banks cannot invest in such securities .....The liquor interests are fighting "tooth and nail" everywhere in the elections....From latest trustworthy reports it seems all the "terrible excitement" about the "Cutting affair" in Mexico and "down South" was almost exclusively confined to the newspaper offices.....Philadelphia has impeached Mayor Smith for having used public money for his private purposes, and for having allowed dummy policemen to draw pay month after month, the money going "where it would do the most good."....It looks as if the Farmers' Alliances of Minnesota were to join the Democrats to elect Mayor Ames of Minneapolis for Governor, against "railroad monopolies." If Ignatius Donnelly can get enough votes from such an "alliance," he'll be candidate for United States Senate; but the chances are small.....The Democrats swept Arkansas. The Wheelers made a poor show; but most of the members didn't favor separate action.....The Republicans carried Maine by about 14,000 majority over the Democrats and Prohibitionists. The latter made a poor show in the oldest Prohibition State. Blaine spoke and led splendidly.....The canvass for Governor of Tennessee, between Bob. Taylor, Democrat, and his brother Alf., Republican, is very lively, indeed, but quite fraternal—an excellent example for other States and much smaller sections. The real merits of both parties are freely and fully discussed; but there are no "campaign lies" or mud-slinging..... ... .Judging by the legislative nominations, Bayard is still supreme in Delaware. Gray's election to the U. S. Senate is assured..... Frank Lawler, the Chicago rum-selling Congressman, is going back to "Congress's hall." He made himself solid with the big meat-packing firms by opposing the Oleo Bill, and all their men were ordered to vote for him at the primaries.....Fifty people were poisoned at a wedding near Decatur, Ill., the other night by eating chicken cooked in a copper kettle.....The naval inspectors find over 100 American steamships hailing from New York alone, capable of running 14 knots an hour, which would be of service as naval vessels of an inferior order upon an emergency..... .... The first National Convention of Anti-Saloon Republicans at Chicago was largely attended. Its object was to retain in the Republican party as many as possible of those who favor Prohibition and stringent laws regulating the sale of liquor. The results of its efforts must greatly help the cause of temperance. Extreme Prohibitionists, however, are irreconcilable. The Labor party threatens to be to the Democratic party what the Prohibition party is to the Republican.....

FOREIGN NEWS.

SATURDAY, Sept. 18, 1886

IN the English Parliament measures of great national importance are almost invariably introduced by the Government.; when this isn't done, the Government consents to their introduction, and if it refuses consent, and a majority of the House of Commons favor it, the Government is defeated and generally resigns. The other day the Government consented to the introduction of a land bill by Mr. Parnell. The Land Act of 1881 appointed a Court to determine what were fair rents for land, and the landlords had to accept its decision. Leaseholders, however, were excluded from the benefits of the Act. In view of the decline in the prices of agricultural produce since then, Parnell's Bill provides that where the rent was fixed before 1884, if half the rent for 1886 and any antecedent arrears have been paid, and the tenant says he is unable to pay any more, the Land Court must decide what abatement should be made. By section two leaseholders are put on the same footing, as regards rent, as tenants from year to year. Section three provides that wherever proceedings have been begun, the Court shall suspend such proceedings until the tenant shall have the benefit of this act. The rents of hundreds of tenants are due in November, and they say they can't pay them. Most of the landlords are prepared to evict them, and the Government has promised to give military aid in doing so. Eviction is to be resisted by violence. Policemen, troops and all others aiding in the work are to be rigidly boycotted. Men who take the farms of evicted tenants are to receive the harshest treatment. Some of them are killed or maltreated every week. The evicted tenants are advised by their leaders to flock to the work-houses so as to force the landlords to support them, and no disgrace is to attend the act. Imprisonment for resisting eviction is to be considered honorable. On the whole, a turbulent time seems probable in Ireland during the Winter, for there's little or no prospect of the passage of the Parnell Bill which would keep peace in the island.....Tenants in Scotland and Wales are loudly demanding the same terms as those granted to the Irish. How long will English tenants who suffer just as much, keep from joining in the clamor?..... Russia, Germany and Austria seem to have agreed with regard to Bulgaria, and when those three big bullies agree, it's not much use for others to protest. Prince Alexander is hardly likely to return, though the vast majority of Bulgars want him. The Sobranje (Legislature) has just voted a grant of $500,000 to purchase all his property in Bulgaria, retaining $185,000 of it to pay his debts. Very little would be needed to cause a conflagration in Eastern Europe. England and Turkey are more cordial than ever, and both are vigorously preparing for contingencies... ..... Italy is disposed to side strongly with them, and if Germany and Austria go with Russia, it seems that France must join the other coalition. There are reports that Bismarck is to peremptorily demand of France why the Government allows persistent virulence against Germany in the newspapers; and why the French army is constantly increasing its numbers and efficiency. Germany is doing pre-precisely the same with regard to France; but what of that? If the French answer be not satisfactory, the Germans, befriended by Austria, and smiled upon by Russia, are once more to push on to Paris. All the armies of Europe are being equipped as rapidly as possible with the very latest improvements in fire-arms, and it seems impossible that peace can last much longer in the presence of so many causes of bickering and complaint and such multitudes of men trained and kept at enormous expense for the sole purpose of killing each other.....

AGRICULTURAL NEWS.

SATURDAY, Sept. 18, 1886.

ALL the pressmen, stevedores and other workmen handling cotton at New Orleans, some time ago formed a powerful association to regulate hours and wages. The Cotton-Press Association, composed of the owners of most of the cotton presses, managed to join the workingmen's organization, although many of the men objected on the ground that the interests of the employers and the employed must often clash, and could not therefore be represented by one body. There were several presses not in the Cotton-Press Association, which paid the same wages and employed men belonging to the longshoremen's union. The Cotton-Press Association has lately insisted that the men should not work for them. If they had carried their point, the entire business of pressing and shipping cotton in the largest cotton market in the world would be in the hands of a small, selfish monopoly, and the producers and consumers must suffer, while much of the trade would certainly go elsewhere to avoid extortion. It has just been decided by all parties, however, to make no distinction in labor matters between the independent presses and those of the Cotton-Press Association. A lively competition in the cotton pressing business is expected..... ....The Executive Committees of the National Cattlemen's Association of America and the National Horse and Cattle Grower's Association of the United States met at Springfield, Ill., Wednesday, to complete the steps taken last Winter to organize the two bodies into one. Their consolidation was practically effected by arranging the program to be carried out at the Cattle Show at Chicago next month..... ..Californians have lately purchased in Utah and Nevada large quantities of wool, which they shipped by the Central Pacific Road to San Francisco at local rates and re-shipped over the same tracks for Boston at 75 cents per hundred pounds. Owing to railroad discrimination, it would have cost much more to have shipped direct to Boston. .....Here's a sample outrage of Indians in the Northwest—chiefly Canadians raiding across the line: The other day a large flock of sheep which were being driven from Montana into Canada were surrounded by a band of raiders on the Belly River, and urged over its banks until they piled up, one on another, 25 feet deep. In this way 172 sheep were killed, and afterward skinned, cut up, and carried off by the redskins.....Most of the tenants of the O'Flaherty estates near Longford, Ireland, have accepted the offer of their landlord to sell them their holdings at a price equal to the sum of 16 years' rent. As none of the tenants on the O'Flaherty estates have had their rents fixed under the Land Act of 1881, the purchases will be based on the old rents... .....The New Hampshire Agricultural College has seven students.....Wet weather cost the New Jersey State Fair at Waverly, over $6,000, Thursday .....At the Massachusetts Agricultural College 57 applied for admission; 47 were examined, and 37 admitted. The largest class for years.....In New England the established Granges are generally adding to their membership, and new Granges are being established.. .....At the Western National Fair at Bismarck Grove, near Lawrence, Kan., 3,600 bottles of beer were emptied into the Kansas River last Saturday by the Sheriff in the "presence of 500 thirsty people." Those selling beer in violation of the Prohibitory Law were arrested ....Hog cholera reported in several districts of the "Cherokee Nation;" in many localities all the swine have died... .....In Central Indiana the ravages of the disease are very disastrous. Farmer Sheppard of Henry County claims that he has found "parasites or trichinæ," visible to the naked eye, "in the second lining of the stomach" of hogs that had died of the plague, and he thinks these are the cause of it. He expects soon to publish a remedy.....Geo. Wilson, "a well-to-do farmer," living eight miles south of Muncie, Ind., died last Saturday of "a disease contracted while administering medicine to cholera hogs." Doctors say the disease was like hog cholera and that it may become epidemic. The entire southern portion of the county is horror-stricken and many farmers are anxious to sell their farms and go West. Many have left their homes and will not return until the question of epidemic is decided.....A virulent epidemic of hog cholera is now raging along the Kaskaskia or Okaw River, in Champaign County, Illinois, and is chiefly confined to Sadorous township. The loss so far entailed upon the farmers is not less than $12,000.....In the Court of Queen's Bench at Montreal, Thursday, C. H. Cordingley, proprietor of the Commereial Grain and Stock Exchange, a sort of "bucket shop" was found guilty of keeping a common gaming house.....

Crops & Markets.

SATURDAY, Sept. 18, 1886.

The Mark Lane Express, in its weekly review of the British grain trade, says: "Owing to the continued wet weather it will be impossible to make an early delivery of sound native wheats. For this reason the market points to no such big drop in values as was expected during dry weather. The sales of English wheat during the past week were 31,538 quarters at 32s. 5d., against 57,192 quarters at 31s. 1d. during the corresponding week of last year. Foreign wheats were steadied by the bad weather."

The August cotton report of Egypt shows that the condition of the crop is favorable and that the yield promises to exceed that of 1885.

The Agricultural Department's September crop report says the yield of spring wheat is better than was expected a month ago owing to an improvement in Dakota and Wiscousin chiefly. The average yield an acre is 11 bushels, and it may reach 11½. In the South the harvest was disappointing and rains injured the product in the shock. The returns indicate an average yield of about 12⅙ bushels an acre. The entire wheat product will apparently exceed that of last year by 90,000,000 bushels. The Rural's crop Special on July 10, put the excess at 78,000,000, and was blamed by some for putting it so high. The Agricultural Department says there may be a variation of from 5,000,000 to 10,000,000 bushels from its estimate. Corn has declined from 81 in August to 77. The present crop prospect, with no further decline, is 10 per cent. worse than last year, and indicates over 21 bushels an acre, or nearly 1,600,000,000 bushels. The cottou returns show a vigorous condition of the plant, with lateness and deficiency in fruiting. There has been improvement in most of the States, with a decided decline in Texas and a little in Arkansas. With a long and favorable Autumn it indicates an average crop. Yet a decline in condition after this date is usual. The results of thrashing make condition of oats at harvest 91, a small reduction from earlier expectation; barley is 93, an average crop; buckwheat 90. Potatoes have declined from 88.3 to 81.4, from the effects of local drought. In New York the decline is from 97 to 89, and it is heavy in the dry area of the West. Tobacco averages 81. The numbers of fattening hogs are apparently less by about 6 per cent. with some reduction in average weight.

The National Cotton Exchange from New Orleans, says cotton is generally late, and therefore exposed to unfavorable influeuces. General coudition of the crop favorable. No danger yet from worms. Labor plentiful.

From a careful estimate of the broom-corn crop of Douglas County, Ill., which produces a great quantity, the total area planted was about 12,000 acres. The crop this year is heavier and the brush of a finer quality than usual, and about 5,000 tons will be produced, it taking a little over two acres to a ton. The price paid so far is $100 per ton, but as the old crop is entirely disposed of, $150 is likely to be the ruling price. The crop may be safely relied on to bring $600,000 in cash into the county, which is almost the value of the crop of Indian corn.

The Michigan monthly crop report shows the average yield of wheat now thrashed to be 16.18 bushels, indicating a total yield in the State of 26,500,000 bushels. Oats will average 31 bushels; barley 29; winter apples promise 89 per cent. and late peaches 57 per cent. of an average crop.

Telegram from Canajoharie, N. Y., Thursday:—The hop crop of the important counties of New York State, has been harvested, showing the estimate of one-eighth of a yield to fall short. Growers who expected 100 bales get 40, and the quality is exceedingly poor at that.

Up to September 10, receipts of rough rice at New Orleans were 205,850 barrels, against 169,300 barrels at equal date in 1885. Plauters are insisting on higher prices, as domestic rice is better than foreign, while the figures are not proportionately higher. Buyers are unwilling to yield, as the crop is unusually heavy —600,000 barrels. The value of the crop is hardly likely to be established before November or December, by which time the bulk will be in the market, and planters will have decided what to do. They consigned much of the crop last year "all over creation," with very bad results; and this year there is a strong disposition on the part of planters aud factors to sell at home.

An extraordinary rush of wheat to market during the week has depressed the prices of that and other cereals. It has been heaviest from the spring wheat sectiou. Large elevator companies and railroads are said to have done their best to cause it. The outcome has been a further large addition (for the week, 1,906,000 bushels) to what is called the visible supply, bringing the grand aggregate up to 44,872,000 bushels, against 42,248,200 bushels a year ago.

Wool prices are going up; some lines have advanced half a cent from last week. It looks as if fabrics requiring the finer wools would come into fashion. Prices at the Loudon wool sales are very firm—at a higher level than at the last sales. In Bostou fine wool is much stiffer than even a week ago. Quotations there for leading sorts are as follows:

Ohio & Penn. X.....32@33c.	Fine Ohio delaines36@37c.
Ohio & Penn. XX...33@35	No. 1 combing..... 38
Ohio & Penn. XX and above.....35@36	Texas sp'ng,12 mos 23@26
Michigan X.....31@32	Super A.....31@37

The sales of the week have amounted to 5,000,000 pounds, as against 4,900,000 last week, and 7,000,000 for the correspouding week in 1885.

Heavy shipments of corn and an eageruess to realize at once contributed to depress prices.

Oats held their own remarkably well iu the face of the notable weakness and distrust in wheat and corn.

MARKETS BY TELEGRAPH.

SATURDAY, Sept. 18, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 1¾c. lower; No. 2 Spring, 1⅞c. lower. Corn, ⅞c. lower. Oats, ⅝c. lower. Rye, ½c. lower. Barley, ½c. higher. Flaxseed, 1c. higher. Pork, 10c. higher. Mouday pork started at $12 for October option; then fell to $11.25. Armour bid $11 for 10,000 barrels November pork, and only got 5,000. Siuce then prices have been going down. Cattle, from 15c. to 40c. lower, according to grade; some grades steady, others lower; average somewhat lewer. Sheep, natives steadily; Texans, from 40c. to $1.40 lower—poor quality.

WHEAT active.—Wheat easy; Sales ranged; Sept., 74¼@74⅝c; October, 75⅝@76c; November, 77¾@77¾c; May, 81¾c; No 2 Spring, 74½c. CORN—Weak: Cash, 38½c; September, 38⅛@38¾c; October, 39⅝@40c; November, 40¼@41¼c. OATS.—Steady; Sales ranged: Cash, 25¼c; September, 25⅛@25⅜c; October, 26@26⅝c. RYE.—Quiet: No. 2, 48½c. BARLEY. Dull, No. 2, 58c. FLAXSEED.—No. 1, $1 00@1 00¼. MESS PORK.—Sales ranged: Cash, $10 45@10 47½; September, $10 45@10 50; October, $10 35@10 77½; November, $10 20@10 50. LARD.—Steady, Sales ranged: Cash, $7 20 September, $7 20@7 22½; October, 6 25@6 35. Short Ribs.—Steady Cash, $7 85. Boxed Meats.—Dry salted shoulders, $6 12½@6 25; Short clear sides, $7 25@7 30. CATTLE.—Market weak; Shipping steers, $4 25@5 30; stockers and feeders, $2 20@3 70; cows, bulls and mixed $1 50@3 00; bulk, $2 00@2 25; through Texas steers, $2 50@3 45. HOGS.—Rough and mixed, $4 05@4 70; packing and shipping, $4 70@5 05; light weights, $4 00@4 80; skips $2 50@3 75. SHEEP.—Market steady; Natives, $2 00@4 00. Texans, $2 00@3 15; Lambs, $4 00@5 00.

ST. LOUIS.—Compared with cash prices last week, No. 2 Red 1⅝c. lower. Corn, ½c. lower. Oats, steady. Rye, ⅞c. higher. Butter—Creamery, 1c. higher; dairy, 20c. higher for best quality. Eggs, steady. Pork, 25c. higher. Cattle, steady in most grades, higher in some. No grade lower; some higher. Sheep, 15c. lower for best.

WHEAT.—No. 2 Red, Cash, 75@75½c; September, 75c; October, 75⅜@75¾c. CORN.—Strong; No. 2 mixed, Cash, 36@36½c; September, 36¼c; October, 36½c. OATS.—Dull; No. 2 mixed, Cash, 25½@25⅝c; Sept, 25¼c.; October, 25¼c. RYE.—Sept, 49½c. BUTTER.—Creamery, 21@24c; dairy, 10@20c. EGGS, 12c. FLAXSEED.—$1 05. HAY.—Timothy, $10 00; Prairie, $8 00. PORK, $11 25. BULKMEATS.—Long clear, $7 85; short ribs, $7 90; short clear, $7 75. Lard, $6 65. CATTLE.—Good to Choice Native Shipping Steers, $4 35@4 90; Common to Fair, $3 60@4 25; Butchers' Steers, $3 50@4 10; Cows and Heifers, $2 25@3 50; Stockers and Feeders, $3 25@4 00; grass Texans, $2 25@3 60. HOGS.—Market active and firm; heavy, $4 90@5 10, Packing, $4 40@4 85; Lights, $4@4 70. SHEEP.—Market weak at $2 25@3 85.

BOSTON.—APPLES.—The market is over-supplied; Gravensteln, $1 50@2 per bbl; Williams, $1 75@2 25, Porters, $1; Sweets, $1; receipts for the past six days 5,832 bbls; previous six days, 5,467 bbls. BUTTER.—Receipts for the week, 14,304 tubs, 708 boxes, last week, 15,321 tubs, 1,148 boxes. Exports this week, 32,573 lb, last week, 15,961 lb. The receipts of fresh made continue light, and prices for such stock are tending upward. Western imitation creamery and ladle packed are steady. Northerncreamery, extra, 24@24c; extra firsts, 20@ 2c; Western creamery, 22@23c.; do. firsts, 20@21c; do. choice 19@20, dairy, Franklin County finest, 22@23c; good to choice, 19@20c.; Vermont extra 17½@18c; Northern, choice, 16@17c; do. fair to good, 14@15c., Western dairy, good to choice, 12@13c; imitation creamery, extra, 14@15c; ladle-packed, choice 11@12c; do. fair to good, 9@11c. BEANS.—Receipts for the week, 57 bbls; last week, 1,054 bbls. The market well supplied with pea beans, and there continues to be a moderate demand for choice lots. Choice pea, Northern hand picked $1 75@1 85 per bushel; do. do. New York choice, hand-picked, $1 60@1 70, do. do. screened, $1 50@1 55; medium choice, hand-picked, $1 50@1 55; do, choice screened, $1 15@1 20; Yellow Eyes, choice, $1 50@1 50; do. flat, $1 45@1 50; Red Kidneys, $1 75. CHEESE.—Receipts for the week, 6,540 boxes; last week, 5,132 boxes. Exports, 30,035 lbs; last week, 124,622 lbs. The market for cheese made a further advance in rates the past week, but the demand is quiet, and 11c. per lb is an extreme quotation. Liverpool quotations, 48s. New York extra, 10c; do. good to choice, 8½@9½c; do common, 6@8c; Vermont extra, 9½@10c; good to choice, 8@9c; common, 6@8c; Western extra, 10c; do. fine, 7@8c; common, 4@6c. Sage, extra, 10½@11c. HAY AND STRAW.—Receipts this week, 114 cars hay, 48 cars straw; last week, 169 cars hay, 41 cars straw. Market for hay quiet, and prices are fairly steady. Choice, $18@19 per ton; fair, $15@16; ordinary, $14@15; fine, $13@16; Swale hay, $10@11; poor, $10@13 50; Western choice, $13@17; do. fair to good, $13@14 50. Rye straw, $16@17; do. do. machine, $12@14. Oat straw, $8@10. POTATOES.—Demand poor; supply liberal; market easy. Early Rose, 50@63c; Beauty of Hebron, 50@63c; Natives, per bbl., $1 75@2 10. Sweet Potatoes—Virginia Yellow, $1 75@2 50 per bbl; Jersey, $2 75@3.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, September 18, 1886.

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]
Is the only Practical Preventive of the so-called Swine Plague.

If used in proper quantities, it will
1. *Prevent Disease;*
2. *Arrest Disease;*
3. *Pay for itself with the increased pork it will put upon the hogs.*

AS AN EVIDENCE OF FAITH
in my Remedy, I make the following offer:
I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my Remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and neither inbred, close-bred, or the progeny of such.

WHAT IS SAID OF THE REMEDY.
"It has stopped the hogs dying and improved their appetite."—F. C. GOLDSBOROUGH, Easton, Md.
"Have used the remedy with success."—D. G. BARBER, Easton, Md.
This medicine has been thoroughly tested and its merits established on the eastern shore."—Record and Gazette, Pocomoke, Md.
"I will not be without Haas's Hog Remedy if it costs three times the present price."—JOHN CASTIN, Grant City, Mo.
"We would not risk feeding a pen of hogs without the remedy."—WHITE & CO., Gibsonton, Pa.
"I would not think of raising hogs without it."—J. M. ELLSWORTH, Martinsville, Wis.
"It gives satisfaction every time."—J. G. BARTLETT & SON, Suncook, N. H.
"It has never failed to arrest the disease yet."—JONES & MUSSELMAN, St Paris, O.
"I have sold over $2,000 worth, and am pleased to say that it has given good satisfaction."—MELLE WILLIAMS, Druggist, Taylorville, Ill.
The Remedy can be procured of all druggists, or from my Laboratory, upon receipt of price.
Prices, $2.50, $1.25, and 50 cents per package. 25 pound cans, $12.50.

For the Young.

THET TERMATER RAISIN.

BY AUNT SUSAN.

Pap gut his prime termater seed
An' planted 'em right early,
An' tickled half to death he wuz,
Ter see 'em green ez grass.
Fer most of our termaters,
They wuz sorter stunt an' nerly,
An' Pap, he likes termaters
Better'n any kind o' sass.
An' when the nights growed warmer,
An' the frost hed quit a hazin',
Then Pap he set them plants out
Jest ez natrel ez ye please.
An' the children they all wanted
Fer ter try termater raisin';
So Pap, he give 'em all a plant,
Jest so'st they wouldn't tease.

We hed a little pauper
From the County house thet Summer,
Jest a ragged little feller
Doin' chores and runnin' round,
Not much bigger than a corn cob,
But ez spry ez ary hummer;
Pap hed tuck him home to raise him
So'st they couldn't hev him bound.

An' that little pauper feller
Stood around there sorter waitin',
An' his eyes growed mighty wistful
Ez he looked the plantin' o'er.
Pap wuz allus sorter foolish,
Tender-hearted, allus hatin'
Fer ter see folks havin' trouble,
But there wasn't but one plant more,

Thet wuz dredful poor and spindlin',
But the little feller tuck it,
An' he dug a hole an fixed it
Jest ez slick an' clean ez wax.
An' he jest took hold and hoed it,
Carried water in a bucket,
An' he rigged him up a cover
From some pieces of old sacks.

Now the children soon gut tired
An' they quit termater raisin',
An' the weeds growed up an' smothered
All them plants away frum view.
But thet little pauper feller
Stuck to his'n most amazin',
An' it jest beats all my tellin'
How thet plant gut up an' grew.

Pap walked out last Sunday evenin'
Fer ter see how things was growin',
An' thet big termater razin'
Sorter made him stop and think.
An' he shet his eye a minnit,
An' he did look mighty knowin',
An' I couldn't help a seein'
Thet his mind let out a link.

An' he sez "we all git started
Sorter fair in life's big battle,
But it ain't so much the startin',
Ez it is the haugin' to.
Them thet starts out sorter blusterin'
With a mighty noise an' rattle,
Find thet noise won't make no showin'
When they run their journey through.

Take the poorest chance an' work it,
Sorter foster and stay by it,
An' it's sure ter come ter somethin'
Ef ye keep it clean an' bright.
Take the biggest chance agoin'
An' neglect it, and half try it,
It'll spindle down to nothin'."
An' I guess that Pap was right!

ONE of the greatest men we ever had in this country said that no man was ever so ignorant that we could not learn something from him if we tried. He was right. If you watch sharply you will find that every person has some one thing that he can do a little better than anybody else can. Sometimes we can't find it out at once, but when we do find what it is we can learn from him. Be careful about calling people ignorant. The first you know some one who knows a great deal more than you do will come along and show people how little you know. Where will you be then? Never parade your knowledge. It takes many years of study to get enough to parade. Keep quiet and learn all you can.

Almost before we know it we shall have to get ready for Thanksgiving. I hope we shall all have much to be thankful for this year. When we come to figure things up we shall find that we have a great many things that we wouldn't have taken away from us.

We want to make the hens comfortable this Winter. Look out for the houses now, and don't forget to give plenty of food. How would you like to be shut up in a cold room without enough to eat? You are not a hen, to be sure, but you are not as good as a hen if you are cruel to stock of any kind.

SCHOOLS have begun in the city. There are nearly 200,000 children in the New York City schools this term. I went by a school the other day and saw some of the scholars playing about. They had to play in the street or in a little room in the basement. I wonder how our boys and girls would like being cooped up in a little place like that. Not very well, I think. I know that I shouldn't.

IT is a fine thing to be able to write a good report of a meeting of any kind. Such reports are always in demand, and very few people can write them up just as they should be. Our boys and girls can learn to do this work. Begin now. Whenever you go to a meeting of any kind pay close attention to what is said. If you have a piece of paper or a book, write down the things that seem to you good. If you have no book remember all you can of what has been said, and when you get home think it over. This practice will help you. You will be able to pick out the best parts of a sermon or a speech, and people will soon ask you to help them when they want to hold a meeting. Begin with the sermon. Think over what the minister says, remember the text, and when you get home see how much of the sermon you can write down. It will be hard at first, but if you will keep at it, the work will come easier.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

"I am glad to see you" I began. "I hope we shall get along nicely together. You know, and I know just what we have come here for. We are not here simply to have a good time but to try and learn something. I have no doubt there are many things you can teach me. I shall be glad to learn with the rest. There is one thing about studying which I hope you will all remember. Knowledge represents just so much work. We can never learn a thing unless we are willing to work for it. Now a man might stop in here and ask us the right way to town, but I never could put him there. I could show him the way, but unless he made some exertion he never could reach the place."

I noticed a boy sitting on a front seat who seemed greatly interested in my remarks. His mouth was wide open in his excitement, and he tapped his boot on the floor to gain my attention. It seemed to me a good opportunity to stop and point my speech, so I turned to him and said:

"Don't you think that is so?"

"Sposin' ye had a load o'grain or sum hogs ter take ter town. Why couldn't ye hitch up an' carry him?"

He fairly shot these words out of his mouth in his eagerness to explain the ideal educational system of Bear Creek. The rest of the school appeared to agree with him. It was certainly far easier to be carried to town than to walk there, and the same rule would unquestionably apply to studying.

Before I could explain as I wished to do, the door opened with a great flourish and the director strode in. If he had kept away I believe I should have made a much better start. In his great desire to help me out, he precipitated a conflict which lasted during the whole term. He carried a large bundle of sticks under his arm; several of them genuine clubs in size and shape. He handed me this collection with a most dramatic flourish. Then he rapped smartly on the desk and made a long speech in a tremendous voice, in which he informed the scholars that he had carefully studied the law and had found that his position gave him the right to maintain order in all parts of the district. He told them that he could send any of them to the Reform School in case they disobeyed me. At the last he turned to me and fairly shouted in a terrible voice:

"This gentleman has been selected as your teacher. His first duty will be that of enforcing the law. I stand back of him, and back of me stands the Government of this great State, and back of that the Government of these United States, and back of that all moral law. We are too strong to be beaten. We will not be imposed upon!"

The effect of this outburst was not immediate. The scholars looked at each other in wonder. The larger boys shook their heads sullenly and muttered to each other. It was the custom of Bear Creek to move slowly in such matters, but the movement was always sure. All such statements were to be reported at home and carefully discussed around the fireside. When some decision could be reached, the children could be sent to school armed with the parental authority to make things interesting for the teacher and fight the battles of the district through him.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: If I may be allowed to call you by that name as I have never written before: I live on a farm in the southern part of Alabama, 25 miles south of Mobile, and five miles from the Gulf coast. The bay from which the place gets its name furnishes good fishing and duck hunting. The creeks furnish good sport with hook and line in fishing for black bass and pickerel. The other day I went down to the creek which flows in sight of our place, and was back home in less than an hour with a bass which measured two feet in length and weighed seven pounds. Can any of the Cousins beat that? My father has a dairy of 13 cows. He ships the butter to Mobile where it brings 25 cents a pound. He also owns about 100 sheep.

Yours truly, FRANK WARREN.

[I think we would have to get up early and make a long day to beat that fish. I would like to catch one like it.—U. M.]

DEAR UNCLE MARK: I want to know if you want another niece. Pa takes the RURAL and I like to read the Cousins' letters. I am a little girl, and I have two brothers. We live on a new farm in Northern Michigan. We have a nice garden. Pa cleared the land last Spring. I have a nice flower garden from the seed that Pa. got with the RURAL. Pa. has a pint of Alaska peas. We have a lot of Prince Albert and Stratagem peas, Pa. raised from the seed you sent out last year. I have a hen and she raised 12 chickens. They are great big ones. Don't you think that is pretty good? She is raising 12 more. Your niece,

GEORGIE STEWART.

Kalkaska, Michigan.

[That is a fine record for a hen. You are a Cousin surely.—U. M.]

Miscellaneous Advertising

Purify the Blood.

We do not claim that Hood's Sarsaparilla is the only medicine deserving public confidence, but we believe that to purify the blood, to restore and renovate the whole system, it is absolutely unequalled. The influence of the blood upon the health cannot be over-estimated. If it becomes contaminated, the train of consequences by which the health is undermined is immeasurable. Loss of Appetite, Low Spirits, Headache, Dyspepsia, Debility, Nervousness and other "little (?) ailments" are the premonitions of more serious and often fatal results. Try

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

BUHACH

THE GREAT CALIFORNIA

INSECT POWDER.

A pure California production, an infallible exterminator of Roaches, Bed-bugs, Water-bugs, Flies, Fleas, Mosquitoes, Ants, Moths, and in fact all insect pests of the household, field, orchard, garden, and conservatory.

BUHACH is guaranteed to be as harmless to animal and plant life as it is destructive to that of the insects.

BUHACH is the powdered blossoms of a California grown flower and absolutely contains no acids or poisonous drugs of any description.

BUHACH is not to be classed with the thousands of worthless and dangerous preparations so called "Insect Exterminators."

BUHACH is the insecticide of progress.

Pure! Powerful! Potent!

BUHACH is not sold in bulk, but in sealed tins with yellow labels, upon which appears our Trade Mark BUHACH as above. Beware of base imitations. Ask your druggist or grocer for it and see that you get it. Descriptive circulars mailed free upon application to us. BUHACH PRODUCING & M'F'G CO. of STOCKTON, CALIFORNIA, 49 Cedar St., New York.

FLORAL DEPARTMENT; Illustrated, and carefully edited by EBENE. REXFORD

Letters from subscribers and answers to correspondents on all household topics. It is the best household paper ever published; and so popular that, in less than three years, it has gained a circulation of **270,000** copies each issue. Address:

LADIES' HOME JOURNAL, Phila., Pa.

SPAIN'S CHURNS. Star Churns, Rapid Ice Cream Freezers, Improved Tree Tubs, all made of CEDAR. Send for illustrated circular and prices. Clement & Dunbar, Philadelphia, Pa.

PERSONALS

EX-GOVERNOR ST. JOHN, according to Neal Dow, received $50 per night for his campaign work in Maine.

EXCEPTING only the sprained leg, which he is still unable to use, Senator Evarts has almost entirely recovered from his recent accident while driving.

LEWIS APPLE, editor of a weekly paper at Panora, Iowa, bought flowers at the State Fair to decorate his grave, and on reaching home killed himself with a revolver.

"EXTRA BILLY" SMITH, twice Governor of Virginia, reached his 90th birthday last week. He is still quite active, physically and mentally, and daily walks to Warrenton, Va., a distance of nearly a mile.

WHITELAW REID and his father-in-law, D. O. Mills, have been surveying the Owens River Valley, in California, near Reno, with a view to taking up 20,000 acres of land for a wine and grape-growing colony.

Charles Monckey, inventor of the Monckey wrench (ignorantly called the monkey-wrench), is living in poverty in Brooklyn. He sold the patent for $2,000, and now millions are made annually out of the invention.

SENATOR EDMUNDS' check for $50, accompanied by a very sympathetic letter, has been received by the Charleston relief committee. He will have a "walk over" in Vermont in his canvass for the United States Senatorship.

GUERDON S. HUBBARD, the oldest resident of Chicago, and one of the first of the white pioneers to visit the present site of the city, died there last Tuesday. He landed there in 1818, and resided there almost continuously ever since.

PATSEY COLLINS, while shovelling grain in the top of a big Niagara Falls flour mill, fell into the hopper, slid for 80 feet through a spout eight by ten inches in size, and shot out unhurt, with six tons of grain, into a car standing on the track below.

EX-POSTMASTER THOMAS L. JAMES applied for membership in a young men's Prohibition Club, of New York, Tuesday evening, and was rejected. He had signed the call for the Republican Anti-saloon Convention at Binghamton, and that was fatal to his reputation as a Prohibitionist.

GEN. W. T. Sherman, wife, daughter and a young son have come to New York to live permanently. The General's health is good, but he dosen't seem as lively as formerly, and some attribute his failing to disappointment because his eldest son, Thomas Ewing Sherman, has become a priest. A high political career was expected for the brilliant young man, who has just been appointed Professor of Rhetoric in the Jesuit College at Detroit.

JAMES G. BLAINE, Jr., aged 20, youngest son of the Ex-Senator, married without paternal consent, the other day; but was readily forgiven and assigned, *on dit*, $1,800 a year to live upon. He will probably go into business and thus add to his income. His wife was a Miss Nevins, and is a grandchild of Samuel Medary, who was Territorial Governor of Minnesota and of Kansas. She was educated at a convent in Cincinnati, has rare musical and dramatic talents, and is represented as exceptionally beautiful.

THE other day Geo. Gould, 24, eldest son and business representative of Jay, married Miss Edith Kingdon, an actress just returned from Europe, at his father's fine place at Irvington-on-the-Hudson. She has been on the stage about four years, and her real name is Adams. Has always borne an excellent reputation, and is a very handsome woman of about 22. George has continued steadily at work in his father's office here, right along. He is quite wealthy himself, and the "old man" is said to have settled upon him "enough to live quite comfortably."

M. CHEVRAUL, President of the National Agricultural Society of France for many years, celebrated his hundredth birthday the other day, and is still hale and hearty. Few have done so much for French agriculture and for various branches of science. He says longevity is hereditary in his family for generations past. His father lived to the age of 81 and his mother to that of 93. He has long adjured alcohol and tobacco, preferred chicken to any other meat, bathed much in cold water, used tea and coffee with moderation, gone to bed early, and walked out-doors daily in all weathers. He attended the theatrical performance given in Paris in honor of his 100th birthday—the first play he had seen for 20 years.

Miscellaneous Advertising.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your goocer for Dixon's big cake.

WEAK, NERVOUS AND DEBILITATED MEN
and Women seeking health, strength and energy, should avoid Drugs, Secret Medicines, etc., and send for "The Review," or "Health and Strength Regained," a large Illustrated Journal, published entirely for their benefit.

COPIES FREE.

It treats on health, hygiene, physical culture, and medical subjects, and is a complete encyclopædia of information for suffering humanity afflicted with long-standing, chronic, nervous, exhausting and painful diseases. Every subject that bears on health and human happiness receives attention in its pages; and the many questions asked by ailing persons and invalids who have despaired of a cure are answered, and valuable information is volunteered to all who are in need of medical advice. No similar work has ever been published. Every sick or ailing person should have it.

YOUNG AND MIDDLE AGED MEN, and others who suffer from nervous and physical debility, exhausted vitality, premature decline, etc., are especially benefited by consulting its contents. Everything such sufferers wish to know is fully given in its pages. If in need of medical aid or counsel, read it before "doctoring" or investing in medicines or appliances of any description, and you will save time, money and disappointment. If using medicine or medical treatment of any kind, read it and learn the better way.

THE REVIEW exposes the frauds practiced by quacks and medical impostors who profess to "practice medicine," and points out the only safe, simple and effective road to health, vigor and bodily energy.

Electric Belts and all curative appliances are treated upon; all about them—which are genuine, which are bogus. Belts on thirty days trial (?) and other fallacies reviewed. Thousands of dollars saved nervous-debility sufferers and others by the advice given. THE REVIEW is now in its ninth year of publication. Complete specimen copies mailed FREE

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1914. NEW YORK, OCTOBER 2, 1886. PRICE FIVE CENTS. $3.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

The Vineyard.

THE BERTRAND GRAPE.

ABOUT the middle of last July we received from our friend P. J. Berckmans, Augusta, Ga., a specimen bunch of a seedling grape originated in Middle Georgia. Said he: "The vines are now eight years old, and have yielded five crops, and this year there are upwards of 100 bunches. No trace of rot. Vigor all that could be desired. It belongs to the Æstivalis group. In addition to its excellent quality, it has the advantage of ripening when nearly all other bunch varieties are about gone. The originator calls it Bertraud."

The bunches are sometimes shouldered, as shown at Fig. 374, sometimes not. Black with blue bloom. Peduncles long. Skin firm and thin. Very juicy, hig-hflavored and sprightly. Flesh melting; pulp not perceptible—one and two seeds. A refreshing, delightful grape. (See editorial page.)

PRAISE OF THE NIAGARA GRAPE.

FOR two or three years, Geo. W. Campbell, of Delaware, Ohio, has spoken many times unfavorably of the Niagara Grape, and even at this late day he remarks, in his fall circular, that it has succeeded well in some places and signally failed in others; and also that in suitable locations and favorable seasons it has been successful and profitable; which would plainly give the average fruit grower to understand that, in order to succeed with the Niagara, he must have a location especially adapted to the growing of grapes and also a very favorable season.

I am engaged somewhat extensively in raising grapes for market purposes, and have no axe to grind. I commenced setting the Niagara Grape in the Spring of 1882 for market purposes, and have set more or less of the variety every year since. I have a fine show of them in bearing this year. I train to four arms, according to the Kniffin system. I now have single arms, with 36 nice solid bunches of fruit upon them. Out of 41 varieties of grapes which I have in cultivation, the Niagara has proved itself to be the strongest grown and the most productive of the whole lot. It is also as hardy as the Concord, better in quality, and from six to eight days earlier. It is also a long keeper and a splendid shipping grape, and, taken altogether, I consider it for market purposes the best grape for growers to set that has been practically tried and is now before the public.

Grand Haven, Mich. WALTER PHILLIPS.

GRAPE NOTES.

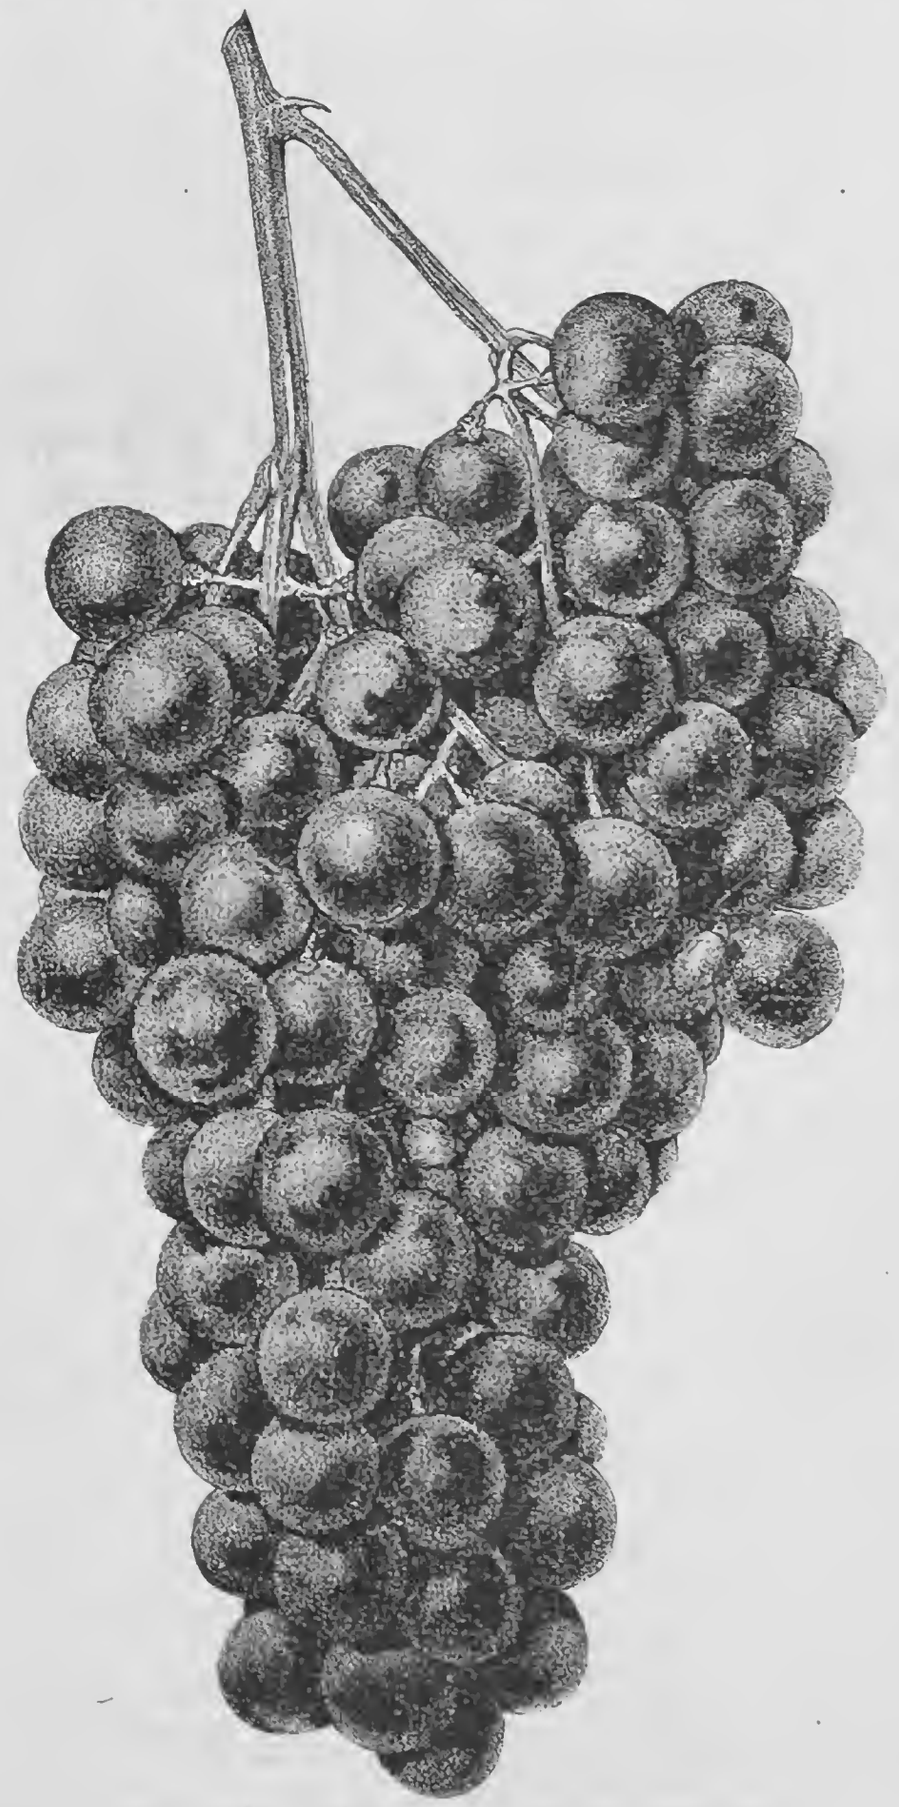
MOORE'S EARLY is the best early grape I know of for market or home use; larger than the Concord, somewhat sweeter, but a little more insipid in taste; not much inclined to rot; large seeds.

NIAGARA.—Some rot first crop; only a few bunches on a grafted vine. Bunches medium in size; berry medium and of good quality, but with a trace of muskiness. Not pulpy; seeds small.

ROMMEL'S AMBER.—Little rot. Much the same as Niagara in size and color; of purer flavor. Seeds separating too easily from the pulp. Rather tender for keeping. Bore well this year, ripening a little later than Concord. I think this is a good home grape.

POCKLINGTON.—A little rot. A thrifty grower. A large showy grape of poor quality, almost as foxy as Martha, which I consider too poor to eat. Will do to sell to the legion that eat the Ben Davis Apple.

EARLY VICTOR.—Some rot. Ripens nearly with Moore's Early, Champion, Janesville, and several others. A medium-sized black grape, of flavor distinct from the Concord type; no foxiness. I was expecting no rot, but was disappointed. Vine a good grower, and it may bear better next year. The berries hold well to the stem.



BERTRAND GRAPE. From Nature. Fig. 374.

DUCHESS.—Much rot; no perfect bunches left, owing to rot. Young wood scabbed with disease. Berry small—very good.

PERKINS.—Some rot. Does not succeed with me. More rot than in the Concord. Not very hardy or early. Rather shy in bearing. Foxy, but better than Martha or Pocklington. It is medium in size, and very showy when well ripened, being somewhat mottled in color like a Blood Peach.

TRIUMPH.—A fine grape, but vine too tender.

The Concord is the most reliable grape we have, and it will be a long while before it will be superseded here. People ordinarily prefer it to the best of Rogers's hybrids for steady use, just as they prefer a Janet to a Grimes's Golden Apple, or bread and butter to cake and pastry. BENJAMIN BUCKMAN.

Saug. Co., Ills.

[MOORE'S EARLY is not anywhere, so far as we know, as productive as the Concord. It ripens at least 10 days earlier, and the berries are larger. In these two respects it excels its parent, while the vine is fully as hardy and vigorous.—EDS.]

Pomological.

A GARDEN FRUIT EXHIBITION.

WHILE much may be learned of fruits by viewing them when on exhibition at the fairs and horticultural meetings, much more can be learned by visiting growers and seeing the fruits on the trees and vines, thus learning the growers' methods. Hence my recent visit to the fruit gardens of Ellwanger & Barry was enjoyable and profitable. Mr. W. C. Barry, recently returned from a long season of retirement among the Adirondacks, was my guide. First we visited the plum orchard. Here were ripening the productive and popular Reine Claude and Lombard, the small and prolific Damson, the showy Pond's Seedling, the large and showy Quackenboss, the Yellow Egg, the beautiful and fine-flavored Washington and many others.

"Which two prove the most popular for market, Mr. Barry?"

"The Lombard and Reine Claude. The latter pays best, ripening after the others are mostly gone. Washington is one of the largest and most beautiful, and of superior quality."

"How about the Wild Goose, Weaver and others of the native type?"

"They are of no value for this locality, where we can grow those so much superior in size and quality. They make straggling, uncouth trees and, with a few exceptions, do not show as much vigor."

"How do you manage the black-knot?"

"We simply cut off the diseased limbs and burn them. You can see that none of these trees show any signs of the disease." The soil was kept in fine tilth, the branches well thinned. The trees did not appear to have been planted over five years.

We then passed across the ornamental grounds. Here are long stretches of closely cut turf, extending farther than the eye can reach, bordered with a thousand varieties of shrubs and trees. Then I passed on to the private garden of my guide, to see his dwarf pears. His favorite appears to be the Anjou. The trees were well laden with as fine specimens as the most critical could desire to see, each perfect in form and color and of large size, though they had not attained full growth.

"The culture of these fine fruits is one of the greatest pleasures I enjoy," remarked Mr. Barry.

"What is your opinion of seeding dwarf pear orchards to grass?" I asked.

"I should seed it only when is was making excessive growth, and then cultivate it again after the excessive growth has been checked. On this soil it is not possible to get an excessive growth. We fertilize the soil as highly as possible, yet the annual growth does not exceed 18 inches. If the wood begins to ripen well by September 1, we do not consider the growth excessive."

"But will such high culture be profitable for those who grow for market?"

"Yes," replied Mr. Barry. From the appearance of these trees I concluded that few need fear that their soil is too rich, or that their trees are growing too vigorously. I should rather infer that most dwarf pear orchards are suffering from starvation. The trees were trained low. There were many varieties all bearing heavily, and yet this is not the bearing year for pears in this vicinity. I cannot see how men of wealth and taste can more successfully beautify a part of their home grounds than by planting choice fruits.

On our way to see the grapes, we stopped to test the Surprise Melons, which Mr. Barry says he has found to be the best of all in quality. The flesh is as yellow as gold, and equal to a peach in flavor. Mr. Barry says it is as refreshing as the finest wine.

The grapes, grown under glass, without artificial heat, except such as the glass afforded, the roots extending into the garden beyond the house, were an attractive exhibition. The leaves were broad and luxuriant, the canes of the present season's growth being the size of my largest finger, but nowhere crowded, trained with the greatest care and watched tenderly. Should the gardener forget to give them air in the heat of the day, they would

perish. There were numerous varieties, differing in color, quality and size of bunch. Many of the bunches I judged to be a foot long, and with numerous shoulders, each of which was as large as ordinary bunches of out-door grapes. Two of these bunches Mr. Barry placed in my hands and my arm was weary with the burden when I reached my wagon.

I noticed by Mr. Barry's remarks that he reads the RURAL NEW-YORKER. He spoke of the work of the various horticultural societies. He considers the discussions and the papers read at these meetings of the greatest importance, and that they should never be made of secondary importance. He says he can listen with pleasure and profit to such discussions and essays, and if he can, it is my opinion that we all can derive pleasure and profit therefrom. While the press is doing a great work, and none greater than the RURAL NEW-YORKER, it must be conceded that our horticultural meetings furnish the greatest opportunities for gathering and disseminating information on this important subject. CHARLES A. GREEN.

CANADA FRUIT NOTES.

Failure of Fameuse; a good word for the Marlboro and Golden Queen; Niagara the least injured among grapes.

THE season of 1886 will be long remembered by the fruit-growers of this Province as the darkest for apple growing they have ever known. Early in July spots were seen on the principal varieties, and the Fameuse, our orchard's glory for autumn fruit, was the heaviest sufferer. The crop stands to-day not worth the gathering for the first time in the 32 years of fruit growing in which this family has been engaged. Duchess, Tetofski, Alexander, Charlottenthaler, Yellow Transparent; in fact, all the Russian apples escaped, but all others, except the russets, have suffered. Our theory with regard to the spots is that they occur when a cold night with fog is followed by a hot morning sun, fixing the fungus on the apple before the water from the heavy mist has had a chance to evaporate.

Of pears we have tried several varieties. Clapp's and Kieffer's have succumbed; Flemish Beauty and Mount Vernon are bearing this year some handsome fruit.

Raspberries have been a good crop; Clarke about as usual. Many of the older sorts were winter-killed, and Cuthbert suffered for the first time. Marlboro stood the Winter bravely, and bore for the first time. The fruit was fine and well colored, quite marketable for firmness, and in quality equal to any other, while the size is superior, and that tells greatly in its favor as a market berry. Golden Queen also stood through its first Winter, and bore a little first-class fruit. It is destined to become popular if it continues hardy. The color is like that of the Brinckle, but the texture is firmer.

Blackberries always do well here, and we have Taylor's still holding out. But, sad to relate, our Minnewaska died, though we blame the location more than the variety, and we mean to try again. Early Harvest is early, but it suffered a little during the last trying Winter.

Grapes are a fair crop, but sustained some injury from a late frost. Niagara was least injured, and the fruit is good. It is the most prolific grape we have ever grown, and as hardy as the Concord. Agawam, Brandt, Othello, Worden, Croton and several other varieties mildewed so as to cause a total loss of the fruit. Duchess is as good as ever, and ripened early. Jessica had a few good bunches, and all others had the usual quantity. The season has been so far favorable for ripening the fruit, and the grape vines are healthy. Brighton suffered from the June frost in flowering, yet they must be plentiful somewhere as they were selling last Saturday in Montreal market for five cents per pound. The Herbert and Wilder, famous as large black berries, are the latest to ripen, and we generally get our first fruit from the Early Dawn, which, though small, ranks with Eumelan, Duchess, Brighton, Lady and Moore's as first in quality.

Near Quebec. ANNIE L. JACK.

PLATFORM LADDER.

AT Fig. 375 we illustrate a ladder which is very useful and convenient in picking fruit from trees. The platform, of strong, light wood, is 1¼ or 1½ inch thick, 10 or 12 inches wide where attached to the legs, tapering to a width of four inches. It may be six to nine feet long. The legs are 6 or 7 feet long, 1x4 or 5 inches at the top, tapering to 2½ or 3 inches at the ground. Let the legs extend one inch above the platform, and nail a good cleat across the top of the plank, between the ends of the legs; also one on the outside of the legs, close under the platform. The legs should spread out somewhat, so as to be 3½ feet apart on the ground. Nail light pieces across from one to the other for steps. Light braces should extend from the middle of the legs to the middle of the platform. The engraving fully explains all, and shows how the ladder is used. It needs no skill and very few tools to make it, as everything is nailed. It may be moved around sideways five or six feet without changing the end in the tree. It enables a person to pick clean from the outside to the center of the tree without changing the ladder, and one can stand on it as comfortably as on the ground. I have used this style of ladder 15 years, and have found very few places where it was not handier than a long, straight ladder, and it is hard work to stand on a ladder round. The inside end of the platform may be raised or lowered a foot or more and still stand firmly, and there is always a limb or crotch on which to put the end. D. S. H.

Wakeman, Ohio.

PEARS.

MT. VERNON—With the exception of Seckel, this is the healthiest and hardiest of any dwarfs and the thriftiest grower of all and a fine bearer of large russet pears of very good quality more acid than the Anjou, but to my taste just as good and preferable to that noble variety for planting here.

CHAMBERS—A few specimens were obtained this year from a graft and I am fully satisfied not to plant any more. Fruit small and well colored; but as poor as the Buffum. Ripening first of September. B. B.

Sangamon Co., Ill.

FIGHTING BITTER ROT.—We have been troubled somewhat with bitter rot in apples, but succeeded in two instances in reducing the trouble. The first was by accident, the latter intentional. We trimmed sharply just as the trees were coming into bloom. The large limbs must not be cut at that time, however, if the trees are an object. L. GOEPPER.

Warren Co., Ohio.

PLATFORM LADDER. Fig. 375.

Floricultural.

TEN HOUSE PLANTS FOR THE WINTER.

E. L. TAPLIN.

THE chief requisites of success in the winter care of house plants are sunshine, moisture, uniform temperature, and cleanliness. It is not wise for the cultivator to be too ambitious; one cannot produce all the effect of a varied conservatory in one window, and any attempt to do so will result in disastrous failure. When I say moisture is an indispensable requisite to success, I do not mean that the soil should be waterlogged, nor should the pot stand in a saucer of water, unless it is an aquatic plant. I mean that the atmosphere should be moist, and here we encounter the greatest of all difficulties in the culture of house plants. Both stove and furnace produce a dry heat, and this is more or less trying to all plants. Where possible, it is well to stand a pan of water over the stove or furnace; the evaporation is very serviceable. If this cannot be done, the only plan is to water frequently, but discreetly. Gas is also very trying to plants; even where there are no perceptible fumes, the light frequently causes the flowers and buds to drop off. When we are arranging for the comfort of our floral pets it is well to recollect that we ourselves require sunlight as much as they, and it is hardly wise to entirely block up the only sunny window in a room during the dark winter days. A stand or window box is always preferable to the numerous shelves we so often see shutting out every ray of sunlight. For these reasons, plants noticeable for fine foliage rather than for flowers may be specially recommended since they require less sunshine.

We must give first place for beauty and ease of culture to Ardisia crenulata, a plant little known among amateur growers, though becoming popular as its virtues are becoming known. It is a sturdy-growing, shrub-like plant, with shining, ovate, dark-green leaves. In August or September it bears small, inconspicuous, greenish-white flowers. These are followed by bunches of berries, which, as they mature, turn bright red, resembling, in size and appearance, the Mountain Ash. These berries last the entire season, keeping their beauty, in fact, until a succeeding crop is ripe, so the plant is never without them. The effect is really beautiful, so bright and Christmasy. The plant does well in an ordinary living-room, with regular watering, but it must not be waterlogged, or stand in water. The leaves may be sponged once a week, and it will keep its brightness in a northern window where there is little or no sun. This plant is a charming decoration for the dinner table; in fact, it is infinitely desirable in every way.

Another universal favorite is one of the fan palms, Latania Borbonica, like the Ardisia, noticeable for its easy culture and readiness to respond to very little attention. In its tropical home it attains a large size, but in house culture it grows slowly, so it is many years before a plant is too large. Its foliage has such a clear, healthy, look, apart from its handsome form, that it makes a striking ornament with an air of tropic suggestiveness. Its culture is similar to that of the Ardisia, and, if in a light room, it will do without being directly in the window. During the Summer it will do nicely outside.

The Climbing Asparagus (Asparagus tenuissimus) is not yet very familiar, but it is a charming thing and may be highly commended as a window climber. Nothing short of a hard frost or the absence of water for two or three weeks will discourage it. It climbs and twines like smilax; but the foliage is fine and feathery, like common asparagus, only more so. It does well in a room heated by a stove, does not harbor insects, and, in short, is a botanical paragon.

Another more familiar climber is the old-fashioned German Ivy, so-called by the rule of contrary, I suppose, for it is not an ivy, and does not hail from Germany. However, it is a rapid grower of very pretty habit, and is usually of more easy culture than Ivy proper.

All lovers of house plants are familiar with the large-leaved Begonia Rex. Its robust habit and handsome, vari-colored, metallic leaves justly make it a favorite. Like the palm, it is an excellent thing for city houses where there is little sunshine. Of course, if grown in a gloomy locality it will only flower weakly, and will not be as richly colored as when in good sunlight, but it will do better than most plants and is attractive under any circumstances.

Another member of its family, Begonia rubra, is equally desirable, being the most attractive of the plain-leaved varieties. The long leaves are a bright, shining green: the large flowers, profusely produced, are a brilliant red. It is a very free grower, easily propagated, and if sponged or syringed in addition to the ordinary watering, is very cleanly in its habits.

Most growers of house plants are familiar with the ordinary abutilons, sometimes called bell-flower, but very few grow the trailing variety, A. Mesopotamicum. It is a charming little thing, throwing out long, trailing branches. The leaves are smaller and more pointed than those of the ordinary variety, beautifully variegated with gold; the little, bell-shaped, dark-red flower has a besom-like clapper of black stamens. It is as easy to grow as others of its class, but it requires a good sun to bring out the variegation of the leaves.

For those desirous of profusely flowering house plants nothing is better than the Chinese primrose. It can be kept continually in bloom from November till May, and the blossoms form a whole gamut of color, from pure white to deepest crimson. They are of easy culture, requiring little attention save in watering. They must not grow actually dry, though here, as everywhere else, the cultivator must be warned against over-saturating the pots. A great advantage of the primrose is that it is very rarely infested by green-fly, or similar pests. Under the same circumstances as the Chinese primrose, we may grow its modest little yellow-flowered English cousin, though a living room is rather too warm for it. The frail English flower, however, is always rather spindling under our alien skies.

Cyclamens are good house plants, and may be readily grown, flowering profusely. It is well to notice in purchasing, however, that one should get plants of good constitution; many growers seem to have a very sickly strain, with worn-out vitality. In the very beginning of September plants should be repotted, shaking all the old earth off, and giving new soil; the crown of the bulb should be left uncovered.

For those having rooms rather cool than otherwise, violets are charming, but it is useless to attempt them in a very warm place. They will flower profusely during the Winter in a temperature of from 45° to 50°, and their beauty and fragrance make them most desirable. Of single varieties the Czar is very fine; it is large, dark purple, and very fragrant. The Neapolitan is the best double variety. With all house plants frequent sponging or syringing of the leaves may be advised as a preventive of red spider and similar pests. But it is well to reiterate that in every case one must water with brains; no amount of printed instructions is equal to a little personal discretion in this case. Discretion, enthusiasm and energy are the three graces of horticulture and they cannot fail to bring success either to professional or amateur.

THE FLOWER GARDEN.

WILLIAM FALCONER.

DON'T neglect the keeping of the garden, because the season is advanced. A clean and tidy garden with little in it is prettier and more cheerful than a well stocked garden full of dead flower stems, scattered leaves and sticks and overgrown with weeds.

HARDY PERENNIALS.—Fountain-leaved, Maximilian's, multiflorus and several other decorative sunflowers; Curtis's, lævis, and other showy asters, some boltonias, purple rudbeckias, mist-flower, red and white Japanese anemones, lance-leaved coreopsis, Seibold's sedum and some others are still in good bloom. Cut over phloxes, loosestrife, bee balm and other plants that have done blooming and whose leaves and stems are fading. Save the stakes you had supporting larkspur and other rank growers for another year's work. If you wish to make any alterations in your borders next Spring, mark now the places of fraxinella, butterfly weed, platycodon, gypsophila and Japanese anemones, as they die down to under ground and start late in Spring, and nothing is left above ground to indicate their places in Winter.

SELF-SOWN SEEDLINGS.—Any amount of self-sown seedlings are scattered among the borders. Lift and plant close together to stay over Winter what kinds you wish to keep. They will mostly consist of hollyhocks, Canterbury bells, fox-gloves, Sweet Williams, coreopsis, larkspur, speedwell and Deptford pinks. Hollyhocks and Canterbury bells will be grateful for the protection of a cold-frame or at any rate a mulching of leaves, sea thatch or evergreen branches.

ANNUALS.—Spring sown annuals barring zinnias, globe amaranths and marigolds are almost all past, but a goodly show still remains of gaillardias, asters, marigolds, stocks,

Drummond phloxes, zinnias, mignonette, candytuft, pinks, coreopsis, balsams, scarlet sage, larkspurs and petunias of June and July sowings. Poppies or eschscholtzia sown in September or October bloom in Spring earlier than those that are sown in Spring, still sowing annuals in Fall for spring flowers is hardly worth bothering with.

TENDER PLANTS.—After the first nip of frost we may have a week or two of fine weather and dahlias and other flowers forget their wounds enough to bloom again quite cheerily. But the woeful look presented by half killed plants cannot be compensated for by the few flowers they may, for a little while longer, continue to bear. Cut them over, save their "roots" and tidy up the place. Cut back abutilons, lemon-scented verbena, lantanas, fish and rose geraniums; shake away the earth from the roots, and put them into the smallest pots into which you can conveniently crowd them. Have a young stock of coleuses alternantheras, iresines, double petunias, geraniums and the like. Don't save scarlet sage, centaurea, golden feverfew, vinca rosea or nierembergia as you can get up a better stock from seed next Spring than you could from cuttings.

THE LAWN.—Now is the time to make repairs. Where bumps occur reduce them, where there are hollows skin them and fill them up. You can lay sod anytime before the middle of October; later the sod may not get fastened enough to escape displacement by frost. You can also sow seed before October; later the seedlings might hardly be strong enough to escape being winter-killed. You can make the smoothest kind of lawn by preparing your ground now—subsoiling, enriching and leveling it. Then let it lie in that condition over Winter; in Spring unfasten the top a little, then firm and level the surface equally, sow the seed, rake it in lightly, and roll heavily but smoothly.

TREES AND SHRUBS.—Remove suckers and stem sprouts and destroy all tents of caterpillars. You can now see the dead wood, but you cannot very well see it in Winter, therefore this is the time to cut it out. Cut the roots at three to six feet off from the stem of all the large trees you intend transplanting next Spring, the trees will recover the loss considerably before transplanting time and can be moved with much greater certainty of success. Transplant evergreens. Deciduous trees and shrubs may also be transplanted as soon as they lose most of their leaves. Fall planting is safe enough in well sheltered places, but in bleak and exposed places spring planting is to be preferred.

THE CENTURY PLANT.

THERE are very few plants more effective in certain positions than the Century Plant or Agave, whether we employ the plain or variegated-leaved. Its stately beauty, massive growth and readiness to be satisfied with almost any soil or situation, and the little care needed to Winter it, render this plant a general favorite for out-door cultivation. It will stand several degrees of frost without injury, and may be taken up in the Fall and placed in the cellar, where it will require no further attention if only its roots be covered. Though called "Century" Plant, its period of blooming depends entirely upon the culture given it. In greenhouses it will sometimes bloom when 10 or 12 years old, while if used as a garden plant in a climate where it needs Winter protection, we doubt if it would ever bloom. In green-house culture or in its tropical home the flower stem sometimes grows from 20 to 40 feet high, bearing a great number of yellowish flowers, then the plant dies. But many little plants form about the base of the main plant, which are easily propagated. The Agave is really an Amaryllis, and the name aloe by which it is often called is confusing. The true aloe is a lily, blooming yearly. It is from this that the well-known purge is obtained. But we desire chiefly to call attention to the beauty of the American Agave as an ornamental plant, and to the position in which it is seen to the best advantage. Our picture, Fig. 377 (p. 661), which we have re-engraved from our able contemporary the London Garden, shows, better than we could explain, just such a position. Low-growing, herbaceous plants are seen beside it, and in the back-ground a vine-clad birch. On the left of the walk are palms intermingled with evergreen shrubs and low-growing trees.

Horticultural.

NOTES IN THE GARDEN.

THE FLAGEOLET BEANS.

LAST Spring a writer in the RURAL spoke of the Flageolet Bean as being an excellent shell bean, but worthless for snaps. This is quite true of the Green-seeded Flageolet, but not of the red and the purple-seeded sorts of that name. Why they should be called by the same name is a mystery. There are no two beans in the whole list more unlike in every particular, aside from both being bush beans, and both very good shell beans. The red and purple sorts are very nearly alike. The former has sometimes green and sometimes yellow pods the green-podded being nearly if not quite identical with the Canadian Wonder.

OTHER GOOD BEANS.

Low's Champion, a red, round-seeded dwarf bean of the "Cranberry" type, is one of the earliest, most vigorous, healthy and prolific beans I have ever grown, and is an invaluable variety for the market garden, both as a snap and shell variety. Fully its equal as a snap bean, a little earlier, and with a golden pod is the Golden Prize, an enormously prolific sport from the common yellow-eye bean. In every way, as an early market snap, it equals the favorite Ferry's Golden Wax, but, unlike it, is entirely free from spotting. Among pole snaps the Mont d'Or is the best, being very early and prolific, excellent in quality, and quite free from disease. For a late snap the Long-podded Kentucky Wonder is most excellent. The Dwarf Mont D'Or spots so badly as to be worthless. As a succotash bean none is superior to the speckled Cranberry or "horticultural" pole bean. There are many varieties of this type. The one I have selected as best is very early, and very productive; the pods as handsome as a flower with their rich carmine stripes. All the dwarf varieties of this bean spot badly with me.

SQUAW CORN.

Connecticut's model agricultural secretary, T. S. Gold, hearing that I was in search of the "Indian Blue Corn," most kindly sent me, in in the Spring of 1885, an ear of corn, about half of the kernels of which were a bright china-blue and the other half milk-white. I planted each color separately, and noted during their growth that the foliage of the blue corn was of a much darker green than that of the white. This encouraged me to think they might be distinct varieties, which could be easily separated, and although the mixture showed in both lots, there were in one several entirely blue and in the other many entirely white ears. This year I have planted a patch of each, and feel assured that in a few years each will come entirely true. Mr. Gold wrote me that he obtained this corn from the West, but it is a true flint corn, very early and very dwarf, but with large ears, having much the appearance in the field of the Marblehead Sweet Corn. I am hoping that the white variety will give us a good Northern hominy corn. Nothing could be whiter, nor anything bluer than its mate. I have been kindly favored with "blue" ears from various localities, but nearly all of them were of a dusky "blue-mixed" shade. Mr. Gold's is "true blue," and would be a decided acquisition where corn ears are in request for decorative use.

Newport, Vt. T. H. H

THE VEGETABLE GARDEN.

COLD-FRAMES.

I am now preparing the cold-frames for winter vegetables. They are of the common size, taking 3x6 feet sashes, and of length to suit the number of sashes. Some are permanent fixtures, and made of 1¼ inch pine plank; others are temporary arrangements put up for winter work and removed in Spring.

THE SITUATION in which they are placed is warm and sheltered, sloping to the south and southeast, and protected on the north and west sides by buildings and close wooden frames. But November is early enough to put up these fences. A warm and sheltered situation is of very great importance, because frame crops should have a good deal of sunshine and ventilation in Winter, otherwise they will spindle or rot. Besides, in warm, sheltered places frames do not need nearly so much covering in severe weather as they do in open, exposed situations.

SOIL.—For ordinary crops I fill up to within some six inches of the top in front and eight or nine inches at back, using rich loamy soil with lots of finely-rotted manure in it.

KIND OF CROPS.—Cabbage, parsley, spinach, lettuces, radishes.

CABBAGE.—I shall sow Early Jersey Wakefield out-of-doors about the 20th or 24th of this month; then when they are three or four weeks old, transplant them into the frames about two inches apart each way. During Winter I shall put on the sashes in the case of hard frosty weather, and when the thermometer indicates 20 degrees or more of frost I shall add a little additional covering in the way of wooden shutters, straw mats, or some "thatch"; also cover up and tilt up the sashes at the same time in the case of wet or snowstorms. Don't coddle up the plants, but always ventilate them freely in favorable weather.

THE NEMAHA BLACKCAP. From Nature. Fig. 376.

CAULIFLOWERS may be treated in the same way as cabbages, except much more tenderly in Winter, for they are not so hardy. But I have never had very good luck with fall-sown cauliflowers; they mostly "button" in Spring. But with those sown in hot-beds in early Spring I have had good success.

PARSLEY.—I sowed parsley in frames, in rows nine inches apart, about the first of August. It is now up nicely, thinned a little and shall yield me my best crop in Spring. It does not run to seed so soon as the older roots, which I transplant into the frames in September and October. I am transplanting these now. I lift part of the last spring sown crop, shorten the tops and roots and plant with a dibble, as I would cabbage. From this I cut from December till April. Our present out-door crop will give us lots of parsley till December. In order to be able to cut parsley every day in Winter we have to completely exclude frost, but this is easily done by a thick covering of straw mats kept dry by light wooden shutters over them. For general family use a box filled with plants and kept in the cellar usually gives parsley enough.

SPINACH.—From the middle to the end of September I sow round and prickly spinach in warm places out-of-doors, in beds, each containing six rows a foot apart. In November over these I fix board frames. Even with no other protection than the sashes I get a vast deal more spinach from under these frames than from the same amount of unprotected plants. On account of field mice it is unsafe to mulch the plants with anything.

LETTUCES.—For winter work I prefer and use Tennis Ball—a small, pretty hardy, solid-hearting kind. About the middle and again the end of September I sow broadcast out-of-doors, then when the seedlings are two or three weeks old transplant them two inches apart into cold-frames. These lots give me stock enough for my succession plantings in hot-beds in Winter and cold-frames in early Spring. Treat them just as you would cabbage plants in frames. Earlier sowings, also those sown in the middle of the month, give me hearting plants in cold-frames up till New Years, or later. These are set out nine inches apart each way. Hearting plants should be kept warmer than stock plants.

RADISHES.—Sow in cold-frames in September and the first part of October, after that a slight hot-bed is needed to grow and root them quickly. W. FALCONER.

Long Island, N. Y.

THE NEMAHA BLACKCAP.

IN May of last year, Mr. C. A. Green of Clifton, N. Y., sent us several plants of the Nemaha blackcap. The best canes are now, one inch in diameter at the base and about nine feet long. It is as late as the Gregg, though commencing to ripen before. The berries are firm, borne in close clusters and are of good flavor—far better than the fruit of Gregg. The seeds are rather large and the berries have some bloom. On June 19 we picked some of the largest blackcaps from this variety, that we have ever seen. How much of the size was due to a favorable season can not be estimated, since this is the first year of fruiting. As to hardiness, we can only say that it has not thus far been injured in the least. We deem it for the Rural Grounds superior to the Gregg in every way. Our illustration, Fig. 376, shows an average cluster of fruit.

REMARKS OF MR. GREEN.

The Nemaha originated with Hon. Robert Furnas of Brownsville, Neb. As I remember, he found it growing in some fence corner. His claim for it was remarkable hardiness. We have fruited it here four or five seasons. It has passed through some severe Winters, and our location is about the worst in this State for winter-killing. It has proved much hardier than Gregg with us. One Winter the Tyler, growing by the side of Nemaha, was injured much more. We have all thought the quality of Nemaha superior to that of Gregg, but this season it was no better. Nemaha resembles the Gregg, and many of our friends write us that they can see no difference. If they get a hard Winter they will discover, by the dead canes of Gregg, the dividing line.

Clifton, N. Y.

MY GOLDEN QUEEN RASPBERRY

Has shown itself to be of good quality—I think fully equal to Brinckle—and in firmness is much more desirable than some of the red varieties; but it is not as firm as Cuthbert. It has grown remarkably strong canes, and if it proves to be hardy, will be a great acquisition. Brinckle's Orange is by far too soft for market purposes. For my family use I keep a small patch of both it and Pride of the Hudson growing by the side of a wall. They need no other protection in this latitude. D. E. H.

Hampshire Co., Mass.

SALT AND PEPPER FOR THE CABBAGE WORM.

THE cabbage worms in my garden were very destructive this Summer, but going over them twice, at an interval of a few days, with a mixture of salt and pepper, put on them pretty thick, killed the worms and did not injure the cabbage. WM. G.

Menominee, Mich.

Farm Topics.

CORRESPONDENTS' VIEWS.

SUCH a list as the RURAL has just published of the Congressmen who worked and voted against the Oleo Bill is useful for reference, and should appear in every agricultural paper in the country. If the farmer wants his interests looked after, he must elect men to Congress who are in sympathy with him. If he allows other trades, crafts and professions to put a party ring in his nose and lead him whithersoever they will, he can rest assured that they will lead him out of his own good pasture and turn him into the briar path of rumination, to browse on the thistles of humiliation and chew the bitter cud of remorse.

Morrisonville, Ill. F. G.

HOUSEWIVES have an intense disgust for all house insects like roaches and ants. They can see these creatures and witness their work. The little "mites" are equally injurious, yet they are so small as frequently to be invisible to the naked eye. Not long since a lady

sent us a sample of her Graham flour. We found it contained a large number of two species of mites, one of which must have been invisible to those who have not the keenest eyesight. Hardly one housewife out of a thousand would have detected the strangers. Most would have gone on making bread from this infested flour, without thinking that every loaf entombed hundreds of these little creatures. "Where ignorance is bliss, etc." I do not know that cooked mites would prove unwholesome food, but neat housewives would rather be at the trouble of frequently scrubbing and refilling the flour boxes than to know they were setting before their family this "mity" bread. C. P. GILLETTE.

Lansing, Mich.

I PLANTED the cantaloupe with stable manure, the muskmelons with a compost of night soil, and the watermelons with stable manure and cotton-seed meal. The muskmelons were best. I have never found any northern corn to do well the first season; it takes two or three seasons to get acclimated. C. C. W.

Mobile Co., Ala.

THE feed mill which I secured as a premium gives universal satisfaction. I had it at our fair, and drew first premium.

Fluvanna, N. Y. H. A. WHITTEMORE.

I HAD a piece of land very full of weeds. I plowed a part of it in the Fall for a fire-break. The rest I burned over the following Spring, then plowed it, and planted the whole field to corn, and seeded it to grass the next Spring. To-day you can see to the very edge of the fall plowing. It is well set in grass and no weeds. The spring plowing is full of weeds and little grass. W. I. R.

Burlington, Ky.

IN every neighborhood that I have ever lived in there has been a farmer who always bought second-hand tools just because they were cheap. At every auction he would invest in a lot of old truck just because it sold for a small sum. It is needless to say that such a man always makes a cheap, second-hand farmer. All his store room is filled with a lot of old trash that nobody can use. G. M.

Randolph, Vt.

THERE are in this country thousands of what I may call accidental farmers. They are men who from sickness or accident have not been able to succeed in other vocations. They read about the comfort and independence of farm life and sell what they have and go to the West to get a piece of land. They know no more about the land than the land knows about them. The living for the first year or so comes so hard that many of them become disgusted and drift away into something else. Those who persevere, keep out of debt and study the methods of their successful neighbors come out all right. It takes grit to make a living under such circumstances. The worst of it is that people think farming is so easy that when they come to find out just what it is they feel sick. J. I.

South Creek, Neb.

I KNOW farmers who fully expected to get rich at selling soap. They answered some of those advertisements where people are promised $75 a week at home. They got an answer stating that for $5.00 a recipe for making a valuable soap would be sent. Some farmers are foolish enough to think they can compete with a soap factory. They send the money and make some soap, but they can't begin to make it for the price at which ordinary soap is sold. I know of several instances where this thing has been tried. The soap is good but it is absurd to suppose that a farmer can make it as cheaply or as well as a manufacturer who has everything to work with. Better let the soap business alone. Indeed a farmer seldom makes any money by meddling in outside matters. A successful man devotes all his attention to his legitimate business.

Hamilton Co., Texas. L. MCCARTY.

WHAT is a man with a large, worn-out farm to do with his manure? My farm is very poor and my quantity of manure is limited. I make all I can, but there is not half enough to go around. The usual custom here is to put all the manure on to a few acres and let the rest of the farm go. That's the only way we can get any decent crops, but I would like to improve more of my farm. It is a question of putting all the manure I can get on to a few acres, or of scattering it over a large area and raising less per acre. K. H. C.

Bristol Co., Mass.

I AM picking superb strawberries, second crop, nearly as large as first crop—Cumberland Manchester and Sharpless. Hansell and Crimson Beauty did nothing early in the season, but are now loaded with fair berries. For the first time in my observation a cane of blackcap that bore a full crop is now bearing a second crop at the points. It is not a new cane.

THAT MANURE QUESTION.

HENRY STEWART.

Lessons from 30 years' experience; how plants feed; manure piled up and spread out; saving volatile fertility; application of manure to grass land; and to plowed land; plowing in manure; heat in the soils; leaching of manure in the soil.

MR. O. S. BLISS has, in a late RURAL, very ably argued that manure question from the side of surface application; but as I look at it from 30 years' use of manure—in some of which manure cost me $27 per car-load of 10 small tons—I think his premises are very much at fault, and so misled him. It is a most important question, because thousands of farmers are buying manure as I have done, and every farmer is interested in getting all he can out of it, so as to increase the yield of his crops as much as possible. Therefore I submit the results of my practice and the conclusions reached by a careful study of the science of manuring. I speak only of those crops which afford a choice of methods, such as grains, roots, potatoes, etc., and not of grass, which must be top-dressed, except at the first seeding.

Manure must be either fresh from the yard or stable or be well decomposed. Now, which of these conditions is the best in any particular case? Fresh manure is coarse and contains much undecomposed litter and the manure itself is raw and not fit for plant food excepting so far as it is soluble. Plants feed only by their roots, and absorb nothing but what is dissolved in water. But manure decomposes, and in the course of its decomposition gives up to water whatever becomes soluble in the process of decay. This process of decay goes on only when the manure is moist, for no chemical action takes place in the absence of moisture. When fresh manure, then, is spread upon grass land it begins to decay under "the free action of air and water" as Mr. Bliss truly observes. If this manure were constantly moist and rain was falling frequently, the manure would slowly become soluble and the soluble portions of it would be washed into the ground and down to the roots. But this is not the case, and when the manure is dried by the too free action of the air, then as it decays it gives off carbonic acid and ammonia, both free and in the evaporated moisture; these are lost in the air. When, however, the manure has been in the heap in the yard during the two months from February to April, it will have decomposed there under the action of moisture and heat much more than it could have done upon the surface of the field, and when spread in April the first rain would not only dissolve out of it the soluble portions, but would beat down the half decayed remainder into the grass, where it would be sheltered from the too free action of the air and would be saved from waste.

The heap of manure will *not* lose anything by evaporation and fermentation; and it *will* gain something from the atmosphere. A heap of fermenting manure is undergoing rapid decay and is being prepared for use as plant food. If it is neglected—I admit—it will lose considerably; but this neglect is not an element in the question. We are supposing every care that the good farmer can exercise is taken to avoid loss. Then, if he mixes plaster with the manure, as he should do, this will catch and hold everything—ammonia chiefly—that might escape in the watery vapor which is driven off in the form of the steam which we see escaping from manure heaps in cold weather. Moreover, manure cannot catch anything from the air, as Mr. Bliss suggests, excepting the oxygen which causes decay; on the contrary, it is giving out all the time it is decaying on the surface; and if there is any "trap" at all about it, to catch anything, it is the soil, as I shall presently show. For these reasons I would not spread manure upon even grass land until it was as much decomposed as possible, and most fit for food for the plants.

Now, as regards the application of manure to plowed land, the question becomes broader and deeper. Mr. Bliss says, "plowing, harrowing and cultivating the soil till doomsday will not convert a single particle of manure into plant food." This is an error. Porous earth is a disinfectant, and is used in earth closets and as an absorbent in stables solely because it will and does convert decomposing animal and vegetable matter into plant food, and this truth, and this property of pulverized soil, are the key to a sound solution of this question of plowing in manure. All porous substances are most effective oxidyzing agents. Everybody knows how rags or sawdust saturated in oil will heat and burst into flame in warm weather, and this is only an example of the same property which renders fine earth or sifted ashes so useful in the earth closets.

Now, when manure is left on the surface of the ground, as I have shown, there is a waste of most valuable plant food; but there is and can be none when it is plowed in the soil, and the more the soil is pulverized and made loose and porous the more plant food is developed from any organic substance in it, and even inorganic substances are also affected by this oxidation and by the carbonic acid which is liberated in the decomposition. When a farmer plows in the manure as it should be done, it lies in alternate layers with the soil, and these are set on edge, sloping with the surface 45 degrees or more, as the plowing may have been done. It does not then dry out but is kept moist; the sun's heat warms the soil and the dark manure absorbs the heat, and under the influence of the warmth and the moisture and the oxidizing effects of the pulverized soil, a vigorous chemical action begins, and never ceases. The "free action of air and water" circulating in the soil quickly decomposes the manure, and this in its decomposition dissolves the silicates of potash and soda and lime and the phosphates of these minerals in the soil, and thus not only is it converted into plant food but it actually converts mineral matter into plant food. Therefore it is not a "gross mistake"—friend Bliss—to cover manure with earth, as I hope I have been able to satisfy you.

There are some other points in the remarks of Mr. Bliss which I can scarcely refrain from noticing, although I am trespassing upon space and the patience of the readers. The heat of the soil is one point. Now, the total amount of heat in the soil during the year is far greater than that of the air and the surface of the soil. Porous soil absorbs a large quantity of heat from the sun during the day and holds it during the night. The soil may freeze on the surface for an inch or several inches, and yet maintain a temperature of 55 or 60 degrees below the frozen surface. This relative difference is constant. On one occasion of an early frost, which damaged my corn crop, the soil six inches below the surface marked 80 degrees on the thermometer, and this heat had been retained from the previous warm, bright day through the cold night.

The leaching of manure through the soil is another point that should be noticed. This is a common error. Porous substances, especially soil, have a remarkable affinity for solid substances in solution, and filter them out of the descending water most effectively. I had once a manure cellar in the sandiest of sandy soil, and all the liquids from a cow stable over it, which ran into this cellar for several years, failed to discolor the yellow sand more than three inches down. I have filtered the dark liquid from this cellar through a tube with eight inches of clear sand in it, and the water came out clear, free from odor and without any apparent taint. The same may be said of the soil. Moreover, there is a physical law of matter known as the law of diffusion, by which heavy carbonic acid is diffused through the greatly lighter air up to the highest elevations, and the heavy salt is diffused through the lighter ocean to the surface. This law prevails in the soil, and if one will scatter 600 pounds per acre of salt in a field of mangels, as I have done, and see it disappear in the soil, and fear it is gone—leached—out of reach, he will by and by be pleased to see it come up, when the soil dries, as a white crust on the surface where it is brought up by the moisture diffused in the soil. No, soils do not leach, unless the water is in great excess, and then the water escapes almost pure into the drains, carrying off only nitric acid so far as is known—and not all of it—from the soil. No farmer need ever borrow trouble about the manure leaching out of the bottom of his soil.

A MANURE PROBLEM.

THE manure problems in late RURALS call to my mind a case I noted a short time since. I visited a friend in Somerset Co., N. J. He is a good farmer of 40 years' experience. Last May he planted quite a large field to corn. The soil is a strong loam and the situation so high that water could not stand upon the surface. The field is of uniform fertility and a good clover sod. Before plowing, he hauled from the yard and spread on a part of the field coarse manure, at the rate of 10 loads per acre. He then plowed the entire field and upon another part of the same spread well rotted manure at about the same rate as before, and then harrowed until the surface was in good planting condition. Since planting, the corn has been so well worked that a man can convey the weeds of the entire plot under one arm, and yet, strange as it may appear, the corn is best by all odds where there was no manure. Who can explain?

Field Crops.

JAPAN CLOVER AGAIN.

IN the RURAL of September 11, it is stated that "J. W. W., of Macon Co., N. C., who advertises Japan Clover (Lespedeza striata) and other seeds for sale, and writes about them to several papers, is a fraud, etc.," and it is further stated that "this Japan Clover is worthless," and that "Walker's puffery of it is absolutely false." Now, though the party alluded to, in writing "to several papers," may have managed to get considerable free advertising, you may rely upon it that the Japan Clover itself is no fraud, neither is it "worthless," and all that was said of it by J. W. W. in the RURAL of August 28, has proved to be literally true in this section. Some ten years ago I procured from North Carolina a bushel of the "dirt" that was scraped up where the Japan Clover grew, and which was said to contain the seed. This was seeded according to directions on an acre in the middle of a 60-acre field, and it was stated that it would spread all over the field, and afford excellent grazing, all of which has turned out to be true, for that and Bermuda Grass were the only green grasses during the severe drought of 1885 in a standing pasture in grass for 15 years, and they both afforded excellent grazing when the other grasses were all dried up. I consider Bermuda Grass, as well as the Japan Clover, both to be valuable in all standing pastures; but the Japan Clover now seems to be pushing itself all through the Bermuda sod, and to be smothering that out. The Japan Clover starts early, and by July and August (when other grasses are failing) it forms a heavy, dense sod when grazed, and blossoms about September 1, having a small blue blossom at the foot of each leaf, and it affords fine grazing until it is killed by heavy frosts; but then it starts again the next Spring, spreading out more and more every year. It will grow and form a sod on the thinnest land, and even in the roads, and on galls and naked places where nothing else will grow, and on good lands, when not grazed, it is said to grow tall enough to cut for hay, and to make excellent hay in Lonisiana, where it is used for this purpose. The seeds are saved, and were advertised for sale last year, and a party here purchased a bushel (12 pounds) at $8, and express charges, and sowed them this Spring with the view of making hay and saving the seed.

The plant is said to have started in Charleston, S. C., (just before the war) from seeds found in a cargo of Japan tea, and has now spread itself, where it was never seeded, as far south as New Orleans and as far north as Virginia. It grows along the roads and highways and in all uncultivated fields, and no one seems to know whence it came, or how far it will spread. Mr. Edwin Montgomery, the editor of the Southern Live Stock Journal, considers Japan Clover "one of the most valuable grasses in the South," and Professor Massey, of the Miller School of Virginia, when on a visit to the Mississippi Agricultural College (where he first saw the grass) endorsed all the editor had said of it. No grass can be "worthless" that will cover the road sides and barren fields with a carpet of green and afford good grazing where nothing grew before.

I have no axe to grind and no seed for sale.

Spottsylvania Co., Va. A. P. ROWE.

REMARKS.—This plant comes from the eastern part of the Eastern Continent, and was first found near Charleston, S. C., about 40 years ago. Mr. H. W. Ravenel tells us that it was about 1867 that it first attracted the attention of farmers as a new forage plant. The farm papers were filled with accounts of it, and it was represented as a godsend to the impoverished fields of the South. It was surely to take the place of clover and grasses. The most extravagant accounts were printed. But it was killed by too much praise. It was finally found to possess *some* value, it is true, and we were scarcely justified in saying it is "worthless." On poor, sandy soil, it has a branching, procumbent habit and affords but little pasturage. On rich, damp soil it will grow as high as 18 inches. But the leaves are very small and the stems too hard and woody to make a desirable hay. Mr. Ravenel writes us that he thinks it will never be of any value as a crop to be cultivated like clover and the grasses, and we know of no better authority. It was Mr. Ravenel that named it "Japan Clover," though, of course, it is not a true clover. Neither is it a perennial. It is an annual. Now, the above is the most that can be said of this plant, and we hope it is not again to be puffed up only to disappoint all who purchase and sow the seeds.—EDS.]

The Herdsman.

STOCK NOTES FOR OCTOBER.

HORSES.

"No foot no horse;" therefore a most important point in caring for horses is to keep a

close watch upon their feet After the Summer's work is over, the shoes should be taken off and replaced, and the sole leveled and smoothed; but the frog should be left untouched. Unless the horses have work on stony roads or soil, it will be advisable to leave them unshod for a month or two, which will be a great help to the new growth of the hoof. Turn horses whose feet are at all tender into a damp pasture, or on to a smooth grass field. Keep a close watch on the smith when he is shoeing your horses. The horses are the owner's and not the smith's, and the smith for the time being is the owner's servant, and subject to his orders. Farmers should study the horse's foot and know all about it, and then compel the smith to shoe their animals according to directions.

Because the hard work of the Summer is over, it is not therefore right to cut off the horse's feed. This is poor economy. There will be hard work yet to be done, and the Winter with its rigors will soon be at hand. Full feeding should, therefore, be continued.

Galls of harness or collar that are found slow to heal, may be washed with warm water and soap, and then touched with a solution of sulphate of copper in water. A most excellent ointment for galls and wounds in horses is made as follows: Four ounces of clean lard, one ounce of Venice turpentine, one ounce of spirits of turpentine, one-half ounce of acetate of copper; melt and mix and stir until cold. Apply after washing and drying the part.

Give the horses half a peck of ripe apples every day; they will do them more good than a bucketful of medicine.

Brood mares that are in foal should get a feed of bran mash at least twice a week; it will be helpful to the foal, and the foal is to be considered as well as the mare. Gentleness with the mares while carrying the foal makes good-tempered colts.

Young colts should now get regular rations of oats. The first year of the colt's life makes or mars it. A quart at a meal twice a day is enough for the present, but as the colt grows, the ration should be increased to double this quantity by the end of the year. The colts should now be put in training for future usefulness. The first lesson is to use him—not break—never break a colt but train him—to a halter, and have a strong one so that he cannot break it and learn a bad habit. The next lesson is to accustom him to be curried and brushed, as the first coat is being shed; this should be done now when it will be agreeable to the young animal.

CATTLE.

Fattening beeves should now be pushed ahead. Pasture is deficient in nutriment, and should be made up by giving meal. The more finely the meal is ground, the better it is digested. A mixture of two bushels of corn, one bushel of rye and one bushel of new process linseed meal makes the best of fattening food for cattle.

Keep feeding cattle well carded and brushed, and see that the feet do not stand in filth. Sawdust or leaves make the best litter for keeping these cattle clean, and where straw is used it will pay to cut it fine in a fodder cutter to absorb the manure as well as for the sake of cleanliness. Salt is a true digestive agent and should be given regularly to fattening cattle.

Where a bull is kept for breeding purposes, he should be made to earn his keep by work. It is all the better for his usefulness, make him docile, takes the mischief out of him and keeps him healthy. Get a one-horse tread power and a fodder-cutter and a mill and make the bull do all the work of this kind.

Cows should be kept up to their milk by generous feeding. There is no profit in keeping any animal idle. An excellent ration for cows at this time of the year is two quarts, morning and night, of a mixture of the finest corn meal and bran in equal parts. This should be given to all cows that are necessarily kept on poor pasture, and a handful of salt should be given with it.

The present keenly felt necessity for an extra supply of fodder or a late pasture, should lead to efforts to supply the need another year. Cows should be on full feeding all the time, or they are losing money for their owners, and between grass and hay is usually a hard time for them.

The tall, coarse weeds which grow in the pastures at this season should be cut out; they are perennials and the easiest way is to sever the roots by a push with a heavy chisel fitted to the end of a light pole like a fork-handle.

To prevent the prevalent diseases of calves and young cattle give them some concentrated nutritious food. Linseed or cotton-seed meal furnishes an effective antidote to that common disorder black-leg (or anthrax fever), which carries off the best calves and yearlings in the Fall.

Pure water is indispensable for the health of all the farm animals, and at this season it is often scarce or wanting. Ponds and slow swamp streams are now full of decaying organic matter and are not fit for animals to drink from. Foul water of this kind may be purified by throwing into it a few shovelfuls of clay or clayey soil. Muddy water is far preferable to stagnant, putried water full of rotten vegetable matter.

Prepare the sheds and stables for winter occupation, and make everything close and tight. Put the windows in good order, but do not neglect sufficient means for ample ventilation. Pure air, if cold, warms the animal by furnishing oxygen, while warm, impure air chills it by affording too little of this warmth-giving animal fuel.

Nothing else will so help the flowing milk of the cows just now as a pailful of ripe apples chopped into slices and sprinkled with the meal. It pays as well to grow apples for the stock—if not better—as to grow roots in the field.

SHEEP.

Sort out the poor sheep. An old ewe will not pay to winter over and have her die in the Spring. The most profitable flock is that in which there are no wethers over two years old, and no ewes more than six. A good ewe that rears a good lamb every year will pay to keep as long as she will live, but this is an exception to the rule which should guide the shepherd.

If you have a few dollars to spare, buy a small flock of sheep with them, and make them a pen and a yard and procure a good thoroughbred ram two years' old to run with the ewes. Keep an account of the cost, and if everything goes right the money will be doubled by next Summer.

Cull sheep should be put up and fattened at once for slaughter or market. If the teeth are bad, feed fine meal with the best clover hay, and give the sheep a run in the day on a good meadow. Sheep do not hurt a meadow as cattle do. On the contrary, they leave behind them as much as they take and more if they get some meal and bran every day. Count the flock every time you see them; you may save a sheep by it. Give salt regularly once a week at least. The best plan is to keep a lump of rock salt in a field or yard and put a small roof over it to save it from washing. When sheep have a discharge from their noses, rub some pine tar on their lips that they may lick it off. It is the best antiseptic and tonic for them. Never give sulphur to sheep, although they need a supply for the nourishment of their wool and the yolk, which is necessary to keep the wool in good condition, yet it is better given in the form of food or some sulphate. Cabbage, turnips, rape and mustard supply sulphur, and a little sulphate of soda mixed with the salt will furnish the needed supply in the safest manner. Regularity in the management of sheep is most necessary to success. Reserve a few fat wethers and lambs for the domestic supply.

SWINE.

A dry bed is one of the secrets of success in the management of pigs; cleanliness is another. Avoid overfeeding store pigs. Crowd the fattening hogs; full feeding now fills them up and the final finish will take less food. After much labor and worry of mind, it has been concluded that pigs do best on dry, whole corn; and that it does not pay to grind their food, and much less to cook it. Some roots or vegetables are an excellent help in the feeding of pigs. One cabbage given twice a day will be found very acceptable and useful.

If young pigs are desired in March, the sows should be served in this month. This is an excellent time as a second litter may then be had in August. As a sow will rear two broods in a year as well as one, and her greatest value is for breeding, this period should not be permitted to pass by. All pigs should have exercise, even those that are fattening should not be kept shut up in a close pen. A roomy clean yard in which they can root as much as they feel inclined to should be provided. Manure yards and cellars are not healthful places for them. Young store pigs need clover hay when the pasture is used up, and if it is cut for them and mixed with the meal it will be eaten without waste.

POULTRY.

Provide a warm place for the young pullets, and the late brooding hens which will soon be in laying condition. Feed them well; wheat and bran mash with some rape seed are excellent food for them. Keep down vermin by the liberal use of crude petroleum; a barrel of it in the poultry house, used to paint the walls, nests and roosts, will keep all sorts of vermin at a distance. To encourage egg production, the following food will be found effective; potatoes baked and given hot from the oven—keep the smallest ones for this use—corn lightly parched and given warm; mush of ground oats and bran; put a little salt and some ground black pepper in this—chopped cabbage; and fresh bones broken small; no broken crockery or oyster shells will be needed, but a supply of fine gravel should be laid in for later use. Find a warm place somewhere for the late broods. They will make good spring chickens.

SORGHUM CANE FOR COWS.

For the past three or four years I have fed sorghum cane to milch cows. The cane was run through a cutter, and sprinkled with bran and cotton seed meal. I am satisfied that I got more and richer milk by its use; in fact, the more sorghum I feed the less mill feed I use, and I still keep up the yield of milk. I keep grade Jerseys, and sell butter in the Mobile market. C. C. WARREN.

Mobile Co., Ala.

The Poultry Yard.

GAME FOWLS.

I think the real merits of Game fowls are generally over-looked. Most people seem to think that Games are fighters and nothing more. Many farmers place the Game rooster among poultry about as they place prize-fighters among human beings. If they could study the breed a little closer their opinion as to its merits would improve. My best hen for an egg market is a cross between a Game rooster and a white Leghorn hen. The laying qualities of the fowl thus produced are not impaired, and the eggs are richer and more salable in a fancy market. It has been generally acknowledged that eggs from the Games are the finest known. For eating qualities nothing beats a cross of the Game rooster or a Brahma hen. There are plenty of poultry yards where a Game rooster could be used to great advantage. S. H. R.

Orange Co., N. Y.

HIGH-PRICED EGGS.

Speaking of dissatisfaction with high-priced eggs, I want to know what luck others have had. I bought some Wyandotte eggs and hatched five. Three of them are no more Wyandotte than I am. I have had bad luck before. My opinion is that it does not pay to buy eggs. I think it far cheaper in the end to buy good birds. You know then just what you are getting. I have heard one good breeder say that he had a great mind to stop selling eggs and confine his sales entirely to chickens. He has to make so many clutches good, and there is so much dissatisfaction that egg selling doesn't pay. I would like to encourage the buying of chickens. I think such a practice would give far greater satisfaction. A. L. W.

Queens Co., N. Y.

HENS IN THE STUBBLE.

My hens make money for me out of the wheat stubble. No machine can be made to cut so carefully that all grain will be saved. The hens find this waste grain far easier than a man can. It will pay to get enough wire fencing to make a portable coop and move it about from one place to another. In this way the whole field can be fed over. The hens will pick up their own living, and the manure will far more than pay for the trouble.

Ionia Co., Mich. H. C. J.

Miscellaneous.

LAW.

Secretary Gold's remarks under "What Others Say" in the last issue of the Rural New-Yorker with regard to the ownership of fruit on trees some of the branches of which overhang a neighbor's land, are good not only in morals but also in law. Even when the roots extend into the neighbor's land and draw nourishment therefrom, the tree is the property of the person on whose land the trunk stands, and he is entitled to the whole of the fruit, and if he is forcibly prevented from reaching over and picking the fruit by his neighbor, he has valid grounds for an action for assault and battery. Cases of this kind have been won in New York as well as in Connecticut. In the New York case (Hoffman vs. Armstrong) a lady stood on the division fence and tried to pick the fruit from the branches overhanging a neighbor's land; the latter forbade her, and when she persisted tried to prevent her, and in doing so did her personal injury for which she recovered $1,000. If the fruit falls into the neighbor's land, it does not become the property of the latter, but there is doubt as to whether the owner has a right to go on the land to recover it, as decisions on this point vary in different States. If done quietly without causing any damage, the courts would most likely sanction it. The adjacent owner, however, has a right to cut off the branches or roots of trees up to the line of of his land, but even then if he uses them, he must pay the owner whatever they may be worth. Where the tree stands on the boundary line, both parties own the tree and fruit in common, and neither can cut it without the consent of the other or remove the part on his land if thereby the tree is injured. In this connection, it may be remarked that every land owner has a right to plant as many trees as he may desire on his own land although they may make the house of a neighbor, near the boundary line, dark, damp or unhealthful. A landowner is responsible for damage caused by a poisonous tree extending over a neighbor's land, should cattle be poisoned by eating it, but if cattle trespass on his land by breaking through a feuce, and get at such a tree, he is not answerable.

Here are two recent decisions of the Courts which are of interest to farmers:

Exemption from Taxation.—A society which educates men in the diseases of the domestic animals, and the proper mode of dealing with them, and which inculcates the duty of humanity to them, is a benevolent and charitable institution within the meaning of a statute exempting such institutions from taxation, according to the decision of the Supreme Judicial Court of Massachusetts in the case of The Massachusetts Society for the Prevention of Cruelty to Animals *vs.* the City of Boston.

Discrimination in Rates.—A common carrier, such as a railroad, may make discriminations in rates based upon the quantities of goods sent by different shippers, but he cannot charge a higher rate to shippers who refuse to patronize him exclusively, according to the decision of the United States Circuit Court for the Southern District of New York, in the case of Menacho *vs.* Ward. The State laws differ on some points in various States; but a decision of the United States Courts is of wider authority, and, if confirmed by the U. S. Supreme Court, is applicable everywhere.

CATALOGUES, ETC., RECEIVED.

How to Fatten Fowls Artificially. Pamphlet from Brockner & Evans, 28 Vesey St., New York.—This firm manufactures the celebrated Gavuse-Martin Stuffing Machine, and this pamphlet is devoted to a description of the machine and the rations employed in producing the remarkable feeding results which French poultrymen have obtained. French poultry is famous. The birds that so delight the epicures of Paris are fattened by this system. The birds are stuffed; that is, semi-liquid food is forced down their throats and they are left to digest it as best they can. The birds are confined in revolving coops; a tube is placed in a bird's mouth, when by touching a spring a quantity of food is pushed down the throat. The food consists of barley and buckwheat mixed with water and milk. The process is interesting and in France, at least, very profitable. Those who desire to know more about it should send for the pamphlet, which will be mailed for 10 cents.

Missouri Grain Drill. Pamphlet from the Genesee Valley M'f'g Co., Mt. Morris, N. Y.—This drill is praised as the lightest, cheapest and best in America. It has been well tested in sowing all kinds of grains and fertilizers. The feeders are inclosed in iron cups beneath the box. The quantity sown is regulated by the speed of the feeders. It can be varied from three pecks of wheat to three bushels of oats. The fertilizer attachment works admirably. Many excellent testimonials are given. Besides this grain drill, the company makes an excellent land roller, the "Little Tiger" fanning mill, Fargo's patent harrow tooth, and a water wheel.

Osgood's Scales.—Catalogue from Osgood & Co., Binghamton, N. Y.—Those of our readers who want to read an essay on scales, that will fully explain their making and working, should send for this catalogue. It is well written, and makes the whole thing clear. It pays to have reliable scales on the farm. Many farmers have saved the cost of a pair in two seasons by weighing their stock and wool at home before it was taken to market. When merchants and agents know that there are scales at the farm they are pretty apt to give square weight. There are hundreds of ways in which the scales can be made useful. Those who think of supplying themselves will do well to examine Osgood's catalogue. There are thousands of these scales in use, and from the numberless testimonals received it is evident that they have given great satisfaction. If, after studying this pamphlet, the reader does not understand the mechanism of scales, it is his own fault.

Racine Windmill. Pamphlet from the Winship M'f'g Co., Racine, Wis.—A concise and readable pamphlet, in which the merits of

this mill are well set forth. The Racine Mill is self-governing, and can be safely run during a gale if necessary. It is made of two sizes, 10 and 12 feet diameter respectively. It has a sectional wheel composed of six and eight fan sections. The motion is communicated by means of wrist-pin and pitman. The work throughout is strong and simple. The mill will be sure to please. A full description of the mill, as well as directions for erecting a tower, will be found in the pamphlet. Besides the windmill, the company have for sale pumps, tanks, and Eureka sand-papering machines.

FEED CUTTERS.—Circular from Dick's Agricultural Works, Canton, Ohio.—These cutters can be used in cutting hay, straw, cornstalks and silage. The corn-stalk splitter attachment is an excellent feature. A series of steel bars are arranged so as to cut at right angles to the cutters. These split and crush stalks or cobs as they are cut off by the knives, so that the feed is turned out much finer than when they are not used. These bars can be easily removed when it is desired to cut hay or straw. The cutters are made of various sizes with knives from 7½ to 16½ inches in length. The larger sizes when run by a suitable power are capable of making 1,800 cuts per minute and cutting 4,000 pounds of feed in an hour. We believe these cutters to be simple, durable and effective. Farmers will be greatly pleased with them.

DANIELS' PLOW SULKY.—Circular from E. B. Daniels & Co., Havana, N. Y.—The time has gone by when a plow sulky is to be considered one of the luxuries of farm life. It is fast becoming a necessity wherever any great amount of plowing is to be done. The Daniels' sulky is claimed to be the lightest and simplest made. Any plow can be attached in five minutes' time so that the farmer who desires different plows for different kinds of work can easily adjust them to suit. The foot lever is an improvement to be found only in the Daniels. By means of this lever the plow can be firmly held in the ground, slightly raised so as to skim the earth, or pulled entirely out of the ground. The superior qualities of the Daniels Sulky are well set forth in the circular. Those of our friends who think of procuring a sulky are advised to send to the manufacturers for catalogues, etc.

What Others Say

WHEAT EXPERIMENTS.—Bulletin No. 8, of the Purdue University (Lafayette, Ind.), gives an account of wheat experiments. Forty-nine differently named wheats were sown side by side under conditions as nearly identical as could be secured, September 24–6 with a two-horse drill at the rate of one bushel per acre. Again the Velvet Chaff takes the lead, yielding nearly 30 bushels to the acre, weighing nearly 63 pounds to the bushel. This is described as a bearded variety with medium-strong straw and large, red grains ripening June 27. All of the Velvet Chaff wheats which we have tried are late, and the heads mildew and the kernels shrivel. Diehl-Mediterranean yielded 17 bushels, weighing 60 pounds. The straw was "very strong," the grain large and red. It ripened July 2. Two different kinds called Michigan Amber were raised. The first yielded 23 bushels, (60 pounds), ripening June 28, strong straw, smooth head, medium red grain. The other yielded 26 bushels (60 pounds), ripening July 1, stroug straw, smooth head, large, red grain. Of the latter only five per cent. was winter-killed; of the former 40 per cent. Martin's Amber yielded 21 bushels (59 pounds) strong straw, smooth head, medium amber grain, ripening July 2. Landreth (Armstrong) yielded 21 bushels (58 pounds), ripened July 1, smooth, medium, amber grain. Lancaster yielded 26 bushels (60 pounds), ripened July 1 weak straw, bearded, large red berry. Red Russian yielded 28 bushels (62 pounds), ripened June 30, medium stroug stem, smooth head, medium-sized, red grain. Clawson yielded 25 bushels. Smooth Velvet Chaff yielded 24 bushels (62 pounds), ripened June 27, medium strong stem, large, red berry. This name has been changed to Dietz Long Berry. The other varieties were remiss in yield or strength of straw, so that we need not speak of them. Professor Latta's comments are:

"The Velvet Chaff continues to hold first rank, everything considered. It was this year the most prolific wheat grown at the College, and is as hardy as any. The straw is not strong enough to stand well on very rich soils. The heads, which are strongly bearded, curve downward when ripe, making the sheaves quite bushy and difficult to shock compactly. The Finley, Fultz, Haines, Hedges' Prolific, Hickman and Hicks Wheats resemble each other in general characteristics of both straw and grain. They are not hardy here, but when the Winter is not too severe they produce a good yield. The grain is too small, however, to be generally popular with millers. Tasmanian, Tuscan Island, Mediterranean and Lancaster are apparently identical. They closely resemble the old Mediterranean.

Diehl-Mediterranean and Lovett are two very different wheats that might be mistaken for each other when standing in the field. Both have very stiff straw and erect bearded heads with bronze chaff. The former has the larger head and produces a large red kernel, while the grain of the latter is a medium-sized amber. The Diehl-Mediterranean produces fine wheat in favorable years, but is seriously damaged by hard Winters. The Lovett is unworthy of further cultivation here. The German Amber and Red Russian are good, smooth wheats, resembling Fultz when standing in the field, but they are later, more hardy, and produce larger and heavier grain. Smooth Scott, Emporium Scott, Badger, Rogers and Zimmerman are all smooth wheats of the Fultz type, both in appearance and hardiness. Martin Amber and Landreth are almost identical in characteristics. They have not sustained, here, the high reputation they have borne elsewhere. They are not hardy enough to endure severe Winters. Being rank in growth and late to mature, they are not well suited to the dark, rich soils of this section of the State. Arnold's Gold Medal, Arnold's Hybrid, Champion Amber, Dott and Michigan Wick are not considered worthy of further trial on the College farm.

Eight pecks of seed per acre gave the highest yield, viz: 35 bushels. Seven pecks gave 33—six pecks 33—five pecks 32—four pecks 30—two pecks 28. Rolling after seeding did no good, though the soil was not dry. Mulching increased the yield over three bushels to the acre. Our own mulching experiments have increased the yield far more than that, but we have no exact figures to present. But the mulch must be applied evenly and to do this by hand is a tedious, costly work. Prof. Latta says that "Kemp's manure spreader will scatter the straw quickly and evenly, and those who own, or can get the use of this implement can mulch a few acres of wheat with slight expense."

HOME INDUSTRY—HAPPY THOUGHT.—Liquor dealers pay on an average $2 per gallon for whisky, says the Farm and Fireside. One gallon contains an average of 65 drinks, and at 10 cents a drink the poor man pays $6.50 per gallon for his whisky. In other words he pays $2 for the whisky and $4.50 to the man for handing it over the bar, to say nothing about the water added. Now, if you must drink, make your wife your barkeeper. Lend her $2 to buy a gallon of whisky for a beginning, and every time you want a drink go to her and pay her 10 cents for it. If she waters it 25 per cent., which will be none the worse for you, by the time you have drunk a gallon she will have $7.12, or enough to refund the $2 borrowed and have a balance of $5.12. She will be able to conduct further operations on her own capital, and when you become an inebriate, unable to support yourself, and shunned by respectable persons, your wife will have money enough to keep you until you get ready to fill a drunkard's grave.

SEASONING BUTTER WITH BRINE.—Prof L. B. Arnold, in the Farmer's Advocate, says that those who are far enough along to appreciate the difference between gathering butter in a lump and handling it in granules, are in a position to adopt brine seasoning with ease and a decided benefit. All that is necessary for such a butter maker to do is, when his butter has come, to wash in the usual way with water till it will run off clear, and then immerse the granules of butter in brine as strong as it can be made, and let the butter lie in it the same length of time he would to have the salt dissolve if he had used dry salt, and then press the butter into a solid form, avoiding any friction or grinding motion while reducing it to a solid. In this way all working will be avoided, and the butter be left in the best possible condition for keeping, and have an even color and the highest flavor it is possible for it to have. By lying in strong brine a few hours, the brine will draw the water out of the butter the same as dry salt would.

Brine makes a more even distribution of the saline flavor than dry salt can do, and it will relieve the butter of any excess of water it may contain just as readily as salt in crystal can, and put it in readiness for packing in as little, if not in less, time. It is by some supposed that salt strikes into butter better if dry salt is worked into it than it would if covered with brine, but this is a misapprehension of the action of salt—neither salt nor brine strikes into butter at all. There is no affinity between salt and butter or brine and butter. In seasoning butter with either, the salt remains in butter only as a foreign body mechanically mixed. When butter is gathered in the churn in granular form it is never overchurned. Pounding it after it is in a lump or large masses is what overchurns it. In seasoning with brine it is never overworked, as it is not worked at all. Working out buttermilk and working in salt is where the overworking comes in. In fact, working at all is overworking, because, by the improved method, none is needed, and breaking the grain of butter by grinding in crystal of salt is also obviated by seasoning with brine.

Notwithstanding the many advantages of this mode of treating butter, it will, no doubt, be a very long time before every butter-maker will adopt it. But the new way is so much easier and better that time will fetch them in, and the butter-worker and seasoning with dry salt will become a thing of the past.

WHENCE DO PLANTS GET CARBON?—The agricultural editor of the N. Y. Times says that the value of carbonaceous matter for manure is generally supposed to be very little or nothing. The prevalent opinion is that plants get all the carbon they require from the atmosphere. The same opinion was once held with regard to nitrogen, but it is now stoutly denied. It may soon be the case with regard to carbon. Many intelligent and experienced students doubt the truth of the prevailing opinion now, and many farmers are using carbonaceous substances, such as the waste from sugar factories, with positive and marked benefit to their soil. Practical farmers have long believed that bulk in manure had a considerable value, and certainly the bulk of a manure pile consists of carbonaceous matters. This subject is of present interest, because at this season the farmer who is intent upon enlarging his stock of manure is laying plans for gathering the leaves, swamp muck, and other carbonaceous materials, and he may take encouragement from the fact that he is probably supplying to his land in these bulky matters precisely what it requires, and those materials which will supply to the soil a large quantity of carbonic acid as the product of their decomposition.

WHAT SOME CONSULS SAY.—Consul Dufais, of Havre, in a report to the Secretary of State, describes an abortive attempt on the part of commercial and labor organizations to secure a repeal of the decree against American pork. He concludes: "All hopes of a favorable change have been abandoned by those opposed to the prohibition. The millions of ill-paid and scantily-fed laboring men of France will continue to pay tribute to the French hog-raising farmer."

Consul-General Bonham, at Calcutta, reports that it is reported in Calcutta that the cattle plague, known as the "rinderpest," prevails in parts of the Madras Presidency. Large quantities of baled hides (dried and salted) are shipped from India to the United States. He calls attention to the question of cattle in America contracting the disease from the importation of these hides.

Commercial Agent Smith, of Mayence, says that the new American method of drying fruit, which gives such satisfactory results, especially with apples, is susceptible of being developed into an important industry.

MULTUM IN PARVO.

ONE kind of apple tree will yield you bushels of apples, while others will yield you pecks. Which are you going to choose if setting a new orchard? Or don't you care? In the latter case, order of one of the tree agents that visit your locality. In the former case, study the question. Consult the catalogue of the Am. Pom. Society; consult the nearest successful apple grower .....

MR. J. B. OLCOTT has once seen purslane in Hartford (Ct.) markets, but never on a farmer's table since he was a boy. Yet if the tender shoots are cooked like spinach, he says purslane is really one of the most wholesome things the round globe furnishes .....

THE Superintendent of the N. H. Ag. College gives the N. E. Farmer an account of an experiment in rapid butter-making by the centrifugal process. At 4.30 A. M. the help commenced milking. At 7 the butter was on the table at the college farm house.....

"THERE was an unusual amount of gambling in connection with the New England Fair," says the above journal.....

MR. T. B. TERRY'S (Ohio) experience with Farly Ohio Potato is much like our own. He thinks it is the earliest good potato in cultivation, for which reason as well as because its vines are very dwarf, it should be grown in rich soil with the hills nearer together than with other kinds..... .....

JUST to show what can be done with early-cut clover and timothy hay, Mr. Terry says in the N. Y. Tribune that he has a team of rather heavy work-horses that for almost five years have lived on this diet. They have not had during all this time one single feed of grain of any kind. They are fat as seals, and at no time during the five years could one see a rib on either of them. To take a big load of potatoes or wheat to market, twelve miles, is but play for them. Mr. Terry would like to see a farmer keep horses in any such order on late-cut hay and do the same work that his do. His practice certainly shows that there is great virtue in properly dried grass and clover. Many a time has a visitor said to him, "I cannot keep my horses so fat as yours on hay *and* grain." He is confident that he has made hundreds of dollars by cutting his hay at just the right time.....

DON'T flatter yourself, says Mr. Holmes, that friendship authorizes you to say disagreeable things to your intimates. On the contrary, the nearer you come into relation with a person the more necessary do tact and courtesy become. Except in cases of necessity, which are rare, leave your friends to learn unpleasant truths from their enemies; they are ready enough to tell them.....

MR. HOLMES also says that insanity is often the logic of an accurate mind overtasked. Good mental machinery ought to break its own wheels and levers, if anything is thrust among them suddenly which tends to stop them or reverse their motion. A weak mind does not accumulate force enough to hurt itself; stupidity often saves a man from going mad.....

PROF. BUDD (Ames, Iowa) thinks the Champion the best very early grape for his climate. Next in order, he says, is Moore's Early. "It is a treasure rapidly coming to the front in the Northern States".....

MR. CHARLES GIBB of Canada (Abbotsford P.Q.,) says in the Montreal Horicultural Society's Report, that Weir's Cut-leaved Maple is a curiosity; an eccentric, wayward grower. The foliage of the young growth is so slender and so deeply slashed as to be scarcely recognizable as a maple. He recommends it as a tree thoroughly suited to his climate.....

THE Cut-leaved Maple (dissectum) is a variety of the Norway. The leaves are so deeply cut as nearly to divide them in three parts. At the Rural Grounds this tree is highly prized for its compact growth, ample foliage and comparatively slow growth. It is a grand tree for small places.....

MR. GIBB praises very justly the tree we have often talked of in our columns, viz; Schwerdler's Maple, also a variety of the Norway. The leaves as they unfold in the Spring are a brilliant crimson, and this bright color continues until they are fully grown. They then grow darker, finally changing to a dark green. The leaves of this tree before becoming a dark green are sometimes nearly black for a few days with us..... ....

ANOTHER curious variety is the Curled-leaved or Cucullatum. Mr. Gibb mentions that the leaves curl into strange forms while the structure of the leaf and the way in which the veins radiate are remarkable .....

MR. GIBB justly praises the Imperial Cut-leaved Alder. It is an aerial tree. Its light, feathery foliage and dark, dull color give it an expression peculiar to itself. It is quite hardy in Lower Canada.....

YOUNG'S Weeping Birch is a tree that might well take the place of the Kilmarnock Willow. Top-grafted it is just as pendulous and more graceful and, what is important, longer lived.....

G. W. WILLIAMSON, of Mattituck, L. I., says that he has used sulphate of ammonia, bone-black, and muriate of potash, to the value of $20 per acre, for a number of years, and finds that his crops grow better and better every year..... ....

FOR the last two years he has put it on broadcast for potatoes, and says it saves labor and produces a more uniform crop, although somewhat slower in maturing. .....

HE goes over his potato ground with a horse rake before beginning to dig, and says it cleans the ground and materially lessens the labor of picking up the potatoes.....

IN the potato-growing sections of Long Island the Burbank seems to be the favorite. So far it has been freer from rot, and has commanded better prices than other varieties....

Everywhere.

TRANSCONTINENTAL LETTERS.—LXV.

MARY WAGER-FISHER.

A Spring visit to Monterey; the "old town;" the environs; the "Drive;" wheat and fruits; malaria; the question of irrigation.

SUCH readers of the RURAL as have read my letters from the outset, may recall those descriptive of the Santa Clara and adjacent valleys and the charming towns that lie in them between San Francisco, Monterey and Santa Cruz. We made the trip in August, 1884, when the hills and fields were brown from the rainless Summer; but when the time came for leaving Central California it was the last of March and we could not well resist

the temptation of seeing this beautiful valley in the green of the year, and so paid a second visit to Monterey and its environs. Of course, everythiug looked at its best. The road lay through unbroken stretches of wild flowers. The Coast Range on one side and the Santa Cruz Mountains on the other rose like undulating ramparts of amethyst on either hand, while the beautiful Bay of Monterey, flecked with pleasure and fishing boats, never looked lovelier. We went first to the Hotel del Monte with its 126 acres of lawn—a stretch of unparalleled beauty, where it is more Summer in December than in July, and where the world seems to bloom unceasingly—pelargoniums trained up like trees, a single stalk six to ten feet high; great Live Oaks bent in most picturesque forms, often the top of the tree as near to the ground as the first branch—a place where there is more beauty, comfort, elegance and cleanliness than can be had elsewhere in the world in the same length of time and for the same money. I think no one can recall this incomparable place without a feeling of enthusiasm that borders on daftness!

We spent four days there and saw many things that escaped us on our previous visit. The old town of Monterey abounds in curious interest, and is still intensely Spanish—an indolent race and largely intermarried with Indians. We drove one day through the town with great difficulty, because of the ditches and gulches in the streets, which kept our horse in constant fear. There are rows of old adobe houses, long and low, with curious tile roofs, most picturesque with vines and flowers, but probably dark and unwholesome to live in. I went into the old graveyard, where the wooden inclosures were painted black and white and the stones bore Spanish inscriptions, past the old Mission church, with its pretty pale-yellow front and bell tower at one side, the priest's house with an arch of whalebones over the gate and the walk up to the door paved with whales' vertebræ! Near a bridge on one side of the town is a high wooden cross, marking the spot where the old priest Juniper Serra, who founded so many missions in California, landed June 3d, 1770. Very near are the remains of Fremont's Fort and the whale fishery—two whales having very recently been caught—and numbers of great casks about to hold the oil.

One day, immediately after breakfast, we started out for a tramp of seven or eight miles, coming back loaded with wild flowers—new to us—and sea mosses and shells. Two miles or more of the way lay through a wood, with blue Iris blooming in the greatest profusion. On the beach and banks the eschscholtzia shone, and in the sand sprawled pink and yellow abronia; but the flowers were legion and in great variety. We were beyond the bay, and the sea rolled in on the large water-worn rocks superbly, a sight one never tires of. Sea lions sported in the waves. On stretches of sandy beaches between were washed up mosses, sponges and brilliant shells in furrows. The laddie took off his shoes and stockings, waded in the water, and poked his toes in the sand as fine and white as driven snow, to his heart's content. All in all, it was the finest, delightfullest day I ever had on the seashore anywhere. But I got so tired upon our return in crossing a space of sand dunes, where we sank into the sand to the tops of our shoes, that I gave out completely and lay down on a bed of sand for a half hour's nap in which I recruited—and a most comfortable bed it was, with the warm sunshine for a covering.

On another day we went on what is called "The Drive," a beautifully made road along the beach, and through woods and meadows; the greatest interest in this drive is centered in the cypress trees—the only surviving remnants of an almost lost race—unhappy with many youthful descendants planted all over California now. But these old trees, blown and beaten, may be for centuries, by the sea storms, are the most frantic, wierd and ghostly tree forms possible to imagine, and have made the Monterey cypress famous in the annals of tourists.

Of the many beautiful flowers which we collected in this drive, none delighted me more than a species of gooseberry growing in the woods—one solitary shrub—Ribus speciosus I think. The leaves were cunningly arranged along the top of the twigs and branches, while from the lower side depended long, brilliant red flowers, like a fringe of glowing fuchsias.

While all the country about Monterey is very beautiful, it is not especially valuable for its productiveness. In the valleys, however, the soil is excellent, and in a state of high cultivation—a great wheat and fruit region. But unless the San José scale can be speedily disposed of, the fruit grower in California will not line his pockets with gold. I have heard of a "lady bug" which is being introduced with some hope of exterminating the pest, as it feeds upon it.

Anent malaria, I must modify a statement made in the RURAL, that no chills and fever exist in California within a hundred miles from the sea coast. There is malaria everywhere in the State where there is irrigation; in the towns where the sewerage is defective, and in many places within but a few miles of the sea coast. There is malaria—chills and fever—in certain quarters of San Francisco and Oakland, both of which are immediately on the salt water. None of the valleys are good for consumptives or "rheumatics"—the former should take to the mountains, but I haven't the smallest idea where the latter should go. I found the winter climate charming—none better could be desired; but the long, rainless Summers which seem to suit the exigencies of farming where water for irrigation can be had, seem to me intolerable.

The most important question before California farmers is that of irrigation—of riparian rights, which breed endless trouble and which can only be settled by State interference and control. Upon the water supply depends the future development of the State—the possibilities of small farms and small farmers.

RURAL SPECIAL REPORTS.

Alabama.

MOBILE CO., September 16.—Our early Spring was unfavorable to all early crops, very cold and backward. On April 6 and 7 we had frost, something I have never seen before in a residence of 16 years. Since then the season has been fine for all crops. Corn crop heavy; sweet potatoes began to come in about a month ago, supply now abundant and cheap. The past two weeks have been fine hay weather, and farmers generally have saved most of the early crop, but late cornfield clover remains yet to be cut. Sugar cane promises to be an abundant crop, being now eight to ten feet high and heavy on our piney woods land, where well manured. Sorghum cane is now ripe and ready for grinding. I find this cane has some advantages over the tropical cane, as the cane worm does not trouble it, the fodder is good feed, and more seed can be made to the acre than of corn, and I find it good food for all stock and chickens, and it can be got out of the way before potato digging time. Turnip fields and cabbage beds are growing finely.

C. C. W.

Illinois.

CHICAGO, Cook Co., September 20.—I have passed over in daylight the country from Buffalo to Cleveland and from Cleveland to Chicago, and all along the line of that route I could see the marks which the dry weather had left. First, the pastures were very short; and, secondly, the usual amount of fall plowing had not been done. But as I drew near Chicago the conditions were more favorable. The ground had been plowed, and the newly-sown winter wheat was just beginning to come up. Extending my travels 150 miles south of Chicago, the same state of things existed, but only in a more exaggerated form. The pastures were shorter, the effects of the drought more visible, and scarcely any plowing was done at all. In fact, hardly a furrow has been turned in the last 14 days in Illinois, Missouri or Kansas, but very fortunately, however, after a drought extending over 57 days, this state of things has come to an end, and we have now had during the last 60 hours, with the exception of Missouri and Kansas, all the rain we need to start up full pastures, and give us feed until frost and put the ground into condition for plowing. We are doing so much better farming now, not only in the spring wheat, but also in the corn belt, that fall plowing has become absolutely necessary to successful farming, and when farmers in the Fall of the year in this part of the world are not able to prepare the ground, the outlook for spring crops, both as to acreage, quality and yield, is by no means reassuring. The seeding of winter wheat is somewhat backward. The only State which has had enough rain for fall seeding so far has been Michigan, and there seeding has for the last 10 days been more or less delayed on account of the ground being too wet. We had a slight frost in Illinois last night, but there have been no killing frosts. At least three-fourths of the corn crop of the entire country is now out of the way of a killing frost. From what I have seen and heard during the last few days, I think now that when farmers get into their crop of corn and begin to gather it the reports as they come to me will be that the crop is fully as poor in quantity and poorer in quality than has been reported. R. M.

Iowa.

MENTOR, Bremer Co., Sept. 14.—A good corn crop. Oats fair. Wheat heavy. Potatoes a failure. Flax and hay fair crops. A very dry Summer. Cattle have to be fed. Recent rains make the pastures look a little green. Corn is nearly all ripe. E. E. F.

Michigan.

SEARS, Osceola Co., Sept. 14.—This has been a very dry season—from May 16 till August 21 we have had very little rain. Since that time we have had plenty. All spring crops were injured more or less. Hay half a crop. Potatoes about the same. Oats and barley light. G. W. D.

Montana.

FRIDLEY, Gallatin Co., Sept. 14.—We have had only one frost yet, and that did not hurt tomatoes on the vines—merely nipped the top of the vines, and saved cutting back to ripen the fruit. I presume I have now 20 bushels of tomatoes in the garden, and quite a number of them ripe. I have picked ripe ones for nearly two weeks for table use. I am satisfied our Yellowstone Valley will eventually be producing plenty of corn. All it requires is to plant and attend to it. B. P. VANH.

Texas.

SHERMAN, Grayson Co., Sept. 13.—All through Western Texas the long spell of dry weather—over a year in some places—has done a world of mischief. Thousands of head of stock have perished, and others have been nearly famished and had to be sold at a ruinous price. Cattle are now selling at $5 to $5.50 per head, and the best beef stock at two cents per pound. Other stock bring only proportionate figures. Those who depended on crops couldn't raise enough to support life. Whenever I go to town on business I see plenty of covered wagons winding their way to some place where work can be found to support life. At the time when I made my crop report, corn looked fine, but the drought has made it fearfully short. The best pieces will make scarcely 15 bushels to the acre; while thousands of fields will not make as much good corn per acre as was planted last Spring, and propably the crop is better in this county than in any other in the State.

THE FARMERS' CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

QUARTERS FOR CHICKS.

G. T., W. Alexandria, O.—What is a good brooder, and how large should a building be to accommodate 700 chicks?

ANSWERED BY H. HALES.

In raising chicks in brooders it is very essential not to crowd too many in one compartment, however large. They do not thrive as well as when smaller numbers are kept in small compartments; 75 chicks in a space 6x14 feet will do well till four weeks old, when they require double the space; or, better, separate them into two compartments of the same size, 35 or 50 to each 6x14 feet, with a run outside. The runs should be partitioned off to prevent crowding the same as the inside compartments. In these last accommodations they may be reared till two or three months old, when they are large enough for broilers. The size of the building will depend upon whether it will be one or two stories, or double tiers of coops, as many breeders keep the little chicks on a second story or upper tier till four weeks old, and then bring them to the ground floor to the pens with outside runs attached. The ratio of 84 feet for 75 chicks, or for 40 when over four weeks old, should be maintained, whatever the size of the building. With proper brooders the interior fixtures are few—a drinking fountain, a food trough with wire guards to prevent the chicks from getting in to foul themselves and the food, and plenty of dust on the floor, are all that is required for each pen. If the floors are not covered heavily with dust or dry earth, a low dusting tray placed where it can receive the sunshine may be substituted. It is difficult to name the best brooder, as there are many on the market of nearly equal merits, especially of the latest designs. The best is cheapest.

TANNERY ASHES.

G. B., Coatesville, Pa.—Dr. Kedzie gives the value of an average specimen of tannery ashes as $4.50 per ton. This is a fair estimate, yet no man can give the value of any sample until he can see and examine it. It makes a great difference whether the ashes have been left exposed to the rain, or whether they have been sheltered. Such ashes would be valuable as a dressing for land occupied by peach trees or small fruits, but we could not say without seeing them whether it would pay to haul them three miles or not. It certainly would not pay to give much for them if the roads are bad or if other work can be had for the teams.

CYCLAMEN CULTURE.

W. F. Y., Shelborn, Ont., Can.—Cyclamens should be re-potted at this season. Shake all the old soil off entirely; pot in a light, rich soil, such as you would give geraniums. Do not entirely cover the bulb with soil, but leave the crown bare. Water whenever dry, but do not let the soil become sour and waterlogged, and do not let the pot stand in water. They should flower readily and profusely under this treatment.

Miscellaneous.

B. B., Farmingdale, Ill.—1. The American Chestnut fails to fill well in the West; does the Japan chestnut fill properly here? 2. Is the Prunus Simonii (Simon's Plum) free from attacks of curculio, as some claim? 3. Are cions from a dwarf pear as good as those from a standard for propagating purposes? 4. Is the original Mount Vernon Pear tree still living, and who owns it?

ANS.—1. We cannot answer this question. 2. We cannot raise plums at the Rural Grounds except by jarring the trees. Our only specimen of Simon's bore one plum which was not injured. Further we can not say. 3. There is no difference; one is as good as the other; 4. It was a chance seedling on the grounds of Samuel Walker, at Roxbury, Mass. We don't know whether the tree still survives.

H. H. L., Bainbridge, N. Y.—I got a number of settings of White Wyandotte eggs from a poultryman whom I have hitherto always regarded as honest. At least two-thirds of the chickens are colored. Some seem certainly mongrels, while others look like Laced Wyandottes. Have the chicks "harked back," or was I swindled?

ANS.—Our impression is that there is not yet any strain of White Wyandottes that will breed true. We should be glad to hear from others.

W. L. M., Clinton, B. C.—The grass sent for name is Setaria glauca—Bottle Grass. It is nutritious, but not very productive. The wheat is a very poor specimen of the Seven-headed or Egyptian. It yields well in many places as a Spring Wheat and we once carried a few plants through the Winter.

F. A. H., Beattie, Kans.—Gardening For Profit by Peter Henderson will give you the desired information. Sold by Peter Henderson & Co., New York. Price, $1.25.

"A Sub.," Shelby, O.—We do not know the character of the land about which you inquire.

A. Hatherly, Lapeer, Mich., wishes the address of breeders of pure-bred Suffolk swine.

DISCUSSION.

W. B. B., MENOMINEE, MICH.—In the RURAL of September 4th, O. H. B., of Hutchinson, Ky., asks what causes his tomatoes to rot upon the vines before maturing. My experience goes to prove that the soil is too rich. For the last few years I have put my tomatoes on the poorest soil I have had where there was no manure, and have had no trouble with rot. A tomato worm is something I have never seen here. Some of my neighbors whose tomatoes are on heavily manured ground have hardly a sound tomato.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING September 25, 1886.

FOR FLORISTS, A SPECIALTY.

CARMAN RASPBERRY This NEW Extra Early Black Cap is now offered for Sale, and is likely to work a REVOLUTION in the market growing. VERY PRODUCTIVE. Fruit of **largest size, Jet Black,** and the **earliest** *of all to ripen.* Sells at highest price. **Best** quality for family use. Also **EARHART** Rasp., a valuable novelty—fruits from June to Nov. Pot STRAWBERRIES and all best varieties Small Fruits for Fall planting. Cheap for choice stock. Circulars free. **Hale Bros.,** South Glastonbury, Conn

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, OCTOBER 2, 1886.

WE can confidently recommend our readers to try a plant or so of the Earhart Blackcap Raspberry. In the way of so-called ever-bearing raspberries we certainly have never seen anything to compare with it. Even though it bore but a first crop, we should value it for its productiveness.

WE do not hesitate to state that we have had 20 different samples of Treadwell Wheat sent to us as so many new varieties. In some cases it is found in a field of Clawson, Fultz or Mediterranean; in other cases it is said to be the result of a cross! Much of this is owing to the fact that samples of Swamp, Silver Chaff, etc., sent out by the Washington Seed Dep't, were mixed with Treadwell.

THOSE in the Middle and Northern States who have not tried the Longfellow Flint Corn, should do so. The ears with us average 12 inches long, eight rows, and 60 kernels to the row. Ears 14 inches long are not uncommon. The plants in a rather poor soil grow from six to seven feet high, suckering somewhat, bearing from one to three ears. Among flints it may be called a second early, requiring about 105 days in which to mature. The rows of kernels are always straight and close together—the cob small. For a main crop flint corn we know of no better variety.

SEPT. 21. The first frost at the R. G. —a light one. Now we are ready to sow wheat—or plant it rather, since every kernel is dropped by hand in drills a foot apart, and varying in the drills from one to 10 inches, according to the quantity to be planted. We have now 100 or more crossbreeds or hybrids to plant in this way—all to be kept separate with great care; each to have its stake and name and a full record to be written in our record-book. It is very tedious work: still we enjoy it. If the way of the experimenter were altogether delightful, the market would be overstocked.

SOME farmers seem to think they can estimate the value of manure by smelling of it. Perhaps they can if they learn to discriminate between smells, but not while the idea holds that the stronger the smell the richer the manure. Sulphuretted hydrogen, found in rotten eggs and other decaying substances, is one of the worst odors, yet it indicates no particular fertilizing value. Manure may be so malodorous that a man can hardly work it, and yet be of little value as plant food. The peculiar odor of ammonia is easily detected. When that is detected about a manure pile we are safe to conclude that the manure is valuable, but that it is losing its life, and that we need to apply plaster or take other measures to hold the ammonia.

THE Bertrand Grape, illustrated on the first page of this issue, is an accidental seedling found by Mr. J. B. Jones, of Herndon, Burke Co., Ga. A report of it will be found in the Trans. of the Am. Pom. Soc., session of '85, page 17. "Bunches medium; berries medium, round, blue-black; pulp dissolving, exceedingly juicy, vinous and of delicate aroma. Skin thin, quality best. Maturity middle of August. It belongs to the Cordifolia type, of which it is perhaps the best offering brought to notice. Vine exceedingly vigorous and healthy. Fruit has never decayed or dried up on the vine—a valuable variety."

Mr. P. J. Berckmans writes us that he saw the vine this Summer and was struck with its remarkably healthy appearance. He says the foliage denotes more of the Æstivalis than Cordifolia type, and that the bunches this year are much above medium.

THE farmers of Michigan will have small business to complain about politicians if they neglect to elect Cyrus G. Luce this Fall. If they had scoured the country they could hardly have selected one who more completely represents the farm and farmer. What do you propose to do about it, Michigan farmers? Now that you have forced one of the great parties to select as its standard bearer, a man from your own ranks, do you propose to elect him or not? For years there has been a cry that the farmer has been neglected in politics, that he has been a voter and nothing but a voter. We have listened long enough to the sneering answer that the farmer doesn't know enough to fill an office, that lawyers and professional men must take care of him. Michigan farmers have a chance to prove the falsity of this answer or to add to its strength, just as they wish. Let us see what they will do.

THERE is a lull in the conflict against oleomargarine. We have won the first round and now there seems to be a general desire to wait and see how badly the enemy has been hurt. It is idle to suppose that he has been exterminated. He has plenty of life yet, but if we have forced him out of the dark, and obliged him to fight in daylight under his own flag, we have made solid progress. One thing is certain. What the farmers of this country have done once they can do again with interest. If this law does not give farmers their rights, we will have one that will, if it is necessary to defeat every Congressman who depends upon an agricultural community for his election. The sooner Congressmen appreciate the fact the more worry they will be saved. But while we are waiting, friends, let us keep busy. Let us improve the herds, improve the methods, improve the feed and improve the butter. Good butter will always be sold, and the better the butter the better the price. Taxing oleomargarine will never make a market for poor butter.

THE BEST WHEAT.

MANY kinds of wheat have been and are still offered for sale this season with the promise that by sowing them farmers may "double their crops." Our advice is to try them in a small way. In this matter the RURAL begs to say that its advice *ought* to be entitled to some consideration, for we have tried during the past ten years nearly every kind that could be procured, and have, from time to time, placed before our readers the results of our trials; and now we see some of the poorest varieties so tried lauded in the highest terms by people that offer them for sale.

When with a great flourish a "new" wheat is offered that "was found" growing somewhere or other in a field or along a hedge, the chances are 19 against 20, if not 99 against 100, that it is an old kind —that is, one that is *some*where well-known. We have raised not less than 50 different lots of wheat sent to us as crosses between this, that and the other, that we have found identical with old varieties. In several cases a correspondence with the originator (?) has revealed the fact that he didn't know "beans" about crossing wheats.

We have told our readers a dozen times within a year what kinds of wheats do best at the Rural Farm. But the fact that they are the best kinds there is no *proof* that they will succeed in Maine, Indiana or Oregon. The *only* way for a farmer to find out what varieties of wheat will "double his crops," is to obtain trial quantities of the kinds that thrive best in other places and select the best.

SWEET DISEASE.

THE health officers of this city in their search for adulterations find a fruitful field for investigation in the common candies which are in universal use. Manufacturers have been detected in using several absolutely poisonous substances, while others in common use, if not directly injurious, are decidedly unwholesome. There ought to be a war waged against impure candy until the stuff is driven out of the market. We believe it to be a fruitful source of disease. There is something absolutely filthy in the way in which much of our ordinary candy is handled and sold. Every day in the cities hundreds of pounds of it are eaten after being handled over by dirty hands and subjected for hours to the dust and fumes of the street. We have seen, in country stores, candy lying for weeks in dirty jars or in a heap in some filthy counter close to ill-smelling products of all kinds. Such candy, made of damaged sugar and starch, and colored with some cheap poison, was bad enough when fresh, but after a few months of the ordinary treatment becomes too filthy to throw away. It is strange that intelligent men will take such stuff home to their children. If they wanted to ruin the teeth and the stomachs of their little ones, they could hardly make quicker work of it than by giving this cheap candy. Children demand sweets, but it is poor kindness to gratify them by feeding disease. Honey is the purest and most healthful sweet food, and where children can have it to spread upon their bread, like butter, there will be far less demand for cheap candy. We would gladly see the candy trade spoiled by an increased consumption of honey. The health of the children of the country would be greatly benefited could such a result be brought about.

THE new Premium-List of the R. N.-Y. is available to all who send yearly subscriptions at the regular price, viz., $2.00. It is a matter of choice whether they retain the cash commission of 50 cents for each subscription in clubs of five or over, or select any of the articles from the Premium-List, which are scaled so as to allow an equivalent of from one to two dollars for each subscription, according to the arrangement which we have been enabled to make with the manufacturers of those articles.

CONTAGIOUS PLEURO-PNEUMONIA IN CHICAGO.

SEVERAL months ago a commission agent at the Chicago stock yards bought a Jersey cow, now supposed to have come from one of the places where pleuro-pneumonia was prevalent among cattle last year, and turned her in with a herd of over 100 other cows on the outskirts of Chicago. After some months of illness she went dry and was butchered and a post-mortem examination showed that she was affected with contagious pleuro-pneumonia. This is supposed to be the origin of the disastrous outbreak that at present affects between 2,000 and 3,000 cows fed at three or four distilleries at Chicago. The matter first attracted the attention of Dr. Casewell, the State Veterinarian about a fortnight ago. During the past week all the distillery-fed cattle have been carefully examined and several of them have been slaughtered for post-mortem examination by Casewell and his assistants and Drs. Atkinson and Murray, State Veterinarians of Wisconsin and Michigan, Dr. Salmon, Chief of the National Bureau of Animal Industry, and a large number of other veterinarians having no official status, as well as by several physicians connected with the Board of Health, and all unanimously agree that there is no doubt whatever that the disease is contagious pleuro-pneumonia. It is of the utmost importance that not a shadow of doubt should rest on this point, and so far as veterinary skill in this country can be relied on, no shadow of doubt can rest on the matter. A number of animals that have died of the disease and a number of others that were picked out as affected and slaughtered, exhibited, in pleura and lungs, all the indications of the disease. Among all the veterinarians who examined them there is no doubt or hesitation on this point.

Governor Oglesby and Attorney-General Hunt and the members of the State Board of Live Stock Commissioners, after a thorough investigation on the ground, have decided to slaughter all the infected cattle, as well as all those that have been exposed to contagion, numbering "nearly 3,000 head," this morning's telegram says. The loss will be over $100,000. The State has $49,000 with which it can pay for healthy cattle killed as a precaution to prevent the spread of the disease after they have been exposed to it; but it has no funds to pay for affected animals that may be slaughtered for the same purpose. It pays for sound beasts at their market price for beef or the dairy. The National Bureau of Animal Industry has $100,000 to pay for infected cattle slaughtered by its direction, with the concurrence of the State authorities; but before the present outbreak it was proposed to expend most of this appropriation in an attempt to eradicate the plague from the States East of the Alleghanies. It is probable that only a small proportion of the animals to be killed are really diseased, and the question is still undecided how to dispose of the flesh of the slaughtered beasts. The Governor and other officials wish that, after a post-mortem examination, all diseased cattle should be cremated, and all healthy beasts sold to the highest bidder. By this means a part of the great expense to the State would be defrayed, while if the carcasses were taken to the rendering tanks, the returns to the State would be insignificant. On the other hand, the stock-yard people insist that millions of dollars would be lost to the packing interests of Chicago, if the report went out to the world that beef from the infected distilleries, whether healthy or not, was shipped from that city.

In a scare like that now prevailing in Chicago, there is always a strong inclination on the part of some to exaggerate the evil, and on the part of others to belittle it. There are rumors that some infected cattle and still more of those that have been exposed to contagion, have been sold to persons in various parts of Illinois and the adjoining States, where they are likely to spread the plague. It is known that the disease must have existed at the distilleries for six months or more. Early in its course an affected cow dries up, and it has always been the custom to send such beasts at once to the shambles, hence the existence of the plague remained so long undiscovered. The stock-yardmen are still loud in the assertion that not a case of genuine contagious pleuro-pneumonia exists in any part of the country. Their business is likely to be seriously injured owing to the present outbreak, and very naturally they minimize the danger. There are reports that other States will soon schedule Illinois, and in that case the Chicago stock-yard business would be very disastrously affected, for some time at any rate.

BREVITIES.

LOVE your home; love your family.

IF you don't, run away and stay away. "You never will be missed."

HOME is the dearest spot on earth to any man that isn't crazy, or wicked, or a fool, or a victim of an abominable condition of things for which he is in no way responsible. In any case, we repeat our advice—"Run away."

OF all the varieties of Spanish chestnut probably that known as *Marron de Lyon* is the best. Its nuts are very large—as large as a horsechestnut—and it bears in two or three years.

DR. R. P. GREENLEAF, of Delaware, sends us a black seedling grape that ripens with him two weeks before Concord. The quality is good, and if the vine should prove strong and healthy it will prove a fine acquisition.

MR. O. H. ALEXANDER, of Vermont, says that he, too, finds Yankee Prolific Oats the same as White Russian. He thinks that the Welcome or White Australian Oat is somewhat different from the Badger Queen.

THE reason why the lower or white portions of the stems of asparagus are less tender than the upper or green parts is that they are older. The stems grow from the *top*, not the bottom. As the shoots increase in age, the woody fiber increases.

TRY the Frederick Clapp Pear. The fruit is fine-grained, very juicy, rich and excellent. It ripens in October. Those who want a *showy* pear in place of the great Kieffer, as well as one that may be enjoyed, will be pleased with the F. C. It has not as yet been tried sufficiently to enable us to say where it will succeed.

WE can sell our small potatoes at $1.00 per barrel at the yeast factories. Many good Western farmers never pick up the small potatoes. There is no sale for them and farmers think their feeding value will hardly equal the trouble of picking and handling. At one dollar per barrel there is no profit in small potatoes, but we can turn our work into cash, which is a great item.

WE are sorry to learn (through a private letter) that a certain railroad is about to be run through the seedling vineyard of T. V. Munson, of Dennison, Texas, our first grape authority. This may occur, it seems, before he can transplant or propagate the vines. In any case it will require three years or more before they would again bear. Mr. Munson's grape experience has already cost him dearly.

THOUSANDS of dollars are thrown away every year by farmers and their families who haven't sufficient strength of mind to resist the solicitations of the fakirs at the fairs. It is hard to understand why an association of farmers will for a paltry sum sell privileges that will permit the swindling of their families or employés out of considerable sums of hard-earned money.

IN the way of improving tomatoes, what we want is a variety that will resist rot; that will keep longer than any kind now offered for sale. It must, however, be smooth and of goodly size. We have selected tomatoes for the past 10 years with the above object always in the foreground. Before the writer, on a table in his office, is a tomato that has been there three weeks without the appearance of rot. It is shriveling the same as a native persimmon.

THE raising of turnip and cabbage seed has proven very profitable, and added materially to the income of the farmers on the East end of Long Island. One farmer near Mattituck is said to have cleared $1,200 from cabbage seed alone. Another made $120 from turnip seed raised on a small plot. The main crops in that section are cauliflowers, cabbages, and potatoes, and the raising of seed has heretofore been subsidiary to these crops, but it has proven so profitable that many farmers have gone into it largely.

LAST year with a tremendous crop of melons we did not average much over one dollar per barrel. This year with about 60 per cent. of last year's crop the price averaged nearly $2.00. Tomatoes ran about the same. Beans were lower, but sweet corn was decidedly higher. Potatoes ran small and will be a little lower in consequence, while cabbage bids fair to be higher. So it goes, a big crop cuts down prices while a poor crop sends prices up. One thing seems plain that when one depends upon a city market it pays to grow a variety, and to shift the different crops about to different parts of the farm.

Indust'l Societies.

AMERICAN HORTICULTURAL SOCIETY AT CLEVELAND.

(RURAL SPECIAL REPORT CONTINUED.)

Sensibility of plants; fruit and flower display; officers elected; a "millionaire" horticulturist; high praise for wood ashes; drainage; why potash is good in a drought.

A PAPER on the sensibility of plants, by Charles A. Green, New York, was read by the author. He thought people often forget that vines or plants are real live beings, and said their sexual characteristics prove them distinct from the rocks in being endowed with sensibility. He alluded to the recent crosses between wheat and rye, the raspberry and blackberry by the RURAL NEW-YORKER, etc., the latter producing a pomological mule, as he said, and many similar illustrations were cited in support of this theory.

Though not large, there being less than 200 entries, the fruit and flower show was attractive. It included some fine apples, grapes and peaches, and a choice collection of rare plants and flowers, the latter being mostly from the greenhouses of Mrs. Ella Grant Campbell, the lady who started on a capital of 15 cents a few years ago, and has now attained a national reputation as a floral artist. Her parasol of carnations, tuberoses and sweet peas, shown in the hall, was a unique design, winning the first prize. The collection of Mississippi apples, shown by Dr. McKay, about 25 sorts, was remarkable for the size, color and beauty of the specimens. Several of his Roxbury Russets measured 12 inches around each. He got second premium for collection.

In pears, the display of Ford & Sons, Ohio, took most of the honors. For grapes, the special prize for collection went to L. Harris, of Euclid, with single plate prizes pretty widely distributed. Caywood & Son, New York, took first and second for best named seedling, respectively with Ulster and Poughkeepsie, a small display of which attracted much attention among the Western grape-growers. R. A. Hurd, of Euclid, took first prize for plums. W. N. Cook, Michigan, for peaches. Geo. W. Campbell had 10 of his recent grape seedlings on exhibition. Some 50 varieties of grapes were shown by the Eastern Cuyahoga Horticultural Society; and a three-year-old Worden vine, bearing 48 bunches, 16 pounds of fruit upon it, was shown by Cushman & Son, Euclid, Ohio.

Though not in the regular order of the proceedings here, it may be stated that Parker Earle was unanimously re-elected president of the Society, and W. H. Ragan Secretary. T. V. Munson, Texas, was chosen First Vice-President, J. C. Evans, Missouri, Treasurer, and a Vice-President from each State. S. D. Willard, of Geneva, for New York, and J. S. Collins for New Jersey. Mr. Earle, on resuming the chair, said: "I don't know whether to thank you or not, or whether you have acted with propriety or not. In one respect at least I am not the proper person for your presiding officer. A society without financial resources, and without national or State aid, should have a wealthy president, like President Wilder, of the American Pomological Society." President Smith, of the Wisconsin Horticultural Society, was surprised. He thought Mr. Earle was a millionaire, and a little later, when money was being raised by ten-dollar subscriptions for compensation to Secretary Ragan, and Mr. Earle took five shares, Mr. Smith was surprised anew, saying: "Our president is richer than he said he was."

The second morning session opened with the reading of an important paper on "How shall we Protect our Crops in Time of Drought?" by J. M. Smith, Green Bay, Wis. He said, "We were too apt to leave our own crops entirely in the hands of Providence without using the hands and brains He has given us to help ourselves. Thorough draining is necessary. My garden contains 40 acres, having a slight slope. It is laid off in beds, with alleys between for carrying off surplus water. Beneath the alley is a tile water course for taking off the water that soaks through the soil. We have now passed through one of the most terrible droughts ever known in Southern Wisconsin, with only two light showers in June. But my cabbage roots extend from 18 inches to two feet below the surface, and they are doing splendidly. Deep plowing, and thorough and frequent cultivation of the soil, are most important. In dry weather especially I keep stirring the soil very often. Loose, mellow soil at the surface acts as a mulch, and in case of light showers the effect is almost marvelous: every drop seems to go where it is most needed. I find wood ashes of great value, not only as a fertilizer, but as a protection from drought, and I apply it freely, using 30 to 40 loads per acre. It is a great thing to hold the moisture. In May, 1885, I planted two acres of strawberries on land which had been manured for years. This Spring I applied wood ashes and cultivated the ground several times, watering a portion at times, but plants thrived best when not watered. Never saw such hot weather as during picking season, mercury went to 95 degrees, and even to 102 degrees in the shade. But in spite of that, and the unusually low price of strawberries, I realized handsomely from my strawberry patch." Continuing, he said: "Potatoes treated with ashes held out better than when compost was used. I have now 80,000 cabbages growing to the surprise and delight of everybody: nearly half have had no rain; land has been heavily manured for years, and thoroughly cultivated. But in addition I applied 100 bushels of ashes per acre."

Mr. Ohmer wished to emphasize the importance of this subject, Said he "I saved four acres of blackberries by watering and cultivation, while my neighbors lost their entire crops. I got 562 bushels of berries which brought me nearly $3,000.

A lively discussion then ensued on the subject of drainage, Mr. Smith being plied with questions from all sides. He began to underdrain nearly 25 years ago, and thought his

THE CENTURY PLANT. Re-engraved from the London Garden. Fig. 377.
(See page 655.)

father laid the first tile drain ever made in the United States. His were three feet deep, costing about $15 per acre. Members were surprised at the low cost and wanted to contract with him at once. Mr. Harrison, Ohio, had drained about 70 acres last Spring at a cost of $45 per acre. Mr. Smith's soil was loose, and tile is very cheap there. Chas. A. Green thought J. J. Thomas was the originator of frequent cultivation for drought. Mr. Caywood said it was nobody's invention, but as old as the hills Mr. Ohmer quickly replied "that is probably so, but there are more who don't know about it than who do." Caywood: "I admit the fact." Mr. Green thought ashes of no use where the soil was supplied with potash. Mr. Smith said ashes should not be plowed under deeply. Prof. Claypole, of Akron, gave a definite reason for the good effects of ashes in a drought, which seemed to surprise and please nearly every member. He said, speaking as a chemist. "The carbonate of potash is a very powerful and attractive agent for moisture: as every chemist knows, it is almost impossible to keep it dry in bottles. Hence the effect alluded to." Mr. Smith used double the quantity of leached ashes with similar results. The drainage question was again discussed at length, being shut off with difficulty by the president. The only point of value elicited was that the smaller the tile, so that it carried off the water, the better it would keep clear, by reason of more perfect flowing. In closing their discussion President Earle said Mr. Smith was one of the most successful gardeners in the Northwest. He was a theorist but never promulgated his theories until found successful in practice.

H. H.

PERSONAL NOTES FROM THE AMERICAN HORTICULTURAL MEETING.

PARKER EARLE must have a constitution of iron to endure the strain put upon him at this meeting. He presides with dignity and grace. His address was considered worthy of the man and place. It will be published in full by the American Horticulturist, Detroit, Michigan, and widely distributed on the recommendation of a committee voted to do that work.

L. B. Pierce was the leading spirit at the exhibition hall. The Ohio State Society gave $100 for premiums, and $300 were raised by local subscription. The exhibition was an attractive one, especially in grapes, apples and flowers. A floral parasol and a floral fish placed upon the reporters' table, attracted much attention. The parasol was lined with red flowers and covered with white flowers outside, nicely fringed, resting upon a base of ferns. A large stage was covered with greenhouse plants in blossom. All this from the local florists.

Matthew Crawford, of Cuyahoga Falls, Ohio, is about 43, tall and serious, excessively modest and retiring. His opinions are sought, and he is an able writer and careful cultivator. Charles Carpenter, of Kelley's Island, planted the first vines in his vicinity. He is well advanced in years and his tall form is bent, but his eyes are as bright and his face as well lit up as ever. George W. Campbell, who originated the Delaware Grape—honor enough for one man—appears as sprightly as he did twenty years ago. He has seen many changes in grape growing in his day, and is always prominent when grapes are discussed. Frank H. Leavenworth, of Detroit, Michigan, represented the American Horticulturist, Editor Myrick the Farm and Home, Mr. Hendricks the Daily Tribune and RURAL NEW-YORKER. Dr. H. E. McKay, and Professor A. B. McKay, of Mississippi, Ivan Lindley and George E. Boggs, of North Carolina, gave us some new ideas of horticulture in the South. Mississippi grows strawberries by the 100 acre patch, by methods not practised North. Her Agricultural College is a progressive institution. The high lands of North Carolina are destined to become famous for fruit growing W. H. Ragan, the indefatigable secretary, is a persistent and successful worker. President Earle could not secure a more efficient lieutenant. He is well informed and his heart is enlisted in the work. Mr. Vaudeman, of Kansas, is the newly appointed manager of the Pomological Bureau recently established by act of Congress. He is about 40, and served an apprenticeship under Dr. Warder.

President Earle stated that in 1853 Ohio had half of its surface covered with forest. In 1884 but 17 per cent. of the area remained in timber. Now only one-sixth of the surface is covered. Thus climate changes. Cold Winters are followed by hot Summers, and drought by disastrous floods. President Earle traced the growth of horticulture in Ohio from the early days when Johny Apple Seed, an interesting figure in history, preached the gospel of Christ and scattered apple seeds, which germinated and produced trees which bear fruit to this day.

John M. Smith, of Wisconsin, thinks the first thing necessary is thorough tile draining for gardening. No artificial watering is so good as rain from the clouds. If you water at all do it thoroughly, for half-way work does more harm than good. Mr. Harrison had put in 70 acres of tile this season, at an expense of $45 per acre, 3½ feet deep, two rods apart, using 80 rods of tile per acre. Professor McKey said that drains in Mississippi did as much service by promoting moisture in dry spells, as by carrying off surplus water in wet seasons. Mr. Cushman's management of the excursion to Euclid was a success. After visiting 3,000 acres of vineyard, we returned to Euclid, where we were welcomed by music from the Euclid band. Long tables were spread upon the lawn. After dinner, speeches were made by a number in response to sentiments proposed by the President.

Does this society conflict with other societies? No. There is work and room for all. There should be no attempt to subordinate one society, and no feeling of rivalry, except that each should endeavor to do all the good work possible. The more societies the better, so long as they can be equipped and sustained.

Rochester, N. Y. CHARLES A. GREEN.

We are sending specimens of the R. N.-Y. to some of our old subscribers who are not subscribers now. We respectfully call their attention to our proposition to send the Rural from now until the end of next year for $2 00, or in Clubs of Five or over for $1.50. We invite them to send for our new 16-page Premium List, which, it will be conceded, offers very liberal compensation to all who are willing to aid in extending the Rural's circulation.

SOCIETY NOTES.

THE Bay State Fair, which is to be held in Boston October 5–8, promises to be a great success. Maj. H. E. Alvord has been placed at the head of the dairy department. It is intended to make this department one of the strongest features of the exhibition. The society offers prizes amounting to $275 for butter and $100 for cheese. The New England Farmer offers $100 more for butter made on private farm dairies, and free subscriptions to all exhibitors whose butter scales over 80 points. The Boston Herald offers $100 to be given in prizes for the best displays of utensils and appliances connected with the milk supply of cities and towns. This latter exhibit will be something unique All articles are to be admitted which are useful in connection with the milk service anywhere between the cow and the consumer. Maj. Alvord has prepared a circular stating the facts connected with the exhibition, which all who are interested should secure. His address is Amherst, Mass

The second annual exhibition of the Essex Co. Agricultural Fair will be held at the Skating Rink, Montclair, N. J., Sept. 29 to Oct. 1. Those who desire to witness a farm exhibition pure and simple are notified that they will find it at Montclair. One excellent plan adopted by this society is that of offering for prizes a year's subscription to various farm papers. Nursery stock, bags of fertilizer, shoes, robes and other useful articles take the place of money prizes in many classes. We are sorry to see a box of cigars offered as a premium for the best collection of apples. Suppose a lady should show the best collection? Some man will at once feel himself bound to smoke himself into the condition of a ham in order to do justice to the victory. A goodly part of the display will be given up to

the Home Department. Prizes are offered for best bread, cake, preserves and pies. A choice Hybrid Perpetual rose bush is offered as a prize for the best cherry pie. Success to such a fair, say we.

THE conduct of the Tri-State Fair, at Toledo, Ohio, was an insult to honest farmers. Liquor was sold openly and the most abandoned characters flaunted themselves before the public. While the display of implements and stock was fine, the moral tone of the exhibition was too low for a beer garden. Boycott this fair, farmers, until the managers come to their senses.

MORE papers than ever are condemning the horse racing features at the fairs this year. Too much of this talk never rises above a grumble. The reasoning of the managers is that for some unknown reason a fast horse and the opportunity to bet upon its speed will draw the crowd as nothing else will. As the racing brings in the most money and helps most to pay the bills, it is no more than right that most of the premium money should be paid them. This sort of reasoning does well enough for those who think the sole object of a fair association is to make money. Some people have a little higher ideal than that however. We say that if a fair cannot be run without horse racing, fat women and immoral shows it had better not be run at all.

IT was noted at the Elmira Farmers' Club that almost every farmer had cattle to sell. The short fodder crops make cattle food scarce. Even the farmers who depend mostly on grain are not particularly anxious to buy cattle.

HERE are some specimen swindles: William Waite Warner was arrested by United States officers at Jackson Mich., the other day, on complaint of Post Office Inspector Purcell on a charge of using the mails for fraudulent purposes. Warner claimed to publish a daily and weekly paper and to circulate from 35,000 to 60,000 copies. He would write to business men requesting goods in exchange for advertising, receive the goods, print advertisements in a few papers, and send a copy to the advertiser. He had a little printing office, and is said to have been carrying on the business for 10 or 15 years, and to have secured a large amount of goods of all kinds, including quite an extensive library. The existence of such a paper with such a circulation was unknown to the people of Jackson. Every subscription season, however, he managed to secure a number of subscribers, who were, of course, always swindled out of their money.

Here is a variation on a trick several other forms of which have been more than once exposed here. We find it in the Farmers' Review:

"I want to sell you a county right for a self-acting wagon brake." The farmer said, "No, I am not in the canvassing business and don't want to be." "Well, replied the agent, "I have sold every county in the State but this, none for less than $500, but as I am ready to begin operations in Michigan, I will take $100 for this county." The farmer still declined, and the agent did not urge him, but remarked, "I am sure if you knew the value of what I offer you that you would take it, and I believe now that when you think the matter over you will change your mind. At any rate, here is my address, and if at any time within a few weeks you want the county right send me your note for $100, due in ninety days, and I will forward it."

Off he drove, and of course, a few days later a stranger called and said, "I understand you own the right for this county for the patent wagon brake, and I would like to buy it." "What will you give?" said the farmer, as the thought came into his mind that there was a chance for a speculation. "Three hundred dollars," said the stranger. "I can't sell it for that, the price is $500," answered the farmer. "I will split the difference," said the man. "No, I don't care about selling it unless I get the $500." "Well, I will take it, and here is $5 to bind the bargain," and he called the attention of the farmer's hired man to the transaction as a witness to the bargain, and asked for the papers and the model. The farmer said he never kept valuable papers about the house; but he would have them in a day or so, and the stranger agreed to call for them on the second day thereafter, saying, "You must not disappoint me though, for I have three good canvassers engaged and we can work the county in a short time and I expect to make $1,000 clear money out of it." The stranger left. The farmer posted a letter with his note for $100 by the first mail. He never saw either man again, but he got his note back by paying 100 cents on the dollar for it and he feels that he paid a high tuition fee for a little knowledge.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

A SPLENDID WOMAN.

No Greek, no French, and but one verb of Latin;
Of higher mathematics none to boast:
With far more love for simple lawn than satin,
For unadorned she seems to shine the most.
A novice in high art, its lore disdaining,
And never guilty of a Sapphic verse;
Of Terpsichore slight knowledge still retaining,
Sad losses these, and yet it might be worse.

Modest, and brave where moral strength is needed;
Easy and graceful, gentle and refined;
In culinary art high rank conceded,
In hospitality to trouble blind.
Unostentatious in her mild demeanor,
Courteous and animated, full of life;
Perchance you may or may not yet have seen her;
Perhaps you envy him who calls her wife.

The goddess Fashion she may reverence slightly,
Yet, like her sex, have due regard for dress—
A thing no woman can pass over lightly
Without vexation and some mild distress,
And yet no slave to habits so alarming,
Content with what Dame Fortune may bestow;
Her smile is bright, her conversation charming,
Sprightly, but artless, are the words that flow.

Her "set" is not so utterly exclusive
That worth, though humble, may not mingle there,
Nor lowly sorrow deemed by her intrusive,
Nor suffering want denied its pleading prayer.
If Fate is kind, with grateful smile she greets him,
And shares her pleasure and her fortune, too:
If Fate is cruel, still half way she meets him
Nor points with envy at the favored few.

Her path, when smooth and strewn with fragrant beauty,
Draws out her love for it and Nature's God;
When furrowed with the rugged lines of duty
She bends, but never faints beneath the rod.
To ceramics no idle hours are given,
Nor days allotted to *ennui* and sloth;
Flirtation and frivolity have striven
With her in vain, for she has conquered both.

The fair and idle dreamers daily pass us
With languid air, *recherche* as to dress,
They drink in tales, or linger near Parnassus
With finest frenzy and a keen distress;
Our heroine finds ample scope for science
In bridging o'er life's griefs as they occur,
Domestic arts, with each approved appliance,
Are more than dreams, and never Greek to her.

One verb of Latin, and the tense is present—
A tyro's knowledge, but a woman's bliss—
Amo and *amor*, sweet, euphonious, pleasant,
Attain their acme with the added kiss.
In every tongue this mood is only human,
Which indicates the highest joy we reach;
Who can conceive, then, of a splendid woman
Who has not learned what Heaven and Nature teach?

—*E. A. Boyden, in New York Star.*

OF INTEREST TO WOMEN.

THE Indian girls being educated at the Lincoln Institute, at Wayne, Pa., recently entertained guests at a "wolivicayapi," which, literally translated from the original Sioux, means a feast. Refreshments were served in gaily painted wigwams, and the red-skinned maidens made their guests happy in a way that would have been creditable in any experienced hostess.

THE annual report of the Christian Women's Exchange in New Orleans gives as the total amount of money paid to women during the year the sum of $11,974.25.

APPLIQUE GALLOON is a new and handsome trimming. It comes in all colors, combinations and designs, and looks more like hand embroidery than machine work.

AMONG new autumn fabrics is Khayyam broadcloth, a sort of camel's hair. It is expected that smooth-surfaced goods will lead next Winter.

THE Philadelphia Home Journal asks if it would not be well to change the moral of many of the tales of the present day. Inferentially the moral drawn is: "young woman practice the cardinal virtues or perhaps you will not catch a young man" In these days of "two-for-a-quarter-and-a-prize-thrown-in," and "a-chromo-with-every-pound-of-tea," we suppose it is necessary to offer *some* inducement for the practice of those virtues which are supposed to make a woman lovable and sought after as a companion either in the home or for life, but could not some other premium be offered? A pleasanter home, for instance, an easy conscience, a parent's approval, or some little thing like that?

HEADS AND HEARTS.

"Now, when I was a boy,
Woman, without alloy,
Was modest, mild and shrinking,
And never thought of thinking,
But had it all done for her,
By her supreme adorer,"

sings the bard of a popular comic opera. His somewhat halting verse contains amid its chaff a few grains of substantial truth. Aforetime it was the prevailing impression—it is still with some—that any effort of independent intellect on the part of a woman interfered with her purely feminine characteristics. We were told that a woman might be a good housekeeper, but she had no business faculty; a fallacy on the face of it, for to be really a good housekeeper entails the possession of great executive and administrative ability. It is both sense and sensibility, warm sympathies with a solid bed-rock of common sense, that make the house mother a perfect success. We have heard more than one man say he would never deliberately choose a woman of brains for his wife, because her very intellect would make her undesirable. But these conservatives were confounding, mere negative intellectuality with positive intellect. It is but natural that a woman with ability, well trained, should excel an undisciplined housekeeper. Only unfortunately every one does not take this view. Housekeeping with brains means much; it means order, "Heaven's first law;" it means cleanliness, refinement in everyday matters, cheerfulness, and serenity. But we often speak of a woman as possessing culture and a thorough education, when she is merely trained in one direction, and that not the right one. Since the homes of a nation are to be our own undivided charge they must hold first place in our minds, whatever intellectual hights we may scale. Nor is it a light charge. Let the men pride themselves if they will, on their triumphs over nature—on the wildernesses they subdue, or the oceans they fathom. But the woman's task is a greater one if she but devote to the highest good every talent she possesses. It is her work to mould the intellect of coming ages; she must cultivate the germ of the future men, subduing and suppressing the evil—drawing out the good.

Does it not seem laughable, were it not sad, denying that any man should for a moment imagine intellect unnecessary in a wife or mother? The old-fashioned woman was supposed to be all heart, the modern bids fair to be all head. The first was rather apt to produce sensibility *sans* sense—the second would be an intellectual Medusa if her woman's nature did not crop out at unexpected angles. The ideal woman, the heir of the ages, must be a combination of both, with a warm heart and large sympathies, controlled by a clear head and trained intellect—and to her we must look for our social millenium.

ORGANIZED EFFORT.

PERHAPS it may interest the readers of these columns to learn about a society now existing in a country neighborhood. It is called "Five Corners Band of Cheerful Workers." Our motto is "Work is Worship." This society was formed a few years ago, and is composed mostly of young people, the membership now exceeds 100. It meets semi-monthly, with different members of the Band. During each session a literary programme is given, also music. Until of late debates were a part of the evening's programme, which proved to be both instructive and beneficial. At first the proceeds were devoted to charitable purposes, amounting to a considerable sum. But lately we resolved to use some of the money for our own special benefit.

A library was soon started, and now we have quite an assortment from among different writers; occasionally a book or two is added, giving the reader a larger collection to select from. But yet, when there is need of our "mite" we give it gladly. For instance, recently we learned that a poor man in our neighborhood had become blind, and we sought to help him. It was decided to give a basket sociable, charging for each basket, and having also for sale peanuts and water-melons. The woods was the place selected for this sociable, which passed off very pleasantly to all, resulting in a nice little sum for the desired purpose. Among our group lunching together was a minister, and during our conversation our library was alluded to, also the *kind* of book to read. I asked about the reading of novels. He remarked that morally he would not advise them to be read. Although most novels speak out of human nature, yet if we had a bird's-eye view of the whole world, so we could see it at once, we would see greater things than we learn in reading novels. "And yet," he continued, "I think that one-tenth (or perhaps a less per centage than that) of the novels written would be of benefit to us." A love of reading often commences at home. One might say as quickly as a child learns to read, it begins to be interested in books. Usually the school book is its first companion in the line of reading matter; and then comes an occasional "present" of some book.

I have noticed that parents' tastes vary greatly in the selection of books, and if they would have their children profit by the reading of good books, they should exercise the best judgment in securing for them literature of the most merit, and that when read will leave their minds full of the true and noble. I would say, in conclusion, that if more such societies as the above should be formed in the different localities it would be a great benefit to the community at large.

MARY D. THOMAS.

PITHY PARAGRAPHS.

CHANGE is rest. Come from your homes, your shops and your stores where you are breaking down with care and toil. Get out of the ruts you are wearing so deep, and in new work for the Master, gain strength for your daily labor.

THERE will be some blessed surprises in the great day. This is hinted in Matthew, 25. The sweet thoughts of pure souls that just budded in time will exhale aroma like roses. High aims will shine out like good deeds. Little words of love dropped here and there and long forgotten will be repeated in music sweet as the song of angels. Kind deeds for Jesus' sake will be found embalmed in the dear Lord's heart.

A TEAR of sympathy may be more precious than words. It cannot deceive. There is no shame in the tear that shows a man has a heart.

ZEA MAYS.

LOST TIME.

THE early fading of married women is always a subject for comment among their dearest friends. And each particular friend has some very good cause to assign for it. But it is a question whether, in many cases, it is not greatly the woman's own fault.

Think, mothers, do you not do much unnecessary work? I am not going into an elaborate discussion of the sewing question. Everybody knows that you all, or at least nine-tenths of you, sew much more than there is any necessity for. I am going to speak only of the *sitting* question. Now think carefully. Do you not *stand* to do many things about which you could as well *sit* if you were only accustomed to it. "O, but it looks so lazy!" A fig for the way "it looks!" Why should a woman stand up to pare potatoes? I've seen women stand half the morning preparing vegetables. Ask them about it and what is their answer. "O I don't know. I always stand. I'm used to it. I can work better so." They have no business to *be* used to it. With all that a mother or housekeeper *must* do, she has no moral right to strain her physical or nervous system by doing one thing that she is not obliged to do. Accustom yourself to sitting as much as possible while at work. Have a high chair with a rest for the feet made to fit your table and sink. It will not cost much, but it will save you many a back-ache, many a doctor's bill, many a sensen of regret over a cross word you have spoken under the strain of having "been on your feet all day." Plenty of women work in such a back-handed way that one wonders they can live.

"I *never* lie down in the daytime," says some one decidedly and so self-righteously that the poor little meek woman who has ventured the remark feels quite criminal in ever having indulged in such a disposition.

It is not only right, says the Ladies' Home Journal, but a woman's bounden duty to take all the rest she can get. If a mother can possibly find time to throw herself down on the sofa for a few moments she should do so. It is a necessity and one that cannot with impunity be put aside. If baby is awake and you are afraid to leave him alone, put him and his playthings in a dry goods box, give him a quart of Indian meal and some little tin plates, or some other novel amusement, reserved for just such emergencies, then seize five minutes, or even fifteen minutes' rest, and you will go at your work again with a renewed vigor that will enable you to much more than make up for lost (?) time.

GOLDEN GRAINS.

THERE are some people who never have a cheering word for the struggler. They make life just as hard as possible for all who are striving to do right..... ....

HE who will not look before him will have to look behind him, and probably with some regret..... .....

TOO many believe that "the world owes every man a living," and that it requires no personal effort to make the collection. ....

MARION HARLAND says: "Domestic life has peculiar trials, but so has every other condition of this our mortal probation. They who wear thin shoes and step gingerly, feel the pebbles in the path. The firm tread of the stout boot presses them into the earth".....

FIELDING says: "Without adversity a man hardly knows whether he is honest or not."...

MRS. BEECHER says: "Home is the true kingdom of woman, where her rights can never be dethroned. Here all pure love, all right thoughts, all religions, all governments if we would have them live and flourish, must have their roots beneath the altar. This conviction impels me to say to every woman who has a home, 'Let home stand first before all other things'"..... .....

YET to the faithful there is no such thing
As disappointment; failures only bring

A gentle pang, as peacefully they say,
His purpose stands, though mine has passed away...

PATIENCE and strength are what we have now; and all the time an earnest discontent until we come to what we ought to be ....

THE saying is credited to Plutarch that five great enemies to peace inhabit with us, namely, avarice, ambition, envy, anger, pride. If these enemies were to be banished we should infallibly enjoy perpetual peace..... ....

THE secret of good manners is to forget one's-self altogether. The people of really fine breeding are the ones who never think of themselves, but only of the pleasure they can give to others. No adornment of beauty, of learning or accomplishment goes so far in its power to attract as the gift of sympathy.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

A HANDY WOOD-BOX.

A WINDOW recess that I wanted to use for a stand for plants seemed to be the only convenient place in the room for the wood-box.

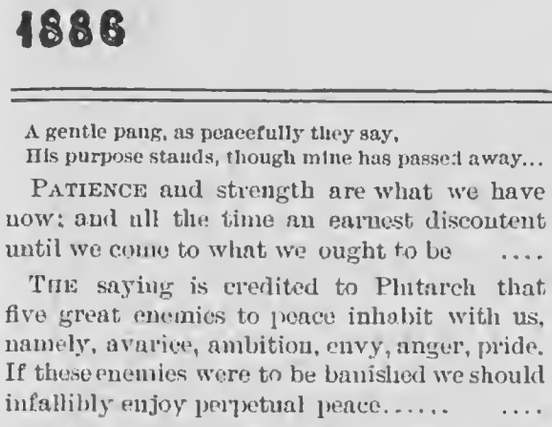

Fig. 378.

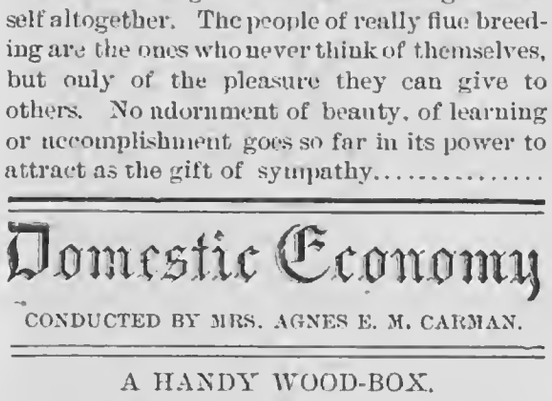

Fig. 379.

The above illustrations show how I combined the two. The box is four feet long, three high and 20 inches wide. I used turkey-red for covering, tacking a flounce around the top. ONE OF THE AUNTS.

KITCHEN TALKS.

ANNIE L. JACK.

THE corn meal kept in a wooden building adjoining the house had a habit of turning sour from heat till the Scientist of the family put a large, smooth limestone in the middle of the barrel, and it has kept it safe through the hot weather. He advised the young ladies who wear tortoise-shell combs to rub them with sweet oil, to keep the teeth from breaking.

The Amateur Cook cut a leg of mutton the other day that had been cured in the same way as a ham. Six pounds of salt, eight ounces of saltpeter and five pints of molasses will make enough pickle for one hundred weight. The legs should be kept in the pickle three or four weeks, according to size, and then hung up for a day or two to dry before they are smoked. Where people keep sheep and prefer mutton, this recipe is worth keeping to try in cool weather, for another season. If slightly boiled and fried in a flour batter, meat prepared in this way comes in useful when fresh meat cannot be had, and it is the most tantalizing thing in life to have extra people come in at dinner time when you have just enough and no more, and no butcher is within hailing distance. Then, instead of a pudding, there is nothing better than a tablespoonful of wine of rennet mixed in a quart of warm milk; flavor with vanilla, or any other favorite, set awhile on ice and eaten with sweetened cream. Our family are very fond of rice, and it is a cooling and healthy diet in Summer. When we use it simply boiled one day, I take out a dishful, mix it with a good custard and a few currants, bake, and serve cold the next day. We tire of rice baked in the oven with milk, though in cold weather it is quite a relish. It is a good thing in cooking to make two days' dinners as nearly as possible at the one time. Then the next day's time can be spent in many profitable ways away from the kitchen. In Summer especially this is necessary and labor-saving.

The autumn flowers are brilliant and beautiful—they please the eyes, but do not touch the heart, and I find myself singing the old refrain:

"Return darling lilies and white roses
And bring back the Summer days again."

FRENCH LACE.

THE directions for this pretty lace were taken originally from the Household. It is very different from any pattern that I ever made before. Cast on 13 stitches, knit across plain.

First row, k 3, o, n, k 2, o, n, k 4.

Second row, k 2 over four times, k 2, o, n, k 2, o, n, k 3.

Third row, k 5, o, n, k 2, o, n, k 1, p 1, k 1, p 1, k 2.

Fourth row, k 8, o, n, k 2, o, n, k 3.

Fifth row, k 5, o, n, k 2, o, n, k 6.

Sixth row, k 10, o, n, k 2, o, n, k 1.

Seventh row, k 3, o, n, k 2, o, n, k 8.

Eighth row, Bind off four stitches, k 12.

Explanation of terms: k signifies knit plain; o, put thread over needle; n, narrow or knit two stitches together; p, means purl or seam stitch. AUNT EM.

WASH BENCH.

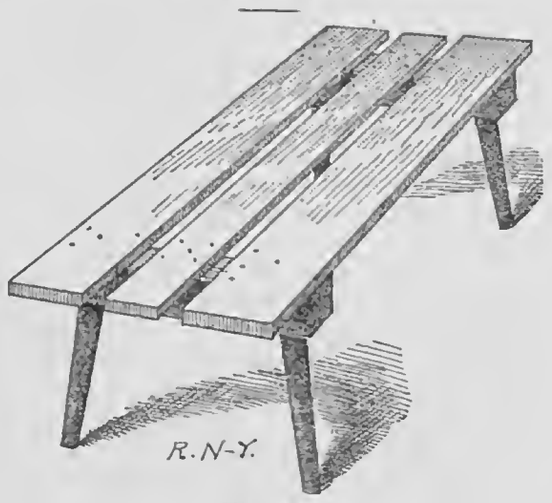

Fig. 380.

THE above is a drawing of a wash bench the writer made when a lad of fourteen. It has been in constant use eighteen years without repair.

The outside boards for top are plump one inch thick, six inches wide. Middle four and a half inches wide and a little thinner. White wood (poplar) was used. Pine is as good or better. The boards are fastened to three and and a half inch square oak sticks, 20 inches long, with No. 8 clinch (wrought) nails. Holes were first bored through the boards so as not to split them when driving the nails.

Holes one-and-one-half inch in diameter were bored in square sticks for the legs, before the boards were fastened on, to avoid boring for nails. The bench is 18 inches high and four-and-one-half feet long.

Boys don't let your mothers or sisters use chairs or that old warped plank of a bench to put the tubs on any longer. Go at it and make one that the tub will set level on and never slip. When done give it a coat of paint. D. S. H.

A PROTEST.

THE RURAL has been in our home for over 16 years, and we think it is just the best paper of its kind published. There is something in it to interest each member of the family, and many are the toothsome dishes that have come to our table from having read "Domestic Economy." But there is just one thing I feel I must say in regard to the wine and brandy, that are in some of our recipes I think the time has gone by when such things are needed to give our delicacies the desired flavor. Why not let our influence be on the side of temperance in our part of so good a paper, and reject all such recipes "lest we make our brother to offend?" MRS E. W. L.

DOMESTIC RECIPES.

COCONUT CAKE.

FIVE eggs, three cups of sugar, one cup of butter, one cup of milk, one teaspoonful of soda, two of cream-of-tartar, four cups of flour, bake like jelly cake. Icing: One-half pound of white sugar to the beaten whites of two eggs, add the cocoanut and place between the layers.

The above will answer for chocolate cake, with the following icing: one cup of sugar, one cake of chocolate and whites of two eggs whipped together.

ONE EGG LAYER CAKE.

One egg, one cup of sugar, one tablespoonful of butter, half a cup of sweet milk, half a teaspoonful of soda, one teaspoonful of cream-of-tartar. A little more than one cup flour. This makes two layers. CANADIAN.

OYSTER FRITTERS.

Drain the liquor from the oysters, to a cup of this liquor add a cup of milk, three beaten eggs, a little salt, and flour enough to make a thin batter. Chop the oysters, and add to the batter. Have ready in a frying-pan a mixture of beef-drippings and butter; heat very hot, and drop the oyster-batter in by the spoonful. Skim out as soon as they are delicately browned, and send to table at once.

OYSTER OMELET.

Beat six eggs, whites and yelks separately; to the yelks add a half cup of thin cream or rich milk, a little salt, and 24 small oysters chopped fine. Put two spoonfuls of butter into a frying pan, and heat while mixing the omelet. Add the whipped whites to the other ingredients, mix lightly, and when the butter is hot turn into the pan. Shake to prevent burning. When "set" in the middle, turn one-half over the other, and turn onto a hot platter. MRS. P. BELL.

BATTER PUDDING.

A pint of sweet milk, four eggs, whites and yelks beaten separately, two even teacups of sifted flour, a little salt, and a pinch of soda. Bake in a buttered dish three-quarters of an hour. Serve at once with a rich sauce.

KATE E.

CAKE FRITTERS.

Here is a good way to use up stale cake. Cut dry cup or sponge cake into rounds or diamonds with a cake cutter. Fry these pieces in hot fat, the same as you would fritters. Dip, very quickly, half of the pieces into a dish of boiling milk. Spread these pieces thickly with jelly, jam or preserves, cover with the dry pieces, put a little of the jam or jelly on top and serve. MRS. ECONOMY.

QUINCE CHEESE.

You can use small, imperfect fruit for this preserve. Pare, core and slice the quinces and cover with cold water. Stew the skins, cores and seeds with just enough water to cover until tender, then strain through a thick cloth, pressing out all of the juice. Drain off the water from the quinces, put into a preserving dish, add the liquor strained from the parings and cook slowly, stirring and mashing the fruit with a wooden spoon. To each quart of this mass, add a pint of sugar. Cook until very thick. Put into jelly tumblers. It should be thick enough to turn out firm so that it can be cut into slices.

SWEET-TOMATO PICKLE.

Seven pounds of ripe tomatoes peeled and sliced, three pounds and a half of white sugar, one ounce each of powdered cinnamon and cloves, and a quart of good vinegar. Mix and cook one and a half hour. Bottle and seal. MRS. I. S.

BIRD'S NEST PUDDING.

PARE and remove cores of eight quick-cooking tart-apples, put into a pudding-dish so that they will fill the bottom, make a custard of a quart of milk, yelks of six and whites of two eggs sweetened and flavored to taste. Pour over the apples and bake slowly until apples are tender and custard "set." Make a meringue of the whites and four spoonfuls of powdered sugar, spread over the top and return to the oven until delicately browned.

LEMON MERINGUE PUDDING.

Soak two cups of fine bread crumbs in a quart of milk. Beat a half cup of butter and a cup of sugar to a cream, add the yelks of four eggs, beat again then stir into the bread and milk. Add the grated rind of a lemon and bake in a buttered dish until firm and lightly browned. Whip the whites stiff, add three spoonfuls of powdered sugar. The juice of half a lemon, spread over the pudding when done and return to the over to brown. Eaten cold. MRS. C.

"POT-ROASTING" is an economical and not-to-be-despised method of cooking meat.

APPLE-SAUCE that is passed through a colander is voted "best" at our house.

As a rule lima beans are not cooked long enough. The best that we have eaten this season our hostess told us had been cooked slowly for four hours.

HERE is an excellent recipe for good rice pudding: One quart of milk, two tablespoonfuls of rice, two of granulated sugar; mix and stir often during the baking. A pudding of any size can be made by increasing the quantities, but the exact ratio should be preserved. Add a little salt if liked.

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure pin ubago, giving off no poisonous vapors. Fair size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your grocer for Dixon's big cake.

Pain in the Side

Is a symptom of disease. It may be caused by Rheumatism, or by Neuralgia, but it usually indicates a disordered condition of the Stomach, Liver, or Kidneys. Ayer's Sarsaparilla corrects the action of the vital organs, and removes every trace of disease from the system.

Last fall and winter I suffered from a dull, heavy, pain in my side. I did not notice it much, at first, but it gradually grew worse until it became almost unbearable. During the latter part of this time, disorders of the Stomach and Liver increased my troubles. I began taking Ayer's Sarsaparilla, and, after faithfully continuing the use of this medicine for some months, the pain disappeared and I was completely cured.—Mrs. Augusta A. Forbush, Haverhill, Mass.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

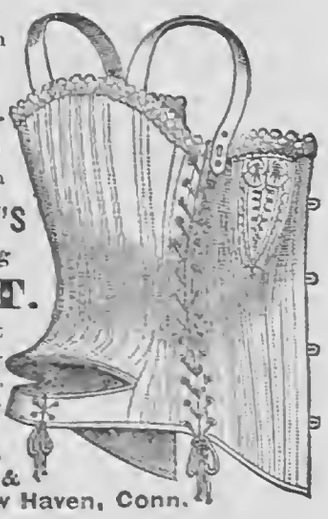
MAKE HENS LAY

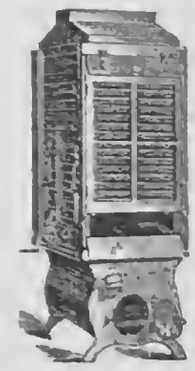
SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. L. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

FRIENDS, IF YOU ARE IN ANY WAY INTERESTED IN
BEES OR HONEY,
We will with pleasure send you a sample copy of the Semi-Monthly Gleanings in Bee-Culture, with a descriptive price-list of the latest improvements in Hives, Honey Extractors, Comb Foundation, Section Honey Boxes, all books and journals, and everything pertaining to Bee Culture. NOTHING PATENTED. Simply send your address, WRITTEN PLAINLY, to A. I. ROOT, MEDINA, OHIO.

GOLD MEDAL, PARIS, 1878.
BAKER'S
Breakfast Cocoa.
Warranted *absolutely pure Cocoa*, from which the excess of Oil has been removed. It has *three times the strength* of Cocoa mixed with Starch, Arrowroot or Sugar, and is therefore far more economical, *costing less than one cent a cup*. It is delicious, nourishing, strengthening, easily digested, and admirably adapted for invalids as well as for persons in health.
Sold by Grocers everywhere.
W. BAKER & CO., Dorchester, Mass.

ELEGANT SHAPE, HEALTH and COMFORT
Perfectly Combined in
MADAME FOY'S
Skirt Supporting
CORSET.
It is one of the most popular and satisfactory in the market. For sale by all leading dealers.
Price by mail $1.50.
FOY, HARMON & CHADWICK, New Haven, Conn.





THE PNEUMATIC
FRUIT DRIERS.
Made in ALL SIZES for farm or family use.
At the test of the leading fruit evaporators, at the Penn. State Agricultural Society at Phila., Oct., 1885, the "PNEUMATIC" dried a barrel of pippins in 50 minutes less time than the AMERICAN. The ZIMMERMAN was distanced, and withdrew before finishing.

News of the Week.

HOME NEWS.

SATURDAY, September 25, 1886.

EARTHQUAKE shocks still frequent at Charleston and in the surrounding country—three since Saturday. Relief Committee report 750 applications for repairs to houses, costing from $10 to $5,000. Reparation by committee soon to begin. Soup kitchens largely patronized. Food liberally distributed. Much uneasmess on account of Wiggins's prophecy of "the most terrible earthquake ever felt on this continent" and a tidal wave, on September 29, especially disastrous in the South. Much more help needed. Relief fund now $413,261.....President Cleveland, wife, mother-in-law, etc., returned to Washington Wednesday night, at 9 o'clock, after their very pleasant holiday fishing, deer-hunting, etc., in the Adirondacks..... According to Pension Commissioner Black, on June 20 there were 365,783 pensioners on the rolls—265,854 army invalids; 80,162 army widows, miner children and dependent relatives; 2,956 navy invalids; 1,878 navy widows, etc.; 1,539 survivors of the war of 1812, and 13,397 widows of that war. During the year 40,857 new pensioners were added; 2,229 were restored to the roll; 22,098 names were dropped on account of death, remarriage of widows, frauds, etc., leaving a net increase of 20,685 names. Annual average of each pension $122,23, a gain of $11.88 over last year—aggregate value $44,708,027.44, an increase of $6,617,041.51. Pensions paid during the year, $63,797,831.61. There are 8,095 pensions on account of amputations; 119,236 for wounds not producing amputations; 46,865 for injuries, and 163,728 for diseases. In poor-houses about 9,000 soldiers, of whom 13 per cent. are pensioners; 86 per cent. non-pensioners. The oldest soldier receiving public support is 103 years of age; the mean age is 57 years; 48 per cent. of all native born; 51 per cent. foreign born; 45 per cent. married men; 54 per cent. unmarried; 19 per cent. blind or insane. Pensioners are found in all but 118 of the 2,647 counties in the Union, and in 35 foreign countries....The Bell Telephone suit is dragging slowly along at Cincinnati. Local companies pay the Bell comany 50 cents a month royalty on 350,000 instruments; yearly income therefor $2,000,000. Patents in contest have six and seven years to run yet.....The sleeping-car porters have organized "for mutual aid and protection".....Latest reports declare that the supply of natural gas in Pennsylvania will last for at least several generations yet. In Pittsburg and Alleghany City 105,000,000 bushels of coals are saved annually by the use of this gas for light and fuel..... .....The Georgia railroad commissioners insist that local rates on railroads must be made to bear the same relations to distance and quantity as through rates.....Tilden's will is to be contested by his nephews who do not think he did justice to them in leaving the great bulk of his property for public purposes. .....About 17,000 Knights Templar—the largest of the three orders of Free-Masons—have been having "a glorious time" at St. Louis at their 23rd triennial conclave. The Templars number about 65,000 in this country. ...The Odd Fellows, 30,000 strong, have had a "glorious time" at Boston. According to reports of officers, the Order in 1864, numbered in the whole world 137,263 members. To-day there are 517,310 members in American Odd-fellowship alone, besides 605,921 in the English branch, or Manchester Unity..... ....The English Government intends to make Esquimalt, British Columbia, "an impregnable harbor and an important depot for munitions of war."....The receipts of the Patent Office during the last fiscal year from all sources were $1,206,167, as against $1,207,974 during the preceding year, while the expenditures were $992,249, leaving a surplus of $213,918. The surplus for 1885 was $140,851.. .....Most destructive hail storm ever known broke 10,000 glass lights at the Oliver Plow Works and 12,000 at the Studebaker Wagon Works, at South Bend, Ind., Wednesday. City's loss, $600,000; Oliver's, $10,000... .....Terrific wind and rain storms in several other places during the week.....The centennial anniversary of the promulgation of the Constitution of the United States will be Sept. 17, 1887, and the Governors of the 13 original States will meet in Philadelphia to celebrate the occasion.....The total vote of Arkansas was 143,000—Democratic majority, 37,000. Legislature: House—Democrats, 67; Republicans and Wheelers, 23. Senate—Democrats, 27; R. and W., 5..... ....El Coyote, a famous Mexican partizan and bandit, who has done a world of murder and mischief along the Rio Grande, was surprised by troops and shot to death the other day.....A band of 382 Chiricahua and Warm Spring Indians have arrived in Florida where they will be kept on a reservation near St. Augustina—the bucks were the most turbulent, always ready for raiding and murdering....Geronimo and his followers, still in Texas, will soon join them. It is now thought that he will not be put to death. ....Over 7,000 Socialists met in this city the other night to sympathize with the Chicago Anarchists, and protest against their punishment.. ....Martin Irons is jailed in St. Louis for being implicated in the tapping of the private wires running into Vice-President's Hoxie's office during the Missouri Pacific strike. Owing to his bad conduct of late, his bailers surrendered him. He says he did nothing wrong, but is too poor to prove it.....The Mayflower has beaten the Galatea by a length in a "drifting race" off Newport, R. I..... .. A Mr. Bell, a Glasgow yacht-owner, has cabled a challenge for next year. Scotch yachtsmen have contributed $50,000 to build a vessel that will outsail any American clipper and take back the American Cup won by us in 1851.....

FOREIGN NEWS.

SATURDAY, Sept. 25, 1886

PARNELL'S Land Bill, as expected, was defeated in the British House of Commons, by a vote of 297 to 202. This is a decisive majority in favor of the Government (95), for if every man of the 394 Conservatives and Union-Liberals and every one of the 276 Parnellites and Gladstone Liberals had been in his place and voted, the majority would have been fully 108. Gladstone came from Bavaria to support the main principles of the bill; but the Conservative-Union-Liberal agglomeration was too strong....Disturbances have already begun in Ireland, where during the last three months evictions have been more numerous than in any like period since 1851—soon after the great famine. Rents fall due in November, and as it is certain that the full amount cannot be paid in most cases, evictions will be the order of the day. The Land League begs Irishmen and sympathizers with Ireland everywhere to subscribe liberally to aid the homeless paupers who will thus be turned out in the world in Winter. It proposes to decide how much each tenant can pay, and will advise that if that amount is not taken in settlement in full, nothing at all should be paid. If it attempts to usurp the functions of the government in this way, it will be suppressed and a "social war" is likely to break out over the island. Riots still spasmodic in Belfast; garrison to be heavily increased permanently. .....Agricultural distress in England is getting up a strong sentiment in favor of import duties on live stock and perhaps on cereals. Most of the Cabinet are known to favor a duty on imported stock. Much distress among the laboring classes, owing to dull business and consequent lack of employment. Wages low and going lower. Over 50,000 weavers going out on a threatened reduction of starvation wages ....The Bulgarian embroglio is still troubling the diplomats and threatening the peace of Europe. Russia seems determined to have her own way. Gen. Klaubars, for a long time Russian agent at Vienna, who "knows more about Austrian military affairs than any man in Europe," has been sent to Sofia to regulate matters, and the Bulgars have just been warned that any hostile demonstration against him will be an excuse for Russian interference. He is reported to bear an ultimatum demanding the immediate raising of the state of siege in Bulgaria, the liberation of all political prisoners, including those arrested for deposing Prince Alexander, and the indefinite postponement of the elections for members of the National Assembly. However, there are no signs of flinching on the part of the Regency; on the contrary, the anti-Russian feeling increases daily..... .....Austria is taking a more decided stand against Russia. German and French financiers are willing to make Bulgaria a loan. England is straining every nerve to counteract Russia's designs. Her old, sleepy Ambassador at Constantinople, Sir Edward Thornton, whilom of Washington, has been superseded by wideawake Sir William White, long an Ambassador to Roumania, who will be able to block Russian intrigues with the Porte..... Her late reckless expenses for enormous public works and appropriations for immense fortifications and for the army, added to her previous stupendous load of indebtedness, threaten to bankrupt France ere long. Her Republicanism isolates her from the rest of Europe, otherwise it is likely she would soon pick a quarrel with Germany..... .....The trouble with the Pope about the Chinese Nuncio is settled at least temporarily. A Legate to inquire about matters, is to go to Pekin instead of a Nuncio, and France "will scrupulously respect the concordat and will maintain the public worship budget as at present".....There has been an attempt at a revolution in Spain. A couple of regiments in garrison at Madrid broke loose, killed a few of their officers, tried to induce the rest of the garrison to join them, and, being attacked by the latter, fled to the country, where most of them have been killed or captured. The officers who instigated the movement will be shot, and the men severely punished. It is believed to have been got up by Zorilla to "bear" the money market; but it has "bulled" it, as the government of Queen Christina is considered stronger now than before it "drew the shot of the enemy," for a weak rebellion always strengthens the government.

AGRICULTURAL NEWS.

SATURDAY, Sept. 25, 1886.

MUCH dissatisfaction in Southern Colorado at the arrival of large numbers of Texas cattle on the range, as, apart from the danger from Texas fever, the range is already overstocked, and the grass short for home herds. Stockmen warned not to bring in any more.....Canada is quarantining and killing all hogs affected by, or suspected of hog cholera..... ....Not a case of contagious pleura-pneumonia in Ohio.....Texas fever is prevalent in a herd near Columbus, O.....There will be a three days' session of the Ohio State Grange, beginning Dec. 14.....Net profits of the late Ohio State Fair, $10,000—the most profitable ever held.....The Ohio State Board of Agriculture has petitioned the Government to immediately rescind the order made two or three years ago permitting the importation of Canadian cattle without quarantine. It also wants Canadian sheep quarantined. It fears the introduction of foot-and-mouth disease and pleuro-pneumonia.... Canadians are quarantining all cattle exposed to contagion from slaughtered and cremated cattle at Quebec, and slaughtering infected animals ....On the opening of the Dutch Parliament Monday, the King said Holland's crops were good and her cattle healthy.....Robert S. Schroeder, near Malone, N. Y., has about 250 acres in hops, which yielded about 500 bales this year—thought to be the largest single crop in the Eastern States..... ...The total number of entries of public lands for the fiscal year ended June 30, 1886, were 227,744, embracing an area of 20,991,967 acres. The amount of money received for this land was $7,412,767. The cash sales aggregated 3,773,498 acres, and the amount received there for was $5,757,891. Original homestead claims were made to the number of 61,638, covering an area of 9,145,135 acres. The list of selections made by railroad companies under the different grants aggregate 2,311,537 acres. The number of timber culture entries made was 34,966, comprising 5,389,308 acres. The remaining area disposed of consisted of military bounty land warrant locations, scrip locations, State selections, wagon road selections, and agricultural selections. Final proof was made upon 19,357 homestead entries, embracing an area of 2,663,532 acres, and timber culture entries covering an area of 141,694 acres. The above totals do not include the disposals of Indian lands, comprising an area of 1,132,596 acres, on account of which $1,607,729 were received.....

A Complex Case.

ONE of the most widely known men in the United States, particularly in the extending circles of Temperance organizations, is the Prohibition candidate at the recent election for governor of the State of New York, A. A. Hopkins, Esq., of the City of Rochester. He did not receive sufficient votes to elect, but one thing is certain, from the test of his qualifications in the editorial chair of a widely circulated newspaper, he possesses the ability to have filled the position with credit had he been chosen. The physicians to whom he writes the following letter, therefore, have reason to value it very highly as a voluntary testimonial:

ROCHESTER, N. Y., Dec. 2, 1885.

DRS. STARKEY & PALEN.—*Gentlemen:*—Permit me to express my hearty recognition of the good your Compound Oxygen treatment has done in my own household. One of our family has been several years afflicted with a combination of lung, head and nerve difficulties very severe, and resisting every form of medical application. He had tried physicians literally by the score; changes of climate South and West; and had grown hopeless nearly altogether. You know how *complex* was his case, and how apparently beyond help, for he visited you in person when but just able to be off his bed. You did not think him curable. Nor can I say that he was cured; but he was amazingly helped. He tried the Compound Oxygen with little faith in it, and his cough grew less, his strength greater. His nervous condition improved steadily. Whenever the Oxygen was intermitted for a time he lost ground. Last Spring he had become so well and strong that the Treatment did not seem necessary, and he gave it up. He had regained his former weight; his cough was rarely ever heard, by night or day; he walked about with vigor, and attended actively to business. His wonderful improvement surprised himself and all who knew him. Yours, etc.,

A. A. HOPKINS.

DRS. STARKEY & PALEN, 1529 Arch Street, Philadelphia, the dispensers of this remarkable curative agent, will send, without charge, their Treatise on Compound Oxygen, giving all desired information in regard to it, to any applicant.—*Adv.*

Crops & Markets.

SATURDAY, Sept. 25, 1886.

JUST for the present enough has been said here about grain crops; now for a condensation of the latest information from all quarters about some other crops: The potato crop was injured more in August than in any year since 1882, and the average condition is the poorest for September for ten years, except 1881. Little or no chance of improvement before digging, as there is usually a decline during the present month. Loss in condition almost everywhere—a decline of 7 points in Maine; 18 in New Hampshire; 3 in Massachusetts; 12 in Connecticut; 5 in Delaware; 15 in New Jersey. Drought the chief cause of loss in Northern New England; rot and scab in the rest of the mentioned section. Crop best in the Southern States, especially Louisiana and Arkansas; plenty of moisture and little complaint of disease or insects. In Pennsylvania the Colorado beetle has injured the crop. In Ohio, Michigan, Indiana, and Illinois the crop has suffered severely from drought, and from insects in many sections, while frost has been hurtful in some northern counties of Michigan. In Wisconsin and Minnesota the crop was very poor in August; but rains towards the close of the month materially improved the outlook. In Iowa, Missouri, Kansas and Dakota, however, there has been a still further decline, as the effects of the drought have become more apparent.

The condition of apples is reported high in the principal apple-bearing States; though there has been a decline during the past month in New England, the Ohio Valley and the Trans-Mississippi States. There is a falling off of five points in New Hampshire, the average being 93; two each in Massachusetts and Ohio, leaving condition 90. West of the Mississippi condition is lower, standing at 59 in Iowa, a loss of six points; 77 in Missouri, a loss of eight; 70 in Kansas, a loss of 15; and 59 in California—a decline of eight points since last month. In the North Atlantic States condition is high, except in New York, where it is only 61; but there is much complaint that the fruit is dropping badly as it approaches ripening. An unusual tendency to rot, attributed to the excessive moisture of the early Summer, is noticed in all the Southern States from Virginia to Tennessee: this, with other maladies in a few localities, has served to reduce condition in that section. In this market apples have been abundant during the week. The best wholesaled for not over $2.50 per barrel, and very good ones sold for $2.00, and common sorts for as low as $1. In Boston apples are so abundant it is is hard to sell them at any reasonable price—best $1.25 to $1.75; common to good 50 cents to $1.25. In Chicago prices are about the same as in New York—$1.20 to $2.50 per barrel, according to variety. Shipments of apples abroad are likely to be extremely heavy this year, judging by those to Great Britain for the week ending September 18, which were as follows: From Boston, 1,831 barrels; from New York, 6,001 barrels; From Montreal 536 barrels and from Halifax, 3,023 barrels; total, 11,391 barrels. Total shipments for season, 35,674 barrels, against 15,392 barrels in the same time last year.

The peach season here is drawing to an end, though there will be plenty for the next two or three weeks. The crop was considerably less than usual. Some complaints of fruit rotting before and after picking. Maryland crop very uneven even in the same orchard; some trees nearly bare, others overloaded. Rot very prevalent in the South, both in peaches and apples. In Delaware and Maryland heavy storms last week threw thousands of bushels to the ground. Western and Eastern fruit buyers are now in New Jersey, having mostly left Delaware and Maryland. Shipping directly from the orchards. New Jersey crop very fine. Smocks most esteemed for preserving, wholesaling from $1 to $1.50 per basket. Late Crawford, The Prize and Pullen's Seedling, all yellow peaches, most sought after for table use. Ward's Late Free good for either purpose. Owing to a better system of distribution, prices have been remunerative. The crop of the Lake States and the Northwest, a

comparatively small factor, is very much below an average. Michigan and Indiana return 63, Illinois only 23, and Iowa 33. On the Pacific coast California reports a small crop of good quality, while Oregon and Washington expect an outturn but slightly below an average. Last week the receipts in Chicago aggregated about 200,000 baskets, all sold at from 35 to 75 cents per full peck basket, according to size and quality. Oldmixons brought $1. Almost all came from Mich.

The cranberry harvest has been at its hight during the week. In the great cranberry section of New Jersey the crop is good—considerably better than last year. Owing to the destruction of many of the bogs by the recent forest fires, the Wisconsin crop is greatly diminished—probable yield not over 600,000 bushels against 900,000 bushels in 1885. Much of the crop last year sold for less than cost, and 150,000 bushels could not find a market. Considerable quantities were sent to England at a loss, as people there have not yet been taught how to use the berries. A considerable area of bog was also destroyed by fire in Michigan. Berries are now selling for 25 cents a quart in Chicago.

The Louisiana orange crop is usually marketed about this time. Reports from Calcasieu, St. Bernard, St. Mary, Cameron, La Fourche and other parishes in which the oranges are principally grown, report that the crop is a complete failure this year. It usually averages from 30,000,000 to 50,000,000 a year, but will not be 1,000,000 this year in consequence of the severe freeze last Winter. The news is uniformly bad from every portion of the State. In some places where 500 barrels were obtained last year, scarcely a barrel will be secured.

The clover seed crop varies greatly from year to year. This year the total area appears a little larger than last year, with an average yield and a promise of about a full crop. In 1879 the United States produced 1,922,982 bushels, nine-tenths of which was grown in seven States in this order: O., Mich., Wis., Ind., N. Y., Pa. and Ill. Yield per acre this year 130 to 140 pounds. Some pieces yield only one bushel (60 pounds) per acre, and only a few go over three bushels. Prices range from $4.25 to $8.75 per bushel, a fair estimate being about $5.50. In parts of N. Y., Pa. and Wis., the clover seed midge and clover weevil have greatly injured or entirely ruined the crop. Grasshoppers have been troublesome in O., Ind., Ia., and Mo. Drought has caused a great reduction in area and yield in Mich. and Ia., and to a smaller extent in Wis., Minn. and Mo. Area in N. Y., 20 per cent. less than last year; yield, 120 pounds per acre; price, $6 to $6.25. Pa., area 10 per cent. greater; yield, 10 per cent. less than a full crop; price, $5.75 to $6; yield per acre, 100 to 105 pounds. Large increase of area in Md. yield, 95 pounds per acre; average price, $6 per bushel. Virginia, larger area; 1.8 bush. per acre; $5.75 per bush. Full crop on 20 per cent. larger area in O.; 2⅛ bush. per acre. In Mich., 25 per cent. smaller area; 95 pounds per acre; average price, $5.62 to $5.75 per bush. Ind., 25 per cent. more area; nearly 2⅛ bush. per acre; average price, $4.75. Best crop ever harvested in one of the largest producing States. Decreased area in Ill.; yield, 137 pounds per acre; $5.25 per bush. Wis., 80 per cent. of a full crop on a somewhat reduced area; $5.75 per bush. Ia., area reduced 30 per cent.; yield, 35 to 40 per cent. less than a full crop; average price, $5.50 per bush. Mo., 75 per cent. of a full crop; area increased; yield, 2 bush. per acre; $4.25 per bush.

According to the census of 1880 the area devoted to hops in 1879 was 46,800 acres—product 26,546,378 pounds. New York had 39,072 acres and produced 21,628,931 pounds; Wisconsin, 4,436 acres; 1,966,812 pounds; California, 4,119 acres; 1,444,077 pounds; Oregon, 304 acres; 244,371 pounds. About half the other States grew a little; but their whole product would make little difference in the aggregate crop. The yards on the Pacific Coast have rapidly increased in size and number; while there has been a slight falling off in New York, and still more in Wisconsin. On the Pacific Coast the crop this year, while much larger than that of 1879, is a trifle less than that of last year. In Wisconsin there is a fair crop; a trifle less than that of 1885. Reports from every hop-growing county in New York speak of failure, total or partial, and the injury to the yards is likely to extend into next year, as the roots of the vines are considerably injured. According to commercial authorities the crop of the State last year was from 150,000 to 175,000 bales of 180 pounds each, of superior quality, while estimates of the crop of this year range from 5,000 to 15,000 bales of very inferior quality. Some consider two-thirds of the crop unfit for market. Dealers give the following comparative list of the yield in hops by counties: Schoharie, 1885, 35,000 bales; 1886, 500 bales; Otsego, 1885, 40,000 bales; 1886, 2,000 bales. Oneida and Madison, 1885, 70,000 bales; 1886, 1,500 bales. Lewis, 1885, 2,000 bales; 1886, 500 bales. Franklin, 1885, 20,000 bales; 1886, 1,500 bales. Montgomery, 1885, 20,000 bales; 1886, nothing. Bales vary in weight from 180 to 200 pounds. Since the irreparable damage to the new crop has become apparent, prices have already risen from five to 8⅓ cents to 25 to 30 cents per pound, and even higher figures have been given at interior points. A good deal of American hops that were sent to Europe on sale have been brought home and sold at a profit. The crops have been fair in England, Germany and other foreign countries, however, and as the duty on hops is only eight cents per pound, it is likely that foreign importations will prevent a rise to the extreme figures of some years.

Raw wool is remarkably strong, and prices are again higher, with movement to manufacturers heavy. The belief appears general that the American clip is short, and Australian is certainly worth more abroad than it is here...There is less satisfaction found in the tone of the grain market than elsewhere. Receipts at the Northwest have been very heavy. Export demand has been checked, and speculation is in favor of lower figures...Louisville reports a favorable tobacco coop, with prices favoring sellers.

MARKETS BY TELEGRAPH.

SATURDAY, Sept. 25, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 1c. lower; No. 2 Spring, ⅛c. lower. Corn, 1c. lower. Oats, ⅜c. lower. Rye and Barley, unchanged. Flaxseed, ½c. lower. Pork, 74½c. lower. Cattle, somewhat lower all round. Hogs, from 5c. to 20c. lower. Sheep, somewhat higher.

WHEAT.—Sales ranged: Sept., 73¼@74½c; October, 74@75¾c; November, 75⅞@76¾c; May, 83c; No. 2 Spring 73¾c. CORN—Cash, 37½c; September, 37¼@38c; October, 37⅜@38¾c; November, 39⅝@40¾c; May, 43⅜@43¾c. OATS.—Dull; Sales ranged: No. 2 Cash, 25¼@25½c; October, 25¾@26¼c; November, 27⅛@27¾c; May, 31⅛@31½c. RYE.—Quiet; No. 2, 48¼c. BARLEY.—Tame; No. 2, 58c. FLAXSEED.—No. 1, $1 08¼@1 08¾. MESS PORK.—Quiet; Sales ranged: Cash, $9 62½@9 75; September, $9 57½@9 80; October, $9 57½@9 90; November, $9 52½@9 70. LARD.—Quiet; Sales ranged: Cash, $7 20; September, $7 20@7 25; October, $6 62½@6 17½. Short Ribs.—Steady; Cash, $7 00. Boxed Meats.—Dry salted shoulders, $6@6 10; Short clear sides, $7 10@7 15. CATTLE.—Market Steady; Shipping steers, $3@5 30; stockers and feeders, $2 10@3 60; cows, bulls and mixed $1 30@3 20; bulk, $1 40@2 70; through Texas steers, strong; cows, $1@2 50; steers, $2 75@3 45; Western rangers, steady; natives and half breeds, $3@4; cows, $2 35@2 85; Wintered Texans, $3@3 85. HOGS.—Rough and mixed, $4 00@4 65; packing and shipping, $4 50@4 95; light weights, $3 05@4 65; skips, $2 50@3 90. SHEEP.—Market strong; Natives, $2 10@4 00, Western, $3 20@3 40, Texans, $2 40@3 10; Lambs, $3 75@5 00.

ST. LOUIS.—Compared with cash prices last week, No. 2 Red 1c. lower. Corn, ⅝c. lower. Oats, ⅛c. lower. Rye, 1½c. lower. Butter, steady. Eggs, ½c. higher. Flaxseed unchanged. Pork, $1 lower. Cattle, a trifle higher on an average. Hogs, from 5c. to 25c. lower, according to grade. Sheep, about the same.

WHEAT.—Weak; No. 2 Red, Cash, 74c; September, 71c; October, 71⅝@74½c. CORN.—Weak; No. 2 mixed, Cash, 35⅝@35½c; September, 35⅜c; October, 35¼c. OATS.—Dull; No. 2 mixed, Cash, 25¾@25½c; Sept, 25½c.; October, 25⅜c. RYE.—Steady at 48c. BUTTER.—Creamery, 21@21c; dairy, 19@20c. EGGS, 12½c. FLAXSEED.—$1 06. HAY.—Timothy, $10 00; Prairie, $8 00. PORK, $10 25. BULKMEATS.—Long clear, $7 00; short ribs, $7 00; short clear, $7 25. Lard, $6 85. Receipts, Flour, 6,000. CATTLE.—Market active; Good to Choice Native Shipping Steers, $4 40@4 85; Common to Fair, $3 75@4 30; Cows and Heifers, $2 25@3 50; Texans and Indians, $2 25@3 60. For the Young.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

THE director helped me take the names of the scholars, and then he proceeded to review the mental capacity of the school.

"First class in grammer rise!" he ordered, striking the desk a vigorous blow.

There was no movement on the part of the pupils. When he repeated the order in a louder tone, the little girl who had had the trouble about the seat rose timidly, and stood by her desk. She was the only one in the school who had ever studied grammar.

The director next called for pupils in elocution and mathematics, but not one could he induce to rise. When he spoke of arithmetic, however, the entire school jumped up in a body to show that there was one study that they understood. The director at last got tired of his examination, and with another warning speech took his departure.

I got along fairly well during the forenoon in arranging classes and lessons. It was impossible to arrange classes according to degrees of study. As there was only one book for every three scholars, the classes had to be made up by families, so there would be no need to buy new books. This seemed to be the principle upon which the school had been conducted before my time.

When at last I struck the bell for the noon recess, the scholars gave a loud shout, and rushed in a body for the door. I made some of them go back to their seats and march out in the usual style, but the larger boys had all run out to the road before I could stop them. The director had told me that the greatest trouble was likely to occur during the noon recess. He had insisted that I should remain in the school house during this hour to preserve order. I found that this order gave me the worst work of the term.

The scholars all seemed to have brought their dinner, even those who lived close to the school-house. The great dinner pails were emptied in a very short time and then began a season of the noisiest fun. Several boys began swinging with their hands on an iron bar that had been placed at one end of the room to strengthen the walls. Others played tag among the seats. It seemed as if they had all entered upon a shouting and laughing match. The boys all kept on their hats and there were certainly no cushions to the bottoms of their boots. By the time I had driven the boys away from the iron bar, some of them began to dance and whistle at the other end of the room. I found it necessary to shake several of the larger boys severely before the noise could be stopped. Gentle measures would not answer at all.

Then there came a dull and sullen silence. Most of the boys went outside where I could see them holding some sort of consultation. They seemed to be very deliberate in all their movements. It was necessary to hold a caucus before taking any decided action. The girls whispered together for a moment and then the largest one came up to my desk and simpered:

"Say, teacher, kin we play 'The Needle's Eye?' 'Taint no noisy game an' our other teachers always lets us play it. They joins in, too—like enough you'd like ter."

After making this request she burst into a giggle and threw her apron over her face. She ran back to the other girls and stood in the corner shaking with suppressed laughter.

I did not know the nature of the proposed game, but the name seemed quiet and harmless enough and I was anxious to please them, so I consented. I had a great mind to join in myself, but at last decided to wait and see what it was to be like. The large girl at once ran to the door and shouted: "Teacher says we kin play 'The Needle's Eye!'" There was a loud shout of approval from the company at the gate, and they all came rushing into the house without ceremony. The smaller boys and girls were at once pushed to the rear of the room, and the others proceeded to form in a circle just in front of my desk. A boy and a girl stood facing each other at each corner of a large diamond marked out on the floor. The other players joined hands in a circle and began to slowly move around between these four couples, who remained stationary at the corners. With one accord they began singing at the top of their voices:

"The needle's eye that doth supply
The thread that runs so truly,
It's oft I've passed a smiling lass
Before I did meet you.
With a bow so neat
And a kiss so sweet;
I do intend before I end
To stay here half a week."

The action was suited to the word in every instance. At the proper point of the song the entire company stopped to bow and at the next step the boy and girl next those waiting so patiently at the corners, assisted in the singing with a resounding smack, and then dropped out of the line to take the places of those whom they had so pleasantly liberated.

The smaller children, not to be outdone in entertainment, formed another circle at the rear of the room and shouted the song until the noise was deafening. In fact the only scholar who did not join in the game was the little girl who had cried about the seat at the opening of school. The rest tried to pull her into the circle, but she held stoutly to her seat. One great boy went to her seat and tried to kiss her there but on her appeal to me he ran for the door with all his speed.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—I wrote to you once before and my letter was put in the waste basket, but I thought I would write once more and ask you to let me join the Y. H. C. I live on a small farm of 35 acres on the Black Warrior River. We have another farm in East Tennessee of 185 acres. I have a dog, a cat, a cow, and some chickens and ducks. We have about 50 chickens. We have White Leghorns and Black Spanish Mixed, and Mamma has just bought some full blooded Plymouth Rocks to improve their size. I have a very nice boat named The Bird. I have four brothers and one sister but they are all away from home. Mamma and Papa like the RURAL ever so much. I like to read the letters from the cousins and I like the "Story of a District School" very much. I have 215 bird eggs; almost every kind that can be found in Alabama. I have a box of 25 different kind that I want to exchange with one of the cousins that live on the coast for sea shells. I hope you will print this. NELA MCCALLA.

Tuscaloosa, Ala.

[Those who want to exchange should write. —U. M.]

DEAR UNCLE MARK: I have been very much interested in reading the Cousin's letters and would like to join the Y. H. C. My Papa is a Michigan farmer. He is 40 years old and this is his first year at farming. He has 40 acres of corn planted, two acres of potatoes and two acres of broom corn. He planted the Angel of Midnight corn that the RURAL sent him, and it spreads all over the farm. He planted the watermelon and muskmelon seeds where there had been a pig pen for several years and they are not doing very well and Papa thinks the soil was too rich for the seeds and he is much disappointed for he is afraid he will not get the ten dollars that is offered for the largest melons. Money is what he is working for. My Papa has got three horses and a little colt and it's name is Tip. He is a fine colt, he is not small like his name. Papa has two fine Chester hogs and four little Chester pigs, also a great many black hogs, but I don't think these are worth mentioning for they always put me in mind of the black people. Your nieee,

East Milan, Mich. ANNIE KNOWLES.

[We musn't judge people, or even hogs by the color of the skin. We should judge them by what they can do.—U. M.]

DEAR UNCLE MARK: I am a little girl eleven years old. Papa has taken the RURAL for several years. We all like it very much, and I and my younger sister Kate like the letters from the young people and would like to join the Club. We live on a small farm one mile and a half from the village. Sister Kate and I had a garden this Summer and raised some flowers and vegetables. We help Papa too; we earned $15 picking berries. We play a good deal too, and ride on horseback and drive. We help by doing errands. We went to mill one day with the team. We like to do anything with a horse. But we must go to school next week. We have two Percheron colts and they are great pets. I could tell you a great deal more but I fear that dreadful waste basket as this is my first attempt.

From your nieces,

EDITH AND KATE VAN EPS.

Stanley, N. Y.

[You are pretty good workers I think. I have no doubt you help very much.—U. M.]

DEAR UNCLE MARK: I was 12 years old the 17th of August, and I suppose you are quite an old man—are you not? We are having quite a nice rain to-day, which is very welcome to the people. I hope you are not so needy for rain as we were here. The wells are failing. We will have about half a crop of corn. The small grain did very well. Granpa and Granma had quite a lot of small fruit this year, considering the dry weather. It has been so dry that our flower seeds did not come well; what came were very nice indeed. Uncle Mark, would you not like to live in the the country? I think I would like it better to live in the country than to live in a busy town like New York. Our school is out, and it seems as though we have nothing to do. I will stay at Grandpa's till school commences again. Grandpa milks six cows and has five little calves.

Liscomb, Ia. H. M. H.

[I am considerably older than you are, any way. I live in the country, too. I am only in New York during the day.—U. M.]

DEAR UNCLE MARK: The sweet peas came up and they are blooming nicely. There are five or six colors. They are very pretty. We have not many flowers this Summer, but we would have had a good many if it had not been so dry: everything is suffering from the drought. Mamma planted the Garden Treasures in small boxes. A few came up, but none lived except the Castor Bean. The Bird cantelopes and watermelons are growing nicely and we think we shall have a good many melons. We have had two watermelons. Papa caught a swarm of bees last Summer and they swarmed this Summer and about nine days after they swarmed the old hive was destroyed by the heat melting the comb and falling down on them. At the close of our summer school we had a picnic at one of the neighbor's groves. We had a very nice time, the scholars spoke pieces and dialogues. Two or three weeks ago Papa got up and he and the dog killed two skunks. They and the wolves have destroyed a good many chickens and nests for us. Uncle Mark you promised to tell us how you kept house on the plains. We have been watching the papers quite anxiously but have failed to see it, won't you please fulfill your promise. We are quite interested in the story of the District School. Mamma is doing without a girl this Summer, and we help her all we can; we wash dishes, sweep, make beds, iron and we can do a little of everything and I (Sarah) can bake real nice cakes. To-day we dried corn and Mamma tried to put up some your way and two bottles burst. Papa finished stacking yesterday and he has 15 stacks of oats and one of wheat.

Your Nieces,

SARAH and KATIE MCDONALD.

Greene, Iowa.

[A good letter. I shall tell you about my keeping house all in good time. I am glad you are doing so much work. I would like to try those cakes myself.—U. M.]

IT is getting pretty chilly about here. Now is the time to take care of the health. If we get cold now we won't be likely to get over it all Winter.

Hood's Sarsaparilla

This successful medicine is a carefully-prepared extract of the best remedies of the vegetable kingdom known to medical science as Alteratives, Blood Purifiers, Diuretics, and Tonics, such as Sarsaparilla, Yellow Dock, Stillingia, Dandelion, Juniper Berries, Mandrake, Wild Cherry Bark and other selected roots, barks and herbs. A medicine, like anything else, can be fairly judged only by its results. We point with satisfaction to the glorious record Hood's Sarsaparilla has entered for itself upon the hearts of thousands of people who have personally or indirectly been relieved of terrible suffering which all other remedies failed to reach. Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Apothecaries, Lowell, Mass.

100 Doses One Dollar

"AN EXCELLENT JUDGE"

The late Gordon W. Burnham of New York, after his return from an extended tour through Europe, said: "I have bought and tried the finest Shaving Soaps made in England and on the Continent, but for months have been longing to be where I could again enjoy the Luxury of Shaving with the GENUINE YANKEE SOAP."

All Druggists Keep It. Avoid Imitations. Trial Samples by Mail, for 12c.

PERSONALS.

BLONDIN, the tight-rope walker, lives quietly in London at the age of 62.

THE Rev. E. P. Roe, the novelist and nnrseryman, will spend the next two years in Southern California.

PRINCE BISMARCK is credited with the statement that a little blood letting by Russia just now would be conducive to the general health of Europe.

IRA D. SANKEY, the revivalist, says he does not regard Chicago as the worst city in the Union, but as very inflammable. This probably accounts for its dynamite propensities.

BARON ROTHSCHILD rode by special train from Glasgow to London, at 60 miles an hour, when he heard of his mother's alarming illness in Paris. In London he learned of her death.

FRANCIS A. WALKER, Chief of the census of 1880, and boss statistician of the country, estimates that the population of the United States in 1900 will not fall far short of 80,000,000.

MISS STANLEY, a Dakota girl, spent the Summer entirely alone, without even a cat for company, on her claim four miles from Waterbury. She had 10 acres of grain, a fine garden and a watermelon patch.

THE much-talked-of General Boulanger has sagaciously directed his attention to the songs of the French people, and ordered that the national air for the French soldiers shall be "*Mourir pour la patrie.*"—To die for our country—a popular French song.

BOB and Alf. Taylor, Democratic and Republican candidates for Governor of Tennessee, who travel together and hold joint disenssions, had the first little "spat" Wednesday, but "made it up" directly afterward, and are still acting "quite fraternally."

IT is suggested that a reunion of the dethroned—or uncrowned—royal personages of Europe would be an interesting event. The group would include Isabella and Don Carlos, of Spain; Eugenie, "Plon-Plon" and the Comte de Paris, of France; the Duke of Cumberland (King of Hanover), and Alexander, of Bulgaria.

MRS. U. S. Grant invited President and Mrs. Cleveland to stay at her honse in Elberon on their way back from the Adirondacks. She received a reply from Mrs. Cleveland thanking her very kindly, but regretting that pressing bnsiness of State made it neeessary for the President to go straight through to Washington.

GERONIMO is 62 years old, stands five feet nine inches, and weighs 190 pounds. He is as straight as a ramrod and shows little signs of age. Hair long, black and glossy. Face "rather good-natured, lit up with frequent smiles." The real chief of the Chiricahuas is Natchez, "a tall, powerful-looking Indian." Geronimo, however, is leader in war.

THE four Acken brothers, of Middlesex County, N. J., are fine men. William is 83 years old, six feet three inches in hight, and weighs 250 pounds; Henry is 81, six feet four, and weighs 270; Samuel is 70, six feet five, and weighs 225; Theodore is 73, six feet six, and weighs 230 pounds. They are in excellent health and vigorous beyond their years.

SENATOR EVARTS'S country seat in the upper valley of the Connecticnt, comprises 800 acres of meadow and forest. The Senator entertains like a prince, and Mrs. Evarts is described as a queenly woman in her domestic sphere or in social duty, closely resembling the portrait of Martha Washington, which hangs in the East Room of the White House.

THE largest pension ever paid in the United States was paid at the United States Pension Office, in Louisville, Ky., Thursday, to Marcus D. Richardson, an aged soldier living at Milton, Ky. The cause for granting the pension is total blindness, brought on by an injury to the eyes received in the war in 1863. The pension dated back to that year and amounted to $11,500.

Two or three years ago Phil Armour saw a negro porter in a palace car industriously trying to spell ont words in a well-thumbed reader whenever he had a moment's leisure. He became interested in the boy and offered him $25 if he'd read six lines before the train reached its destination. The porter, by hard work, earned the money, and now he is a student in Oberlin College, sent there by the generous Chicago packer. He is very black and very ambitious.

Sheep Husbandry.

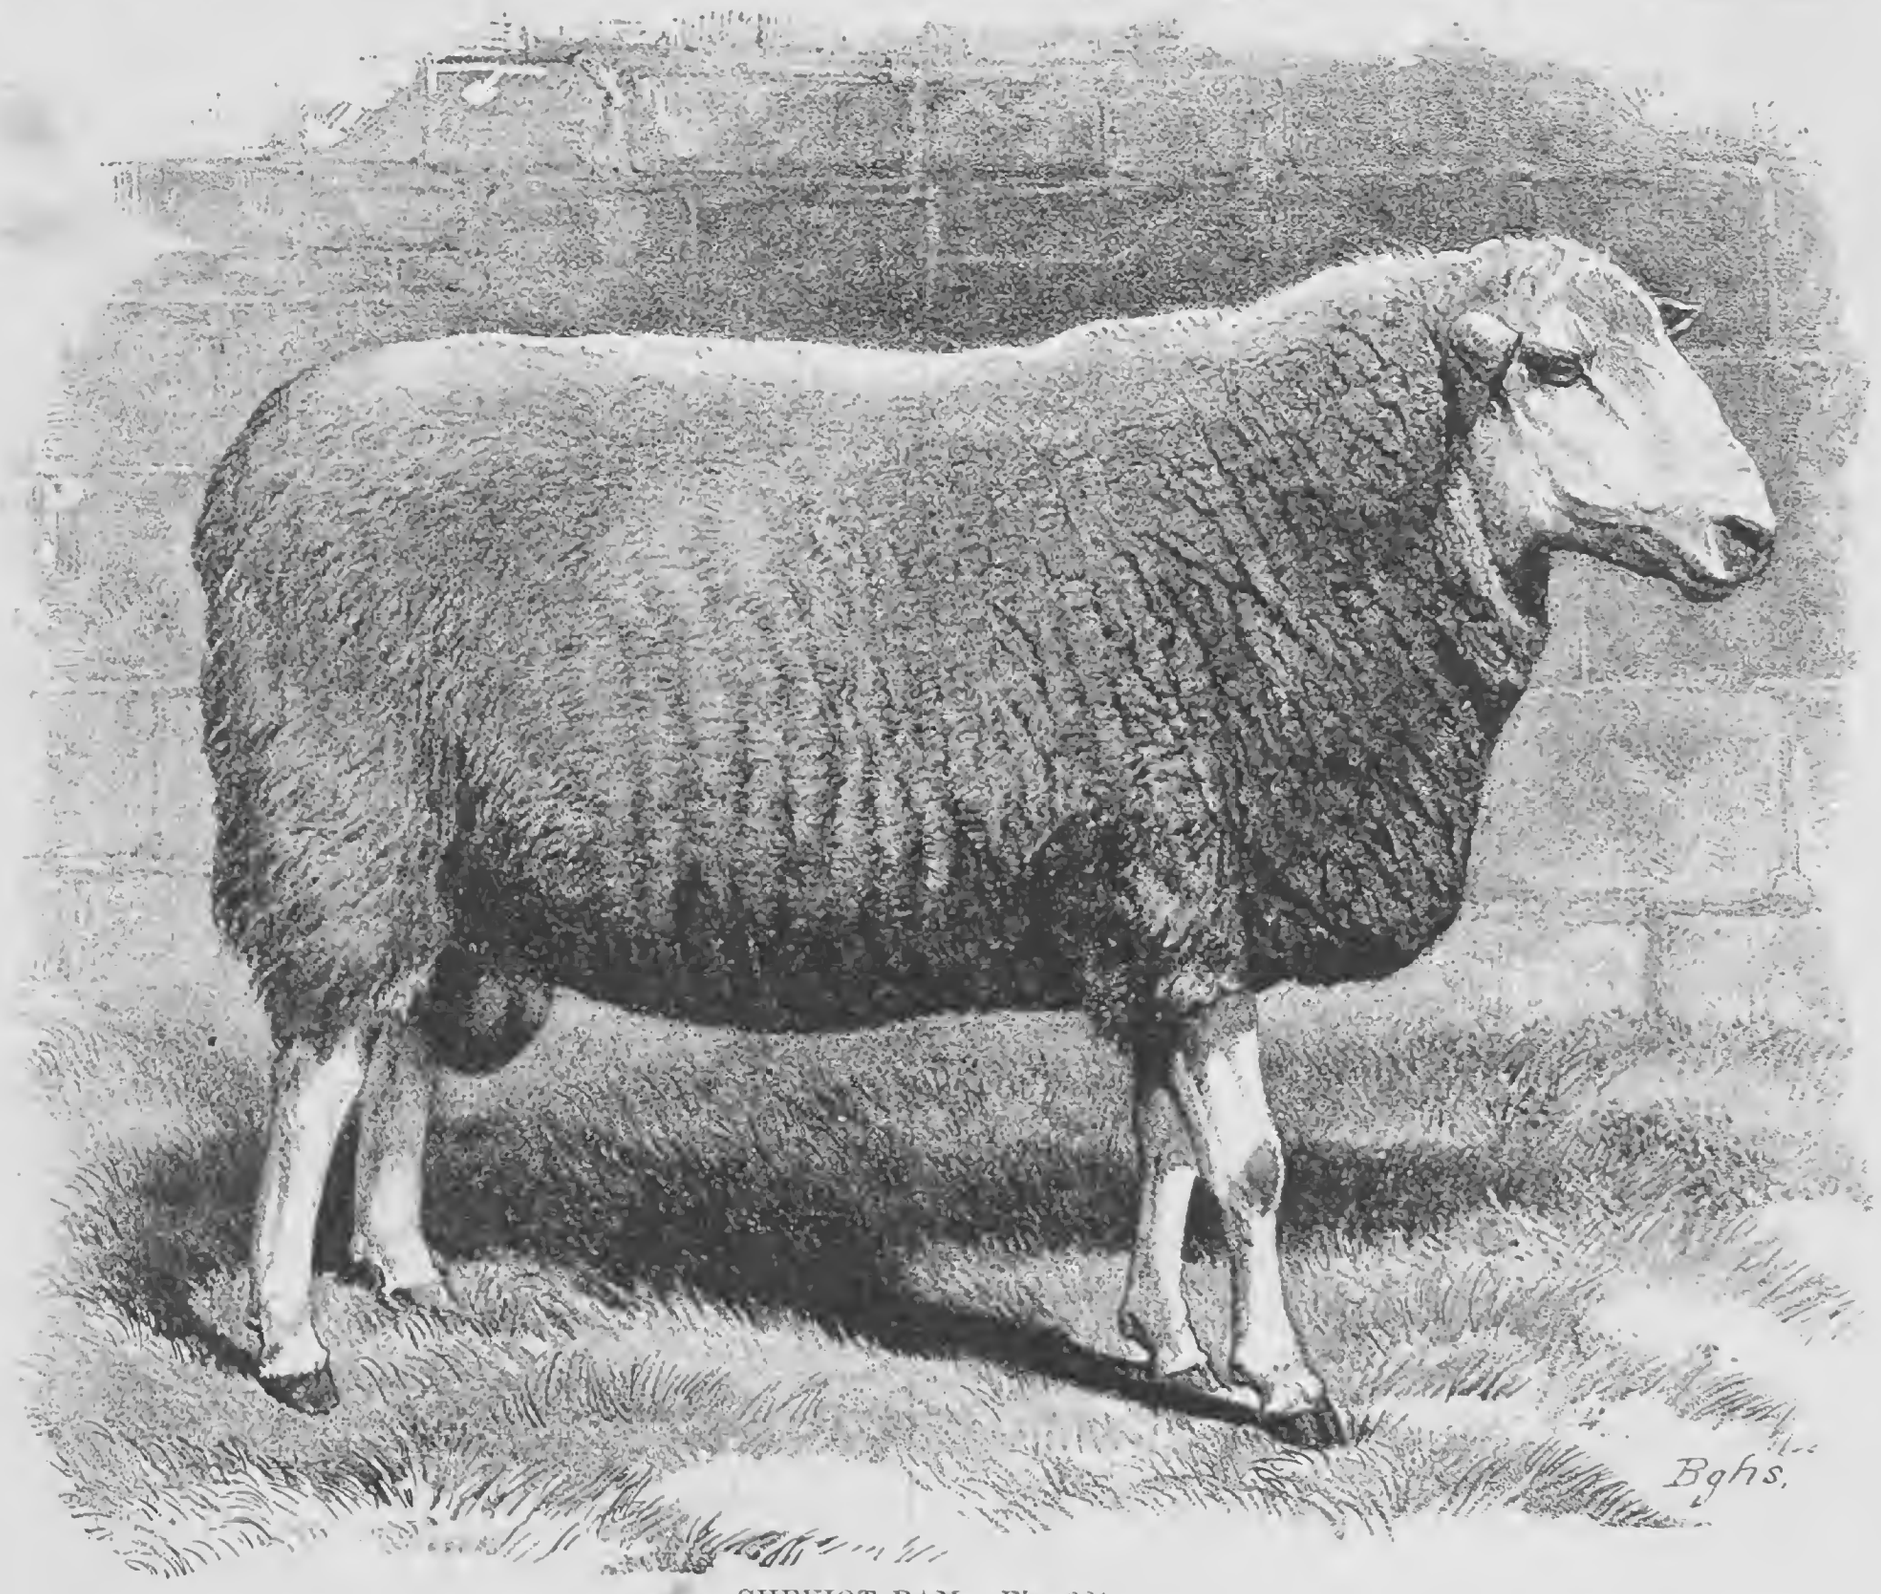
THE CHEVIOT SHEEP.

HENRY STEWART.

Home of the Cheviots; their origin; old-time Spanish sheep; Cheviots "excelled by none; equaled by few;" excellent for wool and mutton; sections best adapted to them in this country; mountainous North Carolina; weights of wool and mutton;

THE Cheviot sheep inhabit the range of hills or low mountains on the southern boundary line of Scotland, and the nothern part of England. It is a cold, bleak region, but has long been occupied by a race of hardy industrious farmers who have made the rearing of sheep and cattle their chief business. Two hundred years ago and more, when wars disturbed the peace of the two countries, this border-ground was the scene of constant raids, forays, and encounters between the partisans of the political leaders on either side, who made politics an excuse for "lifting" cattle and sheep. The excellent cattle and fat sheep of the hills even in those days, had a reputation which too often brought loss and trouble upon their owners, or defeat and disaster upon those reckless ruffians who "came down like a wolf on the fold" to rob and harry and kill. The sheep of the Cheviot hills lived then on the mountain pastures, which afforded rich, nutritious, but sparse herbage, well calculated to develop a useful animal, having a good fleece and fine-flavored mutton. It was said by the shepherds that their sheep originally came up out of the sea, and this tradition is believed to have originated from the fact that some of the ships of the Spanish Armada which was sent to conquer England in the days of Phillip II of Spain, and "Good Queen Bess" of England, were wrecked on the coast of the hill country, and the sheep carried for the supply of fresh meat escaped from the wreck and swam ashore. The sheep of Spain at that time were the best in the world. The Merinos had descended from flocks which were renowned when Spain was a part of the Roman Empire, as they furnished the fine wool of which the imperial purple robes were manufactured and which were more costly than silk then brought in caravans all the way from China. It was from Spain that the excellent Cotswold sheep were brought to England as a present from the Spanish to the English King, and the Cheviots coming from the same sources were, beyond a doubt, as excellent as the other Spanish breeds. Of late years, and since quiet came to the border by the union of Scotland and England, the hill farmers have greatly improved their sheep, and the Cheviot breed is now "excelled by none and equaled by few" of the English and Scotch breeds. The Cheviot is a large sheep, as large as the Cotswold, but a better mutton animal and has finer wool and a closer fleece. The wool furnishes the material for the soft, durable clothing goods known as "cheviots," which are so popular in England and the United States, and is not too long for carding in the common country mills for the manufacture of flannels, cassimeres, jeans, and blankets. The mutton, of course, is affected greatly in quality by the food; but where, in America, similar conditions can be secured, the sheep will yield meat as highly flavored and as tender and sweet as in their native home. It is a mountain sheep, and Northern New England, Western Pennsylvania, the Rocky Mountains and the Cascade Ranges, especially, and the Southern Mountain region from West Virginia to Alabama are all well adapted for these sheep, and will furnish them with precisely the pastures and climatic conditions most suitable for them. A moist climate produces a soft, lustrous wool, and naturally affords continuous nutritious herbage. Here, in the Southern mountain region, where the rainfall is 60 inches in the year, and descends in gentle showers at short intervals, and where consequently there are no droughts; and the soil, rich in potash, produces a varied herbage of wild pea vines, short grass, nutritious plants and undergrowth, and the very best of all the cultivated grasses and clovers, as well as roots; and where the short, mild Winters permit outdoor grazing, with the finest and well sheltered ranges in the open grassy woods, excepting for two or three weeks in January, these sheep find everything they require and enjoyed in their native home.

The engraving (Fig. 381) is a likeness of a two-year-old ram bred and owned by Mr. William Curry, Hartwick, Otsego County, N. Y. He received the first prize in his class at the State Fair at Albany in 1885. He weighs 200 pounds, and is an excellent specimen of the breed. My pure yearling ram weighs 180 pounds, and a pure-bred ewe now nursing her lamb weighs 160 pounds. A spring lamb weighs 70 pounds. One of my rams sheared 11 pounds last year and 8½ pounds this; the ewe 7½ pounds. The custom here being to shear twice a year, my flock were sheared Aug. 30, and the weights of the fleeces were: ram, 5½ pounds (five months' wool); yearling ram, 4 pounds; ewe, 4 pounds; spring lamb, 3¼ half-bred spring lambs, 2½ to 2¾ pounds; and three-months'-old lambs yielded two pounds to the fleece.



CHEVIOT RAM. Fig. 381.

The Cheviot crosses well upon the common native sheep, and the best of the half-breeds can scarcely be distinguished from the pure-

bred sheep. As this sheep is but little known as yet in America, its good qualities, its entire adaptation to so large an area, and the useful quality of the wool and the mutton render it worthy of notice by shepherds, especially by the farm shepherds who keep a few sheep for a domestic supply of meat and a little wool.

Macon Co., N. C.

A LITTLE FLOCK OF SHEEP on every farm would add millions to the public wealth. Fifty million sheep could be added to our present stock of the same number, and would be wholly absorbed in the domestic supply of the farmer's homestead. A lamb from the flock furnished an acceptable meal for the family of the ancient patriarchs and an honored guest, and many a modern patriarch surrounded by his rising generation would find a lamb agreeably useful, and far more desirable than the too common pork or bacon. A sheep too could be easily divided—turn about—by a few neighbors. The skin, tanned and dyed, would furnish the dwelling with mats and rugs, and the wool would meet with the readiest sale at the stores.

SHEEP REQUIRE TO BE WATCHED.—The rule of the good shepherd is "count the flock whenever you see it." There may be one missing, fast in a fence corner, sick, perhaps; but immediate help would save it. It is a remarkable thing about sheep that they are as valuable for their indirect worth as for their direct contributions to the farm profits. A flock necessitates such a culture of the land as is the very best for the farm, and it furnishes the richest manure to make this culture perfect. So in the act of counting the sheep, the habit of close observation and precision is formed and encouraged, and many a thing which might go amiss is discovered and set right in good time, merely because the counting of the sheep makes the farmer keep his eyes and wits about him.

The Herdsman.

COLORADO CONCEITS IN STOCK RAISING.

B. F. JOHNSON.

Sacredness of the cow and calf; Colorado beef; stock risks on the ranges; sheep and horses better than cattle; Alfalfa; its advantages in the South; its culture; enthusiastic about it; the ranchman and cowboy "must go."

LET us use the word conceit in the sense of idea, but an idea gained from experience. Thus a cow in Colorado is nearly as sacred and safe from the knife of the butcher as a cow in India, where she is worshipped as a goddess. It results from this that all beef sold by the butchers is from bullocks and generally those of three years or more. It is far from being as fat as cow beef offered in average Middle State and Eastern markets, nor has it as decided and ageeable a beefy flavor, but it is tenderer and juicier in all the eating pieces from nose to tail.

In Colorado and other cattle ranching sections, ranchmen associate, incorporate into companies to buy the steers, and do the slaughtering on a large scale, such a thing as a butcher buying steers and doing his own slaughtering being nearly unknown. This is a measure of protection on the part of the ranchmen who, by keeping a record of the brands of the stock they kill, defeat the efforts of the cattle thieves who are the scourge of the ranges.

But veal calves are in some senses held as sacred as cows, and when the best cuts of beef are sold to hotels and large boarding houses at 11 and 12 cents a pound, veal cannot be contracted for, for less than 18 cents. The cow is held in great respect for the calves she will bring and the calf is held in respect nearly as great for the steer or cow it will make.

It is a pity some of this Colorado conceit in respect to butcher's stock could not be got into the heads and hearts of butchers and meat consumers in the large and small towns of the corn, grass and cattle States, where cows, and even cows giving milk, and other cows big with calf, but in a good condition of fat and flesh, furnish nine-tenths the beef consumed. And as to veal, every calf is caught up and slaughtered that can be had, and is sold at an advance of not more than 25 per cent. over beef. To show the pecuniary risks run by ranchmen, who, buying unacclimated stock from the South, carry, or attempt to carry them through the Winter on the ranges without grain or hay, a ranchman was pointed out to me who had recently bought 2,000 head of Texas two-year-olds, on the basis that not over 200 would survive the Winter.

But sheep do better, and if a provision is made to feed a flock for 30 days, they may be wintered with as little loss as in Illinois or Kentucky. In fact, Colorado soil, climate and situation favor sheep, horse and mule raising rather than neat cattle, and to that complexion will it come at last—with the aid and assistance of Alfalfa in the irrigated sections and wherever else it can be grown.

Still using the word in its original and best sense, there is no "conceit" so prevalent among Colorado farmers, sheep and horse men, as the conceit as to the great value of Alfalfa as a forage and green crop, in one. The yield of green and dry forage, the completeness of the stand and its permanence for 30 or 40 crops, (three every year) to say nothing of the attractiveness of the deep, dark green of the growth before, and its beauty later, when it is a mass of purple bloom, must be seen to be appreciated. It is, in fact the Timothy, Blue Grass, clover and corn of the farther West, and as such it is not too highly valued.

This brings me to the point of saying to the planters and farmers of the cotton belt, if they could get into the conceit of growing Alfalfa, it would go far to shorten the time one-half, till that revolution in farming all Southern men are looking for, would be accomplished.

The great and crying want in the South all through the cotton belt, is the scarcity of green forage, from July to October. From this want on the uplands, stock are driven to the river bottom, where bad water is the rule and malaria universal, and hence the prevalence there of charbon, dry and bloody murrain, and many diseases farmers of the North have no just conception of.

Like cotton, Alfalfa is a warm and dry climate plant, and if copiously and properly irrigated will produce enormous crops under the heat and drought of terras callientes. In the cotton belt any good cotton land will produce it in a manner satisfactory to the grower; and when sown on really good land and annually fertilized, it will become a bonanza. Prepare the land as for a grain crop; but with about five times as much labor in the operation. Sow 30 pounds of seed to the acre, broadcast, or, better, in drills, as soon as all danger of frost is over in the Spring. The first year cut the herbage but once in the season, and do not allow a hoof of stock upon it until 18 months after the seeding—or, better, not at all for a generation. This interpolation is what may be thought a sort of apotheosis of Alfalfa, and may be regarded as a piece of extravagance on the part of the writer, but it is one anybody is liable to who has had the writer's experience.

Quite to my surprise I found in Colorado as strong a feeling against "hog butter" and the syndicate of money sharks who were attempting to influence Congress and the President, as in Illinois. And more to my surprise, I found a fast-growing sentiment that the ranchman and his henchman, the cowboy, "must go." The original ranchers made the mistake of fencing up the country without the shadow of a right to do so, and the worse mistake of attempting to drive the pioneers of small means out. These things have never been forgotten or forgiven, and if the sentiment grows as it seems to be growing, the popular estimates of the Western farmers for the cattle men, the cowboy and the Indian, will be nearly on a par.

BOGUS pedigrees have done much to injure legitimate stock breeding. A committee appointed by the A. J. C. C. have prepared the draft of a law which shall prevent further trouble. It provides that any person who shall obtain by false pretence from any company for the improvement of domestic animals, a certificate of registry, upon conviction shall be punished by imprisonment in a State prison for a term not exceeding three years or in a county jail for one year, or by a fine not exceeding $1,000, or by both fine and imprisonment. It is to be hoped that the legislatures of the various States will take hold of the matter and pass suitable laws for carrying out this idea. It is a good one.

Dairy Husbandry.

METHODS OF PRO-RATING BUTTER VALUE IN MILK OR CREAM.

Defects of the Fairlamb system now generally abandoned; test churns, and objections to them; oil test churn; with cream and milk; its advantages.

THE oil test churn is now a part and parcel of the cream-gathering system of butter making in several of the Western States. It is about 10 years since the system had a pronounced start, and was first known as the Fairlamb plan, and was conducted for a time with the use of a patented can of peculiar construction and uniform size and shape. The theory was that 113 cubic inches of cream, raised by the rules given for managing the can, would yield one pound of butter, and a guage to show the cubic inches above the cream line on any can filled with milk, and standing till full separation had taken place, was a part of each can. The owner of the milk and the cream gatherer looked at the "guage," and determined the amount of butter the cream would make, and the assumed facts went on the record and determined the weight of butter the patron should be paid for. A factory was projected and operated one Summer in accordance with the plan, and the belief obtained with the inventor and many of the farmers that a way to justly prorate the value of the butter in the milk of all sorts of cows had been discovered. The writer very well remembers the first public appearance of the can, and of the inventor, now deceased, at a Western dairy convention the following Winter, and the troubled anxiety there was on the brow of the latter, when upon sounding several of the dairymen and manufacturers he was most anxious to have believe, he found them not only skeptical, but some of them pointed out the radical defect that has led to a pretty general abandonment of the whole "guage" theory; for though the method had a great run, it was soon proved that from the cream taken to the same factory 113 cubic inches would make from one half pound to one and a half pound of butter, showing it was no reliable measure of value at all, of a miscellaneous lot of cream. The half pound man got another half pound that belonged to a neighbor; and the 1½ pound man lost a half pound that was passed over to the first named.

This kind of work could not last, and so test-churns came upon the stage. These were small glass jars, holding two quarts, into which one quart of each patron's cream was put at each gathering, and then churned at the factory, and the value of the cream taken at the farm was computed from the actual butter yield of the specimens separately churned. Thousands of such test jars are in use now, and quite accurately determine the butter value of any body of cream. The objection to them is the great waste of product and the cost of the skilled labor it takes to make the tests fairly certain and satisfactory.

Then came the oil-test churn, which was operated in very much smaller glass jars or tubes—10 inches long and only seven-eights of an inch inside diameter. Each of these is filled just half full with a sample of each man's cream, to a mark on the tube, and then all are churned at once, or from 50 to 200 at once, according to the number of patrons of the factory and the capacity of the test churn used. The tubes are then plunged in water at 150 degrees, when the butter fat rises to the top, and a scale and rule determine with essential exactness the weight of butter in the cream taken from the farmer on the day corresponding, by the per cent. of fat in the specimen. The test is so exact and reliable that all criticism is substantially superseded. It decrees justice between rich and poor milk, and makes skimming to make bulk simply a loss of skim-milk. It leaves each owner at full liberty to exercise his choice of breeds, and gives exact pay for the butter contributed to the pool.

Later on has come the oil test churn in which in tubes of the same size milk is used instead of cream. With these the butter value of milk can be determined as it is delivered at factories for making either butter or cheese. In the latter case the cheese-making value of milk is determined from the butter value (which is near enough), though both might be determined, for the caseine is separated as well as the fat. In using milk in the tubes, they are filled the same as when cream is tested, and then set in ice-water till a full separation of the cream is effected, which is then churned the same as when cream is used. Of course there is less butter than from the same bulk of cream, but so fine and exact are the scale and rule that essentially the same answer is obtained touching the butter value of the milk, as when cream is taken for the test. A novice could hardly believe it, still it has been proved that the samples of milk told the amount of butter from about 4000 pounds of milk so closely that one-fourth of a pound added to, or substracted from, each patron's credit for butter, would make a greater variation than the test made between the report and the actual weight of butter as packed in the tubs. There is no waste of product through the oil-test churn, because the amount taken is so small that it can be returned to the cream vat as soon as the rule has been applied, and it has no appreciable effect on the quality of the mass of butter. When the large jars were used, and the butter from each was weighed separately, it had to be packed as a lower-grade article. The milk-testing method is now so exact that it was relied on to test the cows that were exhibited at the late Minnesota and Iowa State Fairs. BADGER.

Cedarburg, Wisconsin.

The Swineherd.

PIG PARTNERS.

COL. F. D. CURTIS.

THE way for the small farmer to make money out of his hogs is to take them into partnership. This can be done in a number of ways. At first they will take the sour milk and turn it into money in the most profitable way it can be done. Experiments have shown this. The kitchen slops, which often defile the back door, can also be used by the active partner, and, if strengthened a little with middlings, they will rapidly turn into cash. Then come the weeds. I have found out what the most of them grow for—to feed pigs. Those that they won't eat will make good manure, and here the pig is a partner worth having.

There are lots of things which litter up the grounds and make them look rough and unkept, which the pigs will help to get out of the way. The only vehicle necessary to do the business of the firm is a wheelbarrow. It can be loaded both ways, taking weeds to the pig-sty and going back with manure for the crops in the garden. Nothing like hog manure out in the lot where it was plowed under for the fodder corn. The stalks are twice as large as they are where the barnyard manure was put. It is so every time. The pig will turn the plantains, the purslane, and the lawn grass to the best account. A friend had a field full of wild morning-glories, and they ran the crops out so badly that it hardly paid to cultivate the land. He got a hint from Kirby Homestead, and bought up a lot of shoats, took them as partners and turned them into this field. Every day some shelled corn was scattered about and the hogs ate it and rooted around for more and so got a taste of the roots of the morning-glories, and they kept rooting for them until the field was entirely cleared.

Another had a large lawn full of live-for-ever, and it defied all cutting, hoeing and salting. The despised pig was turned in and fed just enough to keep it keen and smart, and it went to rooting. The door yard did not look very inviting that season, and passers-by wondered at the taste, but the pigs cleared out the live-for-ever so thoroughly that not a vestige remained, and the next Spring there was the clean ground to make a smooth and handsome lawn. Pigs will worry thistles awfully in the same way, and all other foul stuff. The land always welcomes their presence, judging by the expression afterwards.

Where pigs are kept there will always be good crops. Pigs should be taken as permanent partners, but the location should be changed frequently. Two years is long enough to curry on business in the same place. For this reason portable shelters are a good thing, or it may be so arranged that the shelter shall be stationary, but the feeding place should be all around.

Horseman.

GENERAL PRACTICAL HINTS ON HORSE-SHOEING.

F. L. KILBORN.

Usual method of shoeing faulty; how often to shoe; judging by the hoof; form, size and weight of shoe; calks injurious; preparation of hoof; the sole, frog and bars; putting on the shoe; preserve the surface horn.

As generally practiced shoeing, instead of being a source of comfort and security to the horse, has been and continues to be a source of great discomfort and misery. In fact, the diseases of the limbs and feet of the horse are largely due directly or indirectly to faults in shoeing. A successful farrier should be familiar with the general anatomy of the foot, and with the rational principles and practice of shoeing both in health and disease.

As to the frequency of shoeing, no definite rule can be given. Young animals require shoeing more frequently than old. A very good general rule is to shoe every month. Rarely young animals with very rapidly growing hoofs or those that wear the shoe unevenly require shoeing oftener. Too frequent shoeing is likewise to be avoided, because it necessitates the driving of so many nails which are always, unavoidably, more or less injurious to the hoof. Horses working daily on hard pavements may require shoeing as often as every week. Old animals may frequently be allowed to go two months, but rarely can a valuable horse be safely allowed to retain a shoe longer. As a general rule, however, one month is much better than two. The too common practice with many farmers of allowing the shoes to remain until accidentally lost or en-

tirely worn out (in this way often remaining five or six months), is highly injurious to the feet.

In any case the hoof wall should not be allowed to grow out over the shoe so as to cover it and thus throw the pressure largely upon the sole, nor should the shoe be allowed to be carried forward, especially in the fore feet, so as to let the heels of the shoe press upon the back part of the sole, altogether giving the horse an unnatural, flat-footed appearance. This carrying forward of the shoe is due to the tendency of the hoof when shod to increase in length at the toe, and thus to advance the shoe.

The form and size of the shoe, although of minor importance, are still of sufficient importance to demand our attention. The shoe should be neither too thick nor too heavy. There is very little danger of its being too light. It is very tiresome for a horse to be obliged to constantly carry unnecessarily heavy shoes, and they also increase the concussion of the limbs and feet. The light, thin shoe is without these objections, and allows the frog to reach the ground. In general, the weight of the shoe should conform to the size of the animal and the work expected of him. It should be of only moderate width. The broad shoe is a very poor "catch." Both surfaces should be perfectly level, *i. e.*, the shoe should be "true" and of the same thickness throughout. The hoof surface should be flat, not beveled as is the common practice, which throws all the support upon the wall, and allows dirt and gravel to work in upon the bevel between sole and shoe. With the flat shoe the support is divided between wall and sole as it should be, and there is not the danger of graveling. In outline the shoe should be the exact counterpart of the hoof after it has been properly prepared; to apply a shoe that is too small and then rasp down the hoof to correspond, not only shows poor workmanship, but is very injurious to the foot. A clip at the toe of each shoe, or in special cases one on each side of the hind shoes, can usually be added to advantage. But they must not be set too deeply into the wall nor drawn too tightly when hammered down.

Calks, or as they are more commonly called, "corks," are always injurious to the limbs, however necessary they may be to enable the foot to hold. Upon ice or hard snow, they, or some similar device, are a necessity, and must unfortunately be used. With this exception, there are rare instances where calks are necessary. When used, however, they should be of equal hight at heel and toe. Nearly all farmers could well do without them during the summer months at least. Even on the paved and concreted streets of our cities the properly made, flat shoe is less liable to slip than the one with high calks. With a narrow shoe beveled on its wearing surface from without inward—to correspond to the natural bevel of the normal foot—and a healthy frog brought into use, there is in most cases no danger from slipping. The reason why most horses slip so easily as soon as the calks are worn down, is because the frogs have become dry and contracted and the shoes are made too wide, with a smooth, level wearing surface, both conditions being very favorable to slipping.

The preparation of the hoof should receive special attention, this being the most important part of the operation, and also the part most frequently unsatisfactorily performed. The wearing surface of the wall should be rasped or pared until perfectly level, and the two sides be of the same hight, so that a plane across them will be at right angles to the pastern. Usually the paring has to be done mainly at the toe, but the obliquity of the pastern and form of the foot must be the guide. Where the wall does not project beyond the sole no paring is required; and when paring is necessary it should be carried nearly to, but never beyond the border of the normal concave sole. This removal of the excessive growth of the wall is usually the only paring that is allowable, any additional being not only unnecessary, but almost invariably highly injurious. The wall having been worn or pared to the level of the sole, both may be rasped until the latter, especially at the toe, presents a bearing surface equal to one, or one and one-half times the width of the wall. This allows the sole to bear a portion of the weight, which in its natural condition it is abundantly able to do. Finally the sharp border of the wall ought to be slightly rounded with the rasp to avoid the danger of splitting.

The healthy sole should never be cut. The shedding of the hard, dry, horny scales from the sole is a natural process that will best take care of itself. And unless the flakes are liable to become imprisoned under the shoe, especially near the heels, it is much better for the foot that they be left to shed naturally. It is permissible, however, to remove any flakes that are loosely attached, but nothing more. The barbarous custom of paring the sole until it will give under pressure of the thumb ought not to be tolerated.

The idea that the frog must be reduced, that its coming in contact with the ground will lame the horse, is a very injurious popular fallacy. On the contrary, the frogs should not be pared any further than to remove rugged ends, and should if possible be *made* to come in contact with the ground. This is one of the most important safeguards against contracted feet. The paring of the bars, "opening of the heels," is equally injurious and should not be allowed. The sole, frog and bars are all important factors of the hoof as a whole; they are the natural protectors of the ground surface of the foot, and should be left intact.

The application of the shoe and careful driving of the nails require no little skill. To secure a perfect fit the red-hot shoe is carefully applied to the hoof for a few seconds, when any little inequalities are readily seen and removed. This secures a perfect fitting of shoe to hoof, which it would be almost impossible to obtain by a cold fitting. While the brief contact of a red-hot shoe to the hoof is in a general way beneficial, it becomes very injurious if applied too long, so as to fuse more than the surface horn. The shoe being accurately fitted, is cooled, filed and finally nailed to the hoof. In driving the nails it must be remembered that the hoof wall is thickest at the toe and gradually becomes thinner towards the heels, the inside quarter being thinner than the outside, and the nails should be driven accordingly. They should also be driven carefully to avoid the necessity of frequent withdrawals.

Preparatory to clinching, a slight notch only may be made under each nail. A deep furrow with the rasp along the row of nails, as is the common practice, is very objectionable. After the nails have been driven up and clinched, any roughness may be removed with a file, but the surface of the hoof wall, even below the clinches, should not be touched with the rasp.

Too much importance cannot be given to the preservation of the tough surface horn; and let me here repeat that, except to shorten the over-grown wall and prepare a suitable bearing surface for the shoe, no rasping or paring is usually required, and under ordinary circumstances should not be allowed.

Farm Topics.

CORRESPONDENTS' VIEWS.

MRS. FISHER's California letters are interesting, but I think she places too much confidence in the statements of strangers simply because they are very polite. My experience teaches me that many Californians are prone to put the best side ahead, to give single exceptional cases as general results, and to say many wide things in order to make newspaper people paint the best side of California. In Transcontinental Letters LXIV, I notice an error as regards wine making. Mrs. F. says; "Good, new wine costs about 75 cents a gallon. Vineyardists receive $18 to $22 a ton for grapes; and it is conceded that if a man gets 15 cents a gallon for his grape juice, he makes about $500 per acre off his land."

Figuring on this gives some surprising results. In Sonoma County Cal., the average yield is about six tons of grapes and about 140 gallons of wine per ton, or say 840 gallons of wine per acre. Now, to make $500 per acre at 15 cents per gallon, the yield would have to be 3,333 gallons of wine per acre. There may be a few exceptional acres that yield that much in extra seasons, but the average yield will not be one-fourth that amount. Again, if vineyardists receive $500 per acre when selling grape juice at 15 cents a gallon, and we calculate a fair yield at six tons of grapes per acre, and the weight of a gallon of wine is 8½ pounds, then we find that 8¾ pounds of grapes must make 8½ pounds of wine. If "good wine sells for 75 cents per gallon" and at 15 cents a gallon the product of an acre would be $500, at 75 cents it would be $2,500. It will be readily seen from this that many of these California statements will look worse for an investigation. E. REICHENBACH.

Wayne, Ohio,

I HAD 60 bushels of wheat per acre last year. One field of nine acres has not been manured for several years. It was very light sand, plowed three times, packed firm with harrow and leveler at least four weeks before sowing, and sowed about one inch deep one-and-a-half bushel per acre. This gave me a new idea, viz.: have the ground firm and sow shallow. I claim that little things like this are of more importance to us than a close study of nitrogen, ammonia, etc. [Perhaps so, and yet "nitrogen, ammonia, etc.," make the basis of all good farming. Somebody must study them.—EDS.] A. A.

Kelso, Ontario.

MY premium—the R. B. C. corn-sheller—came all right. I must say that I am more than pleased with it. I never saw one like it before. It simply works like a charm and is far ahead of anything in the corn-sheller line I ever saw. Long live the man who invented it, say I. L. L. COE.

Catharine, N. Y.

I HAVE a white dent corn that originated with me five years ago; it will mature in 80 to 85 days. This season a trial plot was planted on June 16, and matured Sept. 1st.

Eatontown, N. J. J. B. J.

Field Crops.

TOBACCO CULTURE IN CONNECTICUT.

Tobacco, the money crop; growing sets; fertilizing the bed; setting out plants; culture; harvesting; handling; a precarious crop.

THIS is the season for harvesting tobacco. The loads of plants on their way to the shed where they are to hang for curing emit an odor less fragrant than the spices of Araby; but, like many other disagreeable things, the odor is tolerated in view of the profit of the crop, for it is really the only one raised in this vicinity that directly produces money. In sight from where I write is a field of five acres the growth of which I have, during the past two months, watched with interest. It is owned and worked by Mr. F. B. Strickland, who is admitted to be one of the most successful tobacco growers in Hartford County. I have taken some pains to inquire into his methods and will give the result to the readers of the RURAL.

Seed is grown in a hot-bed in time for the plants to grow large enough to set by the first of June, or earlier if the weather is such that the ground can be properly prepared. Contrary to general practice, he prefers to raise successive crops on the same ground, that now growing being the eleventh. The ground is plowed deeply, and a goodly quantity of fertilizer is covered; then ridges running north and south are made three-and-a-half feet apart by turning deep furrows together. Before these are turned, he applies a goodly quantity of stable manure, castor pomace or tobacco stems on the surface to be directly below the plant when set and ready to furnish food for which the roots will soon make a start. It is not well to give the young plants a too vigorous growth by the application of fertilizers to the hill, but when established they will assimilate to advantage a large amount of food that should be within ready reach. He prefers to start root growth first. This done, that of the leaf will readily follow.

Plants are set 18 inches apart in the row if the variety is Havana or Spanish, or a little further if seed leaf. This crop is Spanish, which is now generally preferred here, as it gives a finer leaf and commands a larger price, although the quantity that can be raised on an acre is less than when the seed leaf is grown. Great care is taken to set the plants properly, for a plant well set is far on the way to perfect growth. Mr. Strickland never lets his work drive him. His land is made ready as early as possible, and he prevents it from becoming weedy by stirring it before the weeds appear, and takes the worms off before they have time to eat the leaves full of holes. He tops low, believing it better to have the same weight in fewer leaves, and that a few good leaves are of greater value than more poor ones. When the suckers appear they are taken off in a hurry lest they take strength from the leaves. He says it is more profitable to pay three men for one day's work each than one man for three days, because the work can in that way be done when it is needed. In harvesting he pursues the same plan.

When an acre is ripe it is cut and hung in the field on hooks put on the sides of lath alternately. On lath four feet long six plants are hung. From the field it is taken on proper racks to the drying shed, where it is hung to dry and cure under daily inspection, to see that there is nothing wanting to aid it in these changes. So it will hang until some favorable day in Winter, when the atmosphere is sufficiently charged with moisture to change it from its dry, brittle condition to one where it is pliant and can be handled without harm. Then, holding the butt of a stalk in the left hand, the leaves are rapidly stripped off with the right, and when a handful of good leaves is obtained they are bound together by winding a leaf about their larger ends, when the bundle, or "hand," as it is called, is ready to be laid aside to be packed in boxes or cases holding from 250 to 300 pounds each. In these cases it undergoes a sweating process that if successfully accomplished gives the leaves a fine silken texture of the desired color.

When stripping, the leaves are divided into two classes—firsts and seconds, or wrappers and fillers—and the sensible man does not endeavor to put with the "firsts" any that do not really belong there, knowing that a little inferior will lessen the price of the whole. For the same reason he rejects entirely some of the poorest fillers rather than have them lower the average of the rest.

But tobacco culture is hazardous business at best. There is not a day from the time the seed is sown until the crop is sold and paid for that there is not more or less risk. Sometimes the plants fail to get a good start in the seed-bed. When set in a dry time their growth is checked. Then the grub or cut-worm attacks them with vigor, and when he is subdued the tobacco worm requires combating. In later days a drought is injurious, and too much rain is not much better, especially in low land, for a tobacco plant whose roots are covered with water 24 hours is spoiled. Heavy winds blow over the stalks and whip the leaves into strings; and even a moderate hail storm is entire destruction. But a crop well raised, well cured and well sold is profitable.

Bloomfield, Ct. L. A. ROBERTS.

POTATO SPORTS.

IN digging a field of Pearl of Savoy Potatoes (Early Rose type) my workmen found several hills of Beauty of Hebron, evidently the product of a single tuber, that got into the lot of seed some way. Two of these hills contained well marked Beauty of Hebrons, while several contained rose-colored and white potatoes instead of light flesh-colored and white—*i. e.*, where the Hebron should have been light flesh-colored, it is red like the Pearl of Savoy, and one of these latter hills contained one handsome, smooth tuber, that is about equally divided from stem end to seed end, one half being a finely marked Beauty of Hebron and the other half rather dark red for Pearl of Savoy. Each kind runs the whole length of the tuber and the dividing line is very distinct. G. W. P. J.

Caribou, Maine.

[Such "sports" are not rare. Climate or soil or both often change the color of potatoes. During the past season a Rural seedling in rich garden soil was solid pink. In a sandy soil within a quarter of a mile, it is streaked buff and pink—sometimes buff. Our friend will find that by planting eyes of the pink parts, he will in a few seasons succeed in fixing a pink-skinned variety.—EDS.]

WHAT ABOUT THE POTATO CROP?

WE want to know all we can about the potato crop. Potato men in New York State should tell us about the potatoes there. Mine go about 100 bushels to the acre. They never rot in this sandy soil. They bring about 40 cents a bushel in White Pigeon. The potato dealers here have things fixed so that they can give just about what they like. For that reason we want to know whether there is much rot in the East. If there is, we can hold our crop to better advantage. T. T.

White Pigeon, Mich.

DRILLING AND HARVESTING CORN.

I PLANTED my corn this year in drills instead of hills and can now report results. Although it was sowed with an ordinary wheat drill which did the work only poorly, and in spite of the succeeding drought which caused it to come up very unevenly, it has matured a very satisfactory crop. I am well pleased with this method of planting. But two things are requisite to insure the greatest success. A good planter is needed so that the corn shall be evenly distributed, and then the smoothing harrow should be put over the ground at least once a week for the first five or six weeks. This thoroughly destroys all weeds when small, and renders the use of a hoe superfluous except to cut up thistles or other perennial weeds.

There can be but one objection raised to drill planting of corn, when treated as above described, and that is the increased labor of cutting. This can be entirely obviated by cutting it with a self-raking reaper, which will do it easily, putting it in fine shape for binding, if only a single row is taken at a time. By letting the corn lie one day in the gavel before binding, it will be so wilted that any stalk will answer as a binder.

When corn is so cut and bound in bundles and these are set into rather large shocks, it cures out nicely and is in the best possible shape for hauling into the barn or shed for husking. And by using the reaper it can be cut, bound and placed in shocks with less than half the labor of cutting by hand and standing in the ordinary stook. There are many things yet to be learned in farming.

HARVESTING ROOT CROPS.

UNLESS everything is ready for the root harvest, no time should be lost, as in this lati-

tude it is not safe to leave beets and mangels out after October 15. Any frost severe enough to freeze the skin causes them to peel easily and to rot more or less in bins or pits when stored—carrots, turnips, etc., can be safely left till later.

If the beets or mangels do happen to get frosted, unless so much frozen as to be killed, or unless severer frosts are feared, it is best to leave them standing for a few days until growth is resumed, as in that case the damage is in a great measure remedied by the healing up of the frozen surfaces, and they will keep much better when stored. J. S. WOODWARD.

Niagara Co., N. Y.

Floricultural.

BULBS IN THE HOUSE.

E. L. TAPLIN.

Treatment of hyacinths so as to secure flowers for the holidays; water culture preferred; single varieties better than double; avoid cheap, mixed sorts; moss culture; the best kinds of tulips; window boxes; snowdrops, Lily of the Valley, Easter Lilies, anemones, ixias, freesias, etc.

MANY amateur growers who admire the beauty of hyacinths and others of this class are not aware how readily they may be grown indoors, so as to secure abundant flowers about the holidays with a very small expenditure of trouble. I should always recommend growing hyacinths in water, since the system has the dual advantage of ease and cleanliness. There is no danger of mud or uncleanly drippings, and the glasses are much more sightly than ordinary flower pots. For this plan you must obtain regular hyacinth glasses, which hold the bulb nicely in place. Always use rain water, and put a few lumps of charcoal in the bottom to keep the water sweet. Start the plants about the first of October. Do not fill with water above the bottom of the bulb. Put in a dark place until the roots reach the bottom of the glass; this will probably be in about three weeks. As the water evaporates fill the vessel up, but only until it barely touches the bulb. When they begin to grow they require plenty of light, but it is not well to stand them in a window where they get the hottest noonday sun, as this often heats the water until the bulbs are almost cooked. It is also a mistake to set them directly on the window sill, as the draft at their base is soon felt.

We must warn flower lovers that the hyacinth only blooms *once* in perfection. It may bloom year after year, but the flowers grow poorer and more dege erate every season. In the Dutch bulb farms they are not allowed to flower, save in specimen beds, from the time the sets are planted until they are ready for market, in about the fourth year. The flower stem is cut off as soon as it grows, so that all the strength goes to the bulb. Outside they are not so much exhausted by blooming as inside. Forcing seems to entirely destroy the poor bulb's constitution.

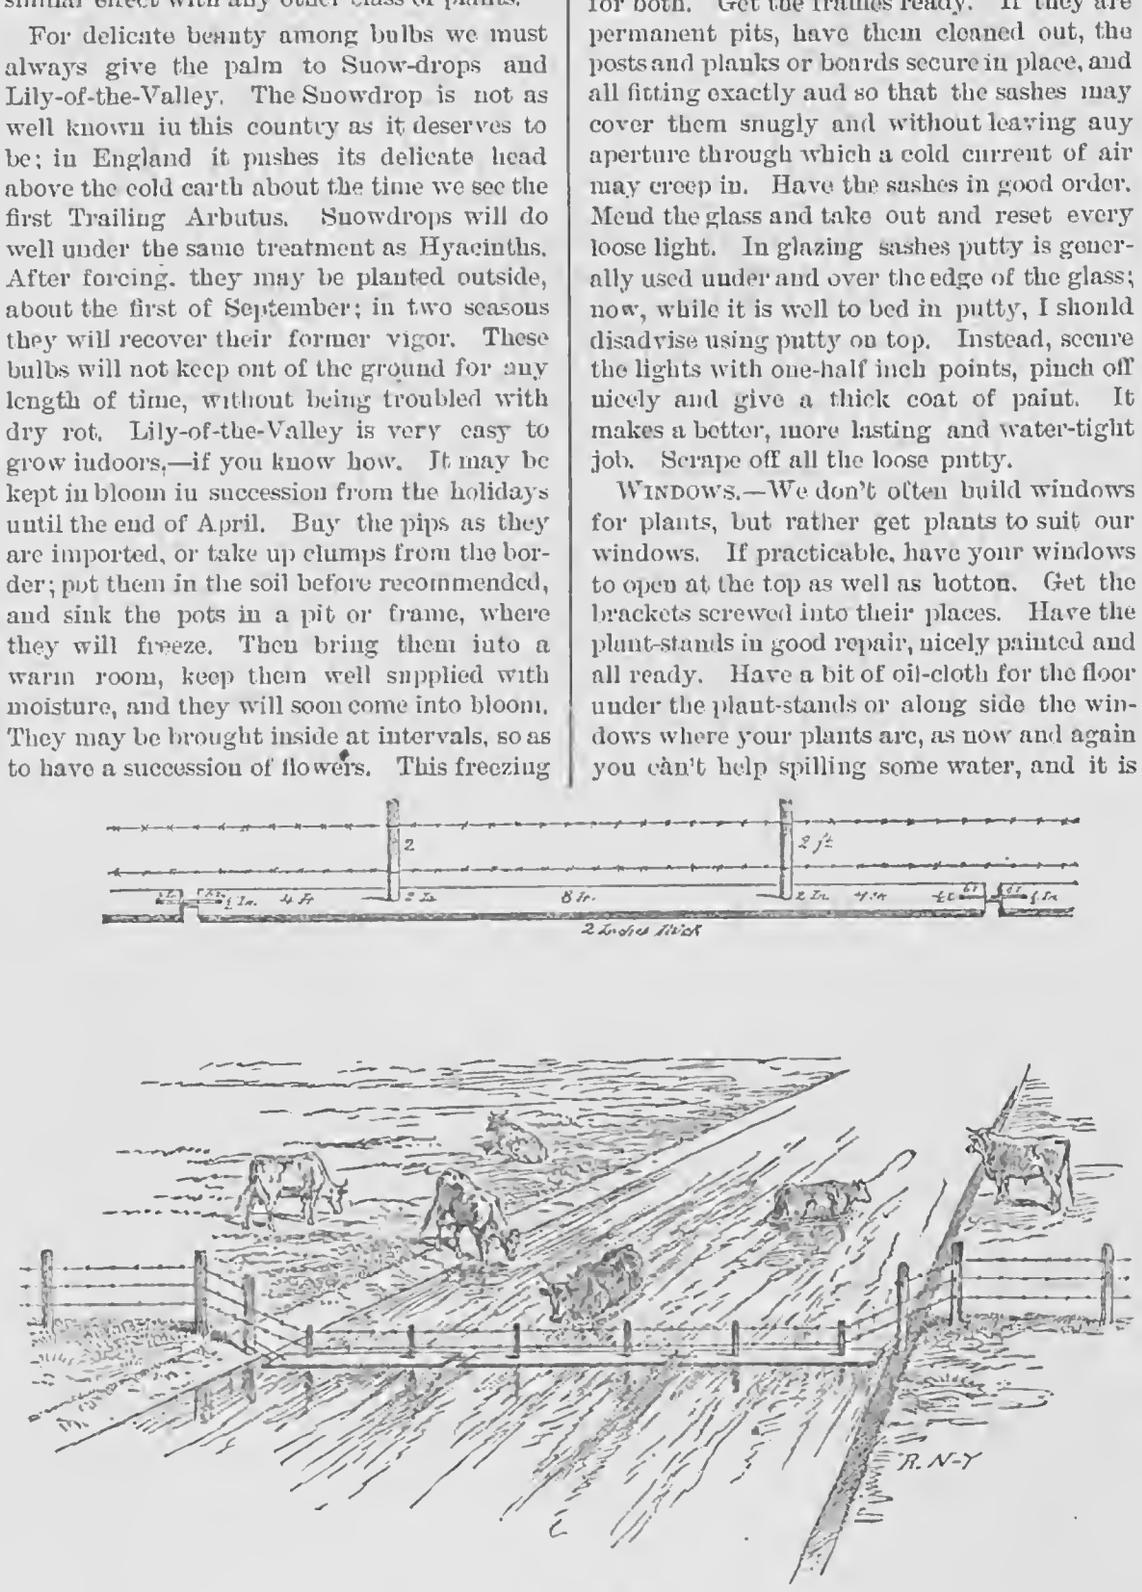
For indoor culture, single varieties are preferable; the double are apt to form flowers unevenly, and open irregularly. The best single white is that familiarly known as the Roman hyacinth, much grown for florists' use. The flowers are pearly white, and very fragrant; the spikes are small, but each bulb produces more than one. Purchasers of bulbs for window flowering must be cautioned against buying cheap, "mixed" sorts, as they are simply "culls." Chose the colors required, and buy named bulbs from a reliable seedsman. Another good plan for growing them in glasses, is to put the bulbs into clean sand until the roots are about six inches long; then take them out and put them into the water. The great attraction about growing them in water is the oddity; it is very interesting, especially to children, to watch the structure and daily growth of the roots.

Any flowering bulb will grow nicely in damp moss; if packed in the Dumesnil fertilizing moss the result is surprisingly fine. Again, a dish or vase may be half filled with clean sand, the bulbs placed on this, and the vessel filled up with fresh green moss. Nothing is handsomer or more showy than large pots or boxes containing mixed bulbs, hyacinths, tulips and crocuses. To flower successfully, they should be potted early in September, in soil containing equal parts of good loam, leaf mold, and well-rotted manure, which should afterwards be mixed with about one-fifth of pure sand. After planting, the pots should be plunged into a pit or open border, and covered with four inches of soil, there to remain until about the first of December. Then they may be brought in as wanted, and forced into flower It is always highly important that the roots should be well grown, before the leaves start to any great extent. Of tulips, the scarlet, crimson and white Duc van Thol will be found most satisfactory. They are single flowers; Tournesol is a very showy double red and yellow. Cottage Maid is a very fine pink; large and showy, yet delicate in appearance. The crocus is always charming, whether yellow, purple or white.

A window-box, filled with different varieties of bulbs, is extremely pretty, and has a spring-time suggestiveness all its own in the depths of Winter. It is impossible to obtain a similar effect with any other class of plants.

For delicate beauty among bulbs we must always give the palm to Snow-drops and Lily-of-the-Valley. The Snowdrop is not as well known in this country as it deserves to be; in England it pushes its delicate head above the cold earth about the time we see the first Trailing Arbutus. Snowdrops will do well under the same treatment as Hyacinths. After forcing, they may be planted outside, about the first of September; in two seasons they will recover their former vigor. These bulbs will not keep out of the ground for any length of time, without being troubled with dry rot. Lily-of-the-Valley is very easy to grow indoors,—if you know how. It may be kept in bloom in succession from the holidays until the end of April. Buy the pips as they are imported, or take up clumps from the border; pot them in the soil before recommended, and sink the pots in a pit or frame, where they will freeze. Then bring them into a warm room, keep them well supplied with moisture, and they will soon come into bloom. They may be brought inside at intervals, so as to have a succession of flowers. This freezing process, similar to the treatment given Jack roses, deludes the poor plant into the idea, when brought indoors, that the Winter is over, and it blossoms in consequence of this deception.

The Easter Lilies—(L. candidum and L. longiflorum) may be flowered indoors by potting early in November, and supplying them with plenty of warmth and water. Tuberose, too, will do well under similar circumstances, but it cannot be recommended, as the odor is extremely offensive to many. Ranunculi, anemones, and the various Cape bulbs, Ixia, Sparaxis, Freesia, etc., may be grown as house plants, and these bulbs offer a welcome change from the almost invariable geranium, callas, and so on, that are usually grown. They have the advantages of cleanly habits, easy culture, beauty and fragrance, and we hope to see them gaining in popularity from year to year.



FENCING STREAMS. Fig. 382.

WHAT TO DO AND HOW TO DO IT.

WILLIAM FALCONER.

THE GREENHOUSE.—Get it into thorough repair as soon as you can. Mend the glass. Use double-thick, clean glass; bed in putty, but don't use putty on top, and tack into place with one-half inch triangular points. Give the greenhouse a coat of paint. Paint is cheap enough, and you can do the painting yourself. Use the best white lead (I use Jewett's) and linseed oil. My experience with patent paints on greenhouses is that they peel off. I prefer white paint, because it is always at hand, whereas in colored paints we may not always have at hand the same shade of color. Paint preserves the wood against early decay, renders the glazing more water-tight, and gives the whole house a neat and clean appearance.

Fix and oil the ventilating gear, repair the staging and stop up every crack in the woodwork with putty. Inside the house wash the woodwork, glass, staging and walls with crude or kerosene oil, or in the case of the walls, whitewash them with hot lime-wash. This destroys insect vermin and their eggs. Clean the chimney vent, clear out the soot boxes and around the boiler, and give the inside of the furnace and corrugations of the boiler a thorough cleaning out. If the furnace grating is broken, unduly warped, or won't turn over, have it seen to at once, for after you begin firing is no time to stop and attend to these matters.

COLD-FRAMES AND HOT-BEDS.—Now is the time for cold-frames, the Spring for hot-beds, but the same frame-pits and sashes are available for both. Get the frames ready. If they are permanent pits, have them cleaned out, the posts and planks or boards secure in place, and all fitting exactly and so that the sashes may cover them snugly and without leaving any aperture through which a cold current of air may creep in. Have the sashes in good order. Mend the glass and take out and reset every loose light. In glazing sashes putty is generally used under and over the edge of the glass; now, while it is well to bed in putty, I should disadvise using putty on top. Instead, secure the lights with one-half inch points, pinch off nicely and give a thick coat of paint. It makes a better, more lasting and water-tight job. Scrape off all the loose putty.

WINDOWS.—We don't often build windows for plants, but rather get plants to suit our windows. If practicable, have your windows to open at the top as well as bottom. Get the brackets screwed into their places. Have the plant-stands in good repair, nicely painted and all ready. Have a bit of oil-cloth for the floor under the plant-stands or along side the windows where your plants are, as now and again you can't help spilling some water, and it is easier to wipe up the water off the oil-cloth than off the carpet.

Don't bring your plants inside into your windows as long as you can safely have them out-of-doors. We generally have some beautiful bright weather in October, cool at night, but warm in the day-time. Let the plants have the benefit of the warm weather, but cover them up or bring them in upon the piazza in the event of cold or wet weather. Toward the end of the month, it may be well to house most of your tender plants.

THE PIAZZA.—The piazza is a capital place for pot plants in October. All plants that are established in their pots can enjoy the south side, and those newly potted the shady side. If the plants are standing outside on the walks, in the event of frost, or a windy or wet storm, in a few minutes we can lift them on to the piazza where they will be safe, or if need be, by the aid of some old newspapers or a sheet or two we can make them doubly secure.

POTS.—I don't care what they are—glazed or unglazed earthenware, tin cans or wooden boxes—providing they have a large-sized hole in the bottom for drainage. But there is nothing better than the common flower pot. I prefer the common shapes or sizes because in repotting plants I can shift from one sized pot to another without intefering with the ball of the roots, whereas were the pots of uncommon shapes, I'd have to suit the ball of roots to the pots into which I was about to plant them. And I prefer pretty hard pots to the trashy things that crumble to pieces if they get the least rough handling when they are wet.

SOIL.—There is, I think, a good deal of twaddle written about different kinds of soils for different plants. I use sod loam and well rotted manure for almost everything. For callas I use the roughest part; for azaleas have less manure and some leaf soil: for common ferns not much manure but a good deal of leaf soil and chopped swamp moss; for roses the strongest clay loam I can get; for cactuses rather gritty loam; and so on. Gross feeders get the richest soil. In the soil for stevias, marguerites, nasturtiums and other heavy-rooting plants I add a good sprinkling of finely broken bones—such as we feed to chickens,—and for carnations, a good dusting of lime. Never use soil when it is wet, or manure that is pasty. Break up fine the clay lumps, but not so the bits of fibrous sod. Pick out and throw away all the grubs and worms you find in the soil.

POTTING PLANTS.—Don't use dirty pots; have them clean in the inside anyway, else in repotting, rather than turn out in a clean ball the outside roots will tear off and stick to the sides of the pot. And never use wet pots. Never use a big pot for a little plant, but rather use the smallest pots into which you can conveniently get the roots, no matter how big the plants may be. Always drain your pots well. Put a biggish piece of crock over the hole, then a lot of smaller ones over that, and some half-rotted leaves, dry chaffy manure, or bits of sod with the earth pretty well shaken out of them over the drainage to keep it clean and prevent its being clogged up with the soil. In draining pots I use broken pots, broken brickbats, broken mortar or cement from old buildings, coal ashes from which the finest part has been sifted; in fact, almost anything. Use moderately dry soil, introduce nicely among the roots, pack firmly, and fill up to within one-half or one inch of the brim of the pot.

LIFTING PLANTS.—I would sooner lift them in dry weather and when the ground is dry than in moist weather or when the ground is damp. When lifted with large balls we cannot put the whole ball into a pot, and if the ground is moist, in reducing the ball the rootlets are brittle and apt to drop off with the earth; when the ground is dry the rootlets are less brittle and the earth can be shaken away from the roots with less likelihood of injuring them. Get all the roots you can, no matter if you don't secure much earth with them. In the case of heavy clay ground we had better moisten it the day before we lift the plants, else it will be so lumpy that we cannot reduce the lumps without breaking off many of the roots.

WHAT PLANTS TO LIFT.—All that are planted out and which we wish for winter flowering, also all tender plants we wish to keep over Winter for next year's garden. And the sooner we lift them the better so that they may get fairly well rooted in their pots before the dull, cold weather of Winter sets in. Pot them as you lift them, water them through a water-pot rose when you pot them, and stand them in a sheltered, shady place for a few days till they recover the check. Sprinkle them overhead two or three times a day, if need be, for a few days to prevent them from wilting.

Farm Economy.

FENCING STREAMS.

MR. J. H. WOODBURN sends us the design illustrated at Fig. 382. But little explanation will be needed. The idea is to take 2x6x16 pine stuff, bore holes one-half inch in diameter, six inches from each end; also four feet from the end bore other holes two inches in diameter and drive in post two feet high, and fasten firmly. Prepare as many of these as will cross the water; wire them together end to end through the small holes, allowing some play, posts upright; then attach two strands of barbed wire to the short posts in the usual way; float this across on line of fence; attach to the fences on either side, drawing the wires tight. This will rise and fall with the water. Nothing will cross it, and when cold weather comes, loosen one end, draw out on the bank along the other fence, out of the way.

Pomological.

ABOUT DISTANT FRUIT MARKETS.

PRES. PARKER EARLE.

Increase of fruit growing for distant markets; magnitude of the trade; three great improvements; losses from bad packing and packages; instances; faulty transportation; refrigerator cars needed; losses from lack of them; better distribution needed.

ONE who travels over this country, or in any way becomes acquainted with the operations of our fruit growers in all these districts where fruit growing for market has become a principal business, will very soon see that in all the distinctively fruit-growing regions, these crops are grown for *distant* markets. This is a business that has largely grown up within the last 25 or 30 years. Before this period the means of transportation were limited. Markets were limited, and in fact the whole sys-

tem of fruit production on the immense scale which it has now reached, was in its infancy. The orchards and the vineyards had not been planted, and the varieties of small fruits now mostly grown had not been originated. But within a dozen years the business of growing fruits for market has reached a great magnitude in many sections of the country. And most of this fruit is intended for *distant* markets, a comparatively small amount being sold in towns near the place of production. For instance, California exports to the Eastern States nearly 4,000 car-loads of the various fruits in a season. The Florida orange crop is estimated at nearly a million boxes annually, which is about 4,000 car-loads again. The quantity of strawberries marketed yearly in one of our great markets—Chicago—amounts to over 1,500 car-loads. New York probably receives a larger quantity, and other cities proportionate amounts. The peach crop of the Delaware Peninsula fills five or six thousand cars. And so without attempting to compute the apple crop, which we all know reaches vast figures yearly, or the grape and other important crops grown so largely for distant markets, we see something of the magnitude of the interests involved in this question.

How many millions of dollars are invested in commercial fruit growing in this country, and how many more millions are used in handling these crops every year, no one can tell; but it has become one of the large industries of the time, and the number of people who make their living in the production and handling of the American fruit crops reaches hundreds of thousands. Hence anything that can contribute to the successful outcome of this industry is of importance to the country. Perhaps no one who is familiar with fruit markets will question that there is great room for improvement in our methods of handling fruits in three important particulars—in better packing, in better packages and in better cars for transportation. I have heard it estimated by dealers that fully one half of all the fruits sent to market were so badly packed or so badly carried as to pay little if any profit to the grower. My own observation leads me to think this a moderate opinion. If this is correct it shows that one-half of all the labor and capital invested in fruit growing in this country is wasted, and this because of defects in our system of doing business, which can be cured.

Let us look at some facts. I have seen hundreds of bushels of strawberries arrive in one of our Northern cities, where not one package could be found in good sound condition for use or reshipping, simply because of the style of package used—old-fashioned Western "stand of drawers," being wholly unsuited to the long carriage of delicate fruits. The berries referred to were large, well grown and well picked, but were practically thrown away in these wretched half-bushel drawers, nearly every berry in every drawer arriving bruised and bleeding from a journey of about 300 miles. If picked and sent in nice quart boxes or baskets, they would have borne such a journey with little damage. And yet this folly of using such ruinous packages is repeated year after year, with similar results. There is a large district in this country where berries are grown for distant markets on a large scale, where all the profit that should be possible from well grown strawberry crops appears to be thrown away in marketing in such clumsy packages. The remedy in this case is cheap, near at hand and "easy to take."

Again, a very large portion of the strawberries grown in the South for Northern shipment, although put up in suitable packages, fails to reach the markets 1,000 miles or more away, not because of the distance or the time consumed, but because of rough usage by transportation companies, or the inevitable heating which results from piling large amounts of fresh fruit in close, hot cars. In this case it is the transportation that should be improved. Different cars are needed. Strawberries can be successfully shipped long distances—a thousand miles, even two thousand miles if need be, for this is done every year. But they must be kept cool all the time. Strawberries will last several days in fine condition in a temperature of 50 degrees, and keep well enough to be marketed when exposed to a higher temperature afterwards; while the same berries will hardly survive a day's journey in cars that subject them to our summer heat. The distant marketing of berries requires the best of modern packages, and cool, or so-called refrigerator transportation. With the best appliances of this kind, the most distant markets can be safely reached, and disastrous gluts measurably avoided. This conclusion is based upon my own experience running through a number of years.

A friend of mine, an orange grower in South Florida, last Winter sent the product of his grove to market after the freeze when prices were high. He got the best cars he could, which were common freight cars, packed with great care to prevent freezing up in transit, and awaited results. His two cars were detained by high water at the Ohio River; a cold wave came, his oranges were frozen solid, and before reaching market had thawed out and heated, and with the juice running from most of the boxes they did not pay freight. There were $2,000 thrown away for lack of a good refrigerator car that would protect its load equally against cold and heat. Dealers tell me that so large a proportion of the Florida orange crop suffers from frost or from heat during the winter journey, that it renders the crop a treacherous one to handle and heavy losses are liable to occur. The orange is a good-keeping fruit, and with a system of handling and transportation adapted to its needs, it can be placed in the remotest markets of the country with safety and profit to all concerned. I am told that there were many sad homes in Florida last Winter when the returns from Northern markets were received, for crops in which all the hopes for a year's living were centered, and all or mainly because of the crude and imperfect means of transportation for this great golden harvest of our romantic, sub-tropical State; and yet Florida oranges were not low-priced to the consumer last Winter.

Space forbids any expansion of this argument. Let me say, briefly, that we are not producing too much good fruit, but we are putting half of it into market in so poor a condition as to be unprofitable; and we fail in our system of distribution. Concerning this I may write again.

Cobden, Ill.

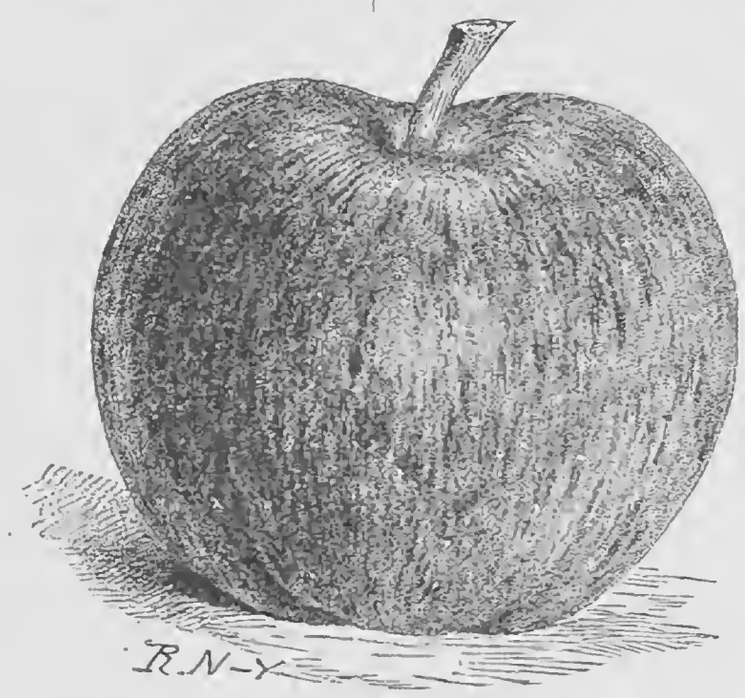
POPOFF'S STREAKED APPLE.

THIS apple (No. 247 of the Department List of 1870), cions of which I received from Mr. A. Webster, of Roxbury, Vt., a few years ago, has produced some fruit this season, and I wish to call attention to it as an apple of great beauty and high quality for dessert. It is true that there are many other good apples of the same season (Sept. here), but this is so particularly and peculiarly good and pretty that it should certainly be placed on the amateur list of iron-clads. It is of medium size, roundish-oblate, with small cavity and basin, short stem and small, closed calyx. In ground color it is ivory-white, when ripe, but nearly covered with fine, rosy-carmine stripes, spots and splashes, without dots of any kind. The flesh is as white as that of Fameuse, but partially stained with the same rosy-carmine as the surface. The texture is fine, tender and delicate in the extreme, even more so than the best Fameuse, and the flavor not high, but sprightly and delicate, with a slight acid and just a suspicion of sweet, certainly very good. This does not agree at all with the description given by Mr. Gibb, from Dr. Regel in 9th Mont. Hort. Soc.'s Rept., p. 82, but is more like "Rosy," No. 274, p. 85, yet not agreeing in season. I make this report as a contribution towards fixing the description and nomenclature of Russian apples, which is in such confusion. T. H. HOSKINS.

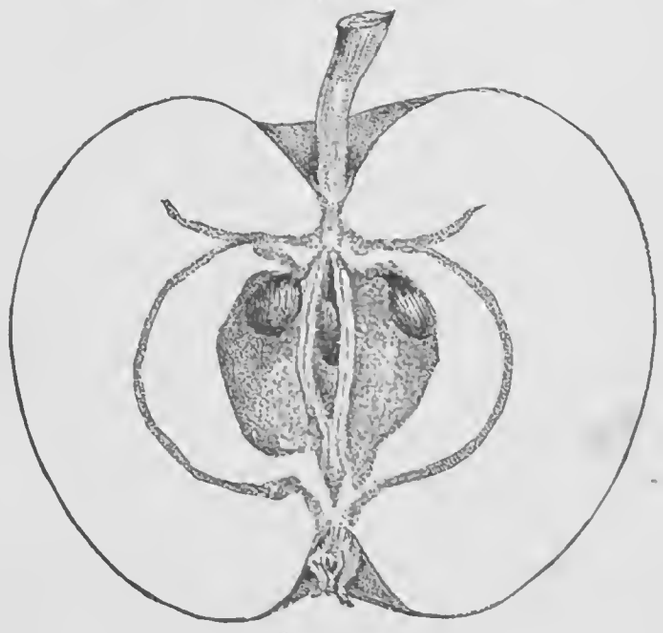
Newport, Vt.

ST. PETER'S APPLE.

ON August 25, Dr. T. H. Hoskins, of Newport, Vermont, sent to this office specimens of the above apple, and said: "The St. Peter's apple (shown at Fig. 383, with cross-section at 384) is one of the Department of Agriculture's importations from Russia in 1869–70, which is becoming very popular in the "cold North," under the name of the Russian Early Joe. It is an iron-clad, an early and profuse bearer and a very thrifty tree. Its quality, when ripened on the tree, is "very good," and it must rank among the dessert apples of this class. It is, I think, about as good as the Yellow Transparent, and almost exactly of the same season. It is, however, much smaller than that apple. It has the advantage in its red color, though the ivory white of the Transparent is quite pleasing enough to excite appetite. I am now marketing quite a large crop of the latter at $1 a bushel."



ST. PETER'S APPLE. From Nature. Fig. 383.



ST. PETER'S APPLE. Cross Section. Fig. 384.

Horticultural.

THE CRYSTAL WHITE BLACKBERRY.

THIS originated in Illinois. By whom or when we know not. We received our plants from J. T. Lovett, of New Jersey, in May of last year. They have made a strong growth and have borne a few fruit this season, of which the illustration, Fig. 385, is as true to nature as our artist could make it. The canes and leaves are of a lighter green than those of other kinds of blackberries, the leaflets much narrower, as shown. This variety is said to be somewhat tender and not very productive. The plants were not seriously injured at the Rural Grounds by the past Winter. As to productiveness, we cannot as yet speak. The berries are of a translucent, dull white, sweet and tender.

Why give space for an illustration and description of a fruit that has so little to recommend it? Oh, we like curious things. They give the charm of variety to the country home; to the children; to our friends and visitors. Those who plant, arrange, study and live only with an eye to profit are blind in the other eye and can't see or experience half of life's pleasures.

What Others Say.

KEEPING BUTTER IN BRINE.—Those who prefer freshly made butter, but cannot always obtain a supply, says the New England Farmer, have sometimes attempted to keep roll butter fresh by immersing it in a strong brine, supposing that it would thus escape the disagreeable woody taste of butter packed solid in tubs; but in most cases such experiments have been anything but satisfactory. The difficulty still remains, because the wood flavor is taken up by the brine and imparted to the butter. The Live Stock Journal gives the following directions for preparing tubs or casks for keeping butter in brine:

"Make a saturated brine of the purest salt you can get, using a pound of saltpetre to about 20 pounds of salt. Scald the brine by bringing it to a boiling heat, skim, and apply when sufficiently cool. The casks should be carefully prepared, as well as the brine. If the gum and sap in the wood are not removed before the casks are used, they will work out into the brine and affect the butter. To remove the woody flavor from the casks a thorough steaming with a high pressure is the quickest and best means. If soaked before the steam is applied, hot steam will cut the gum and woody flavor all out in a short time. If steam is not convenient, soak in brine till the wood is saturated. Then fill with boiling-hot brine, and let it stand until it gets cold, when the woody flavor will be sufficiently removed. By keeping the butter under the brine and the cask in a cool place, the butter will keep safely."

Mr. T. S. Gold, who keeps a large herd of cows for the sale of milk, and has a large family table to supply, has for many years made his surplus milk into butter and preserved it in four-pound rolls wrapped in cloth and immersed in casks of brine. He thus avoids overcrowding the milk market in flush periods, and the purchasing of butter for family use in the season of high prices. The wrappers should be well confined around the roll to prevent bits of butter from separating and floating on the surface, and the whole must be kept under brine constantly, for the smallest piece exposed would soon spoil the brine and thus all its contents.

Mr Cheever approves of this method if one can do no better. But he has never yet seen any preserved butter that is quite equal to that which is freshly made, that is, butter not over one week old.

FINALLY.

MR. THOMAS MEEHAN says that where he sees a farmer who has no love for the beautiful, for flowers, for home comforts, and pleasant surroundings, he usually finds no happiness, and an unworthy member of society. He is not prepared to say that such are always the inevitable results, but the tendencies are in that direction.....

MR. GIBB mentions in the last report of the Montreal Hort. Society that the Yellow-wood (Cladrastis tinctoria, too often printed Cladastis) has thus far proven hardy with him (Abbortsford, P. Q., Canada). He thinks it one of the finest of the American flowering trees.

HE commends the Tulip Tree (Liriodendron tulipifera) for trial in sheltered city gardens. But it is certainly the last tree we should select for such a little place. It is too large for the street or lawn, not to speak of a "city garden."

MR. GIBB pleases us when he says that the landed "Russian Mulberry" has been sold at an outrageous price. Our readers know that we planted this tree at the Rural Grounds when it was first talked of, and condemned it as not of any special value. The best kinds of the Russian Mulberry produce fruit inferior to the Downing, and are valuable only as the trees are hardier. These should be propagated from cuttings—not from seed as has been the case with the kinds offered for sale. Of course, a large proportion are absolutely worthless, so far as the fruit is concerned.....

THE Russian Mulberry is worth not over 15 cents a tree. It has been sold at prices varying from one to two dollars.....

MR. GIBB says that the new Phellodendron Amurense is not hardy in Canada. It is entirely hardy at the Rural Grounds. In general appearance it might be called an improved ailanthus.....

MR. GIBB finds the curiously beautiful Ginkgo Tree (Salisburia adiantifolia) nearly hardy with him. It is certainly worthy of a high place among all collections of any pretentious whatever.....

A LATE bulletin of the Michigan Agricultural College says that Clawson Wheat yielded 18¾ bushels per acre on eight acres. It produced "a heavy growth of straw which lodged badly and gave a shrunken, poor quality of grain.....

ROGERS'S Amber yielded 26½ bushels per

acre on six acres. The straw was stiff, of medium length, stood up well. This variety is hardy.....

FOUR acres were sown to Martin's Amber with different amounts of seed:

First acre, 45 pounds (¾ bu.) of seed. Yield, 21 bu.
Second acre, 60 pounds (1 bu.) seed. Yield, 24½ bu.
Third acre, sown with 75 lbs. (1¼ bu.) Yield, 26½ bu.
Fourth acre, sown with 90 lbs. (1½ bu.) Yield, 26 bu....

FIVE and a half acres were sown to Champion Amber with 7¾ bushels of seed. The yield was 33 bushels to the acre. This kind has proven hardy for three years. Straw strong and of medium length. Heads medium size, smooth, white chaff.....

E. W. STEWART says, in his book on Cattle Feeding, that many flocks of poultry may be found that will not eat potatoes or barley or rye or millet or buckwheat, simply because they never learned to eat these foods. Yet they are all good foods for poultry, provided they are given in due proportion, having regard to the several food elements they contain.....

IF manure at 50 cents a ton is less profitable than clover, what may those farmers think who are paying $2 to $3 per ton for manure, is a question propounded by Henry Stewart. The cheapness of clover and its far greater value as compared with manure render it especially beneficial for farmers who grow grain, and for them the practice of growing it to plow under is most useful.....

EVERY person knows, says Mr. Stewart, how moist substances, as wood, flour, flesh, grass, etc., when kept in a warm place, decay in a short time and become entirely decomposed, but how long they may be kept in perfect condition when kept dry and cold. It is the same with manure, which decays most rapidly when kept moist and warm. But when exposed to water for a short time and then dried, no matter how great the heat may be, manure will remain undecomposed. It is then, he concludes, a mistake to spread manure on the surface, but the best practice is to plow it under as soon as possible.....

A DEAD animal on the dry plains does not decompose, but dries up into a horn-like substance. Decaying organic matter evolves much carbonic acid and ammonia. When this matter is exposed to the sun's heat and to the dry winds, and the moisture in it is evaporated, these gases escape into the air and are lost. And these are really the most valuable parts of the plant food which is contained in manure. But porous earth has the property of absorbing a very large amount of gaseous matter, and the soil takes up the escaping ammonia and carbonic acid and holds or changes them into other substances which the roots of plants can feed upon.....

IN a book of stable maxims appears the following very sensible advice, says our friend the Kansas Farmer: "When a horse shows signs of being very unwell, do not try remedies which you do not half understand for an illness you cannot determine".....

MR. P. BARRY, referring to the fact that great quantities of the English walnut or Maderia nut (Juglans regia) are annually imported and sold in this country, says that the tree with him (Rochester, N. Y.,) is tender while young, but becomes hardier as it grows older.....

THE Dwarf Prolific Walnut (Juglans præparturiens) is desirable for the garden, as it bears at the age of three years from the seed, and often at the hight of two or three feet...

EVERY garden ought to have a few filbert bushes. If the fence corners and hedges must have something growing in them, the filbert is as good as anything. As to varieties, the Cosford is an improved kind of the English. It is very productive, bearing a large nut with thin shell and a kernel of excellent flavor. The Coburg bears a large nut, and it is an abundant bearer. The Dwarf Prolific is perhaps as beautiful as any, though the nut is rather small.....

MR. BARRY says that of all the varieties of the Spanish chestnut, that called by the French *Marron de Lyon* is the best. It bears and ripens well as far north as Rochester, and it bears the second year from the graft and the fourth from seed.....

A GOOD plan in packing pears is to wrap each one in soft paper, packing closely enough to prevent all motion, in bushel boxes.....

THE French, who export more pears than any other nation, cover the inside of the boxes with spongy paper or dry moss, which absorbs the moisture. Each pear is then wrapped in soft paper and placed in layers in the boxes, the largest and least mature in the bottom, filling all interstices with the dry moss. Thus they will keep a month or more. They are so closely packed that though they can not touch each other, all motion is prevented. If one decays the others are not harmed.....

MR. BARRY mentions that some of the Paris dealers preserve fruits successfully packed in layers in barrels and the interstices filled up with charcoal. The barrels are kept in a dry, cool place, about 40 degrees, and not subjected to temperature changes. Apples, pears, grapes, almonds, nuts and potatoes are all preserved in this way.....

A GOOD selection of pears is this for standards: Bartlett, Clapp's Favorite, Doyenné Boussock, Sheldon, Paradise d'Automne, Seckel, Dana's Hovey, Anjou, Bose, Doyenné d'Eté.....

IF dwarfs are desired, try Anjou, Angouleme, Howell, Tyson, Giffard, Louise Bonne de Jersey, Urbaniste.....

THE RURAL would select, among apples, the following varieties for most of the Middle and Eastern States for a small collection:

SUMMER: Williams's Favorite, Primate, Early Strawberry, Red Astrachan.

AUTUMN: Gravenstein, Jefferis, Chenango Strawberry, Oldenburgh, Hawthornden, Porter, Stump, Lowell, Fall Pippin.

WINTER: Baldwin, Wagener, Roxbury, Russet, Northern Spy, Jonathan, Hubbardston Nonesuch, Famense, Red Canada, Pomme Grise, Peck's Pleasant, Yellow Bellflower....

IF we were about selecting a dozen kinds of grapes for what is usually designated an amateur's vineyard, we should include the following: Brighton, Delaware, Moore's Early, Vergennes, Worden, Jefferson, El Dorado, Elvira, Empire State, Hayes and Ulster.....

THE new Globe Peach is announced as having produced peaches 15 inches in circumference, which is hard to credit. It ripens with Crawford's Late. It is a good shipper, a freestone, and of the best quality.....

MR. A. W. CHEEVER, the experienced editor of the N. E. Farmer, says that Red-top grows as tall as Timothy and makes more stalks which give a finer quality of hay and more of it to the acre. It endures drought after cutting better than Timothy and is less injured by cattle—The Timothy being easily pulled by fall feeding. Red-top is a little later than Timothy and some object to sowing the two together. But there is not enough difference to cause much loss by either early or late cutting of the one to save the other at its best ..

MR. CHEEVER usually sows 15 to 18 pounds of Red-top, with 10 to 12 quarts of Timothy and six or eight pounds of Red Clover. Red-top seed ranges from two to three dollars per sack of 50 pounds, 10 pounds being reckoned to the bushel. Timothy was formerly the fancy hay for stable keepers in and around Boston, but in recent years Red-top has grown much in favor .. ..

To decide the question: "Does pinching the terminal shoots of potato tops increase the production of tubers?" the New York Ex. Sta. planted eight short rows of Vick's Early Gem Potato, May 2. The tubers were cut to single eyes. On June 22 the terminal shoots were pinched off of alternate rows. The flower buds were then just forming. The pinching of the same rows was repeated on July 16. At this time it was evident that the pinching had increased the number of branches above ground. August 28 the rows were dug and it was found that the pinching was positively detrimental to the yield of tubers.....

WRITING of Canada ashes, J. J. H. Gregory says that all ashes ought to be bought and sold on analysis. It is true a man may make a pretty near guess by tasting or by leaching a sample; but the test of a chemist, though a fool, can far surpass the best guess of the most experienced man. The result in one case is a certainty, in the other, at the best, an uncertainty. In dealing with some of the smooth-tongued fellows who have all the way to Canada between you and the facts, it is much easier to analyze the ashes than the men. Ashes have been sold as Canada unleached that proved on analysis to be nothing but oyster-shell lime and a little admixture of wood ashes.

DR. R. C. KEDSIE says that if trees are cut at any time after the leaves are fully developed and in most active growth, the branches and leaves being left on till the leaves completely wither and the bark is removed from the body of the tree, the best results will be secured for lasting timber. The leaves draw out much of the sap which contains the most fermentable substance in wood, and that which furnishes food for worms which prey on wood. By cutting off the branches and leaves as soon as the tree is cut down, the pumps are stopped which would nearly pump the tree dry .. ..

PROF. BUDD says as the united result of many trials, made under the direction of the Russian Government, it has been decided that the best time to cut trees was near the end of June while the bark would peel freely.....

OLIVER WENDELL HOLMES says that when one of us who has been led by native vanity or senseless flattery to think himself or herself possessed of talent arrives at the full and final conclusion that he or she is really dull, it is one of the most tranquilizing and blessed convictions that can enter a mortal's mind.....

Everywhere.

TRANSCONTINENTAL LETTERS.—LXVI.

MARY WAGER-FISHER.

Homeward bound; California at her best in March: the San Joaquin Valley; scenes along the road; desperate-looking idlers; an alien principality; Fresno; hard lot of hired hands; a gossipy waiter; work not words the best recommendation.

WE left San Francisco the last day of March, 1886, homeward bound, with our line of travel definitely marked out over the line of the Southern Pacific Railroad, *via* Los Angeles, San Antonio on to New Orleans. Outside trips included the Grand Cañon of the Colorado—which we chose in lieu of the Yosemite Valley—the environs of Los Angeles, and a run down to San Diego.

Before starting out for "pastures new," we always made it a point to obtain all the information concerning them that was readily available, and the laddie, as well as his elders, was pretty thoroughly posted as to the things he was to see, and the chief features of interest. California was looking her very best—low hills and valleys green, and the whole country fairly aflame with the bloom of wild flowers. It was hard to realize that in a few weeks the hills would be brown, the country roads a foot deep with dust, and the only green grass to be seen, that kept so by irrigation.

The daily overland train left San Francisco at half-past three in the afternoon; but by studying the schedule we found that a local train, going as far as Tulare, left in the morning, reaching its destination at seven in the evening, and the overland could be boarded the following morning at two. This arrangement would give us daylight for almost the entire route to Los Angeles, and for this reason we chose it. It had rained the previous night, and the "splendid scenery of the sky" was unusual for California—lovely fleecy clouds floating against the blue of heaven, and California skies are as a rule, either quite cloudless or all clouds. Wheat was waving in verdant billows on all sides, and near Vallejo Junction, some 30 miles south of San Francisco, was a large, clean-looking brick flouring mill. There it was claimed the best wheaten flour in California was made. Every little town planted on San Pablo and Suisun Bays and the connecting straits, wore a pretty and thrifty air.

We soon entered the San Joaquin Valley, through which we rode for the entire day—less level and less attractive as a farming region, as seen from the railway, than the Sacramento Valley, and the wind-mills for raising water were in greater abundance. Indian pinks—a rich magenta in hue—rayless yellow compositæ and California poppy of brilliant orange—as much red as yellow—lay in solid masses of color, acres in extent—a wonderful sight and recalling Wordsworth's lines:

"Of flowers that with one scarlet gleam
Cover a hundred leagues, and seem
To set the hills on fire."

On both sides of the broad valley rose mountains—to the east the Sierras, to the west the Coast Range, the foot-hills brilliant with flowers, purple phacelia, larkspur of royal blue, and always the poppies and Indian pinks. The further south we rode the less attractive appeared the country—houses more remote, and the smaller railway stations composed of the distressing "palisade front" saloon and corresponding architecture. We crossed the Stanislaus, San Joaquin, the Tuolumne and the Merced Rivers—the latter being the stream that flows through the Yosemite Valley. At Berenda, 177 miles from San Francisco, a branch road runs off to the east toward this valley, making the tiresome stage ride some 20 miles less in extent, and year by year the fatigue of making this trip will be gradually lessened. Madera, the point further north on the road where one takes stage for the valley by a different route, is a forlorn little place, and at all the ugly little stations there were great groups of idle men, some of them desperate looking-fellows. We passed a bulbach plantation white with bloom.

For several miles we rode through one of the largest ranches in California, owned by Miller & Lux, who are said to be Germans, and who came to this country as adventurers, and have succeeded, like a good many other foreigners, in fencing in a large patch of our country's domain. A man in the car told us that the railway ran for 50 miles along one of their fences; that they raised a great deal of stock and controlled the meat market in San Francisco; also, that they own land so located that in driving their cattle from Mexico they can halt every night on their own ranches. They manage personally all their land and have no tenants.

Fresno is a "city" of some note on this route, and is reached from the north after a long ride through what is locally called hog-wallow land—the surface a continuous stretch of "hummocks" of which there is considerable in California. Fresno has trees—eucalyptus—some pretty buildings, and is rather a pretty town in spite of its crudities. We were told that for 25 miles toward the Sierra Nevada the country was a succession of vineyards and that the chief industry of Fresno was wine making. Tulare has a population of 2,000, and it was here that we were to pass the fraction of the night, in the endeavor to get some refreshing sleep. As we were eating supper in the hotel, the waiter, a gossipy fellow, informed us that they were preparing the dining room for a ball-room supper at midnight, but assured us that we would not be disturbed by the clatter. He said there were always a great many balls in California—that it was the great amusement of the country people—they came in from the ranches for miles around. He said he had worked on a ranch—that hired men were not treated as men, but as things, and that to sleep in a house on a bed, as hired men do in the East, was a thing unknown in California. They either rolled themselves up in a blanket and slept under a tree, or slept in a bunk under cover; that the owner of the ranche would practically say to his men "Here are a thousand acres"—or ten thousand as the case might be—"you can sleep anywhere it suits you best, the only thing that I require of you is that you put in an appearance on time in the morning." He said that there was a great deal of malaria at some places, and that quinine was given even to the dogs and chickens! The waiter seemed to be quite a nice fellow—had accepted that kind of work temporarily because he could find nothing better to do—and, like so many young men on the coast, had drifted around from one place to another, without taking root anywhere. He said a great many young men came from the East bringing letters of recommendation, and expecting to obtain a situation at once at $100 a month. It amused him and he always advised them to take $30, if they had the good luck to be offered that much. As for recommendatory letters, they amounted to nothing in San Francisco—a statement I often heard confirmed—that employers didn't care a straw for a young man's previous position, but valued him only in proportion as he answered to the requirements demanded of him.

RURAL SPECIAL REPORTS.

Canada.

FREDERICKTON, N. B., Sept. 18.—The rainfall in New Brunswick was exceedingly light the past Spring and Summer, and has been so thus far this Fall. In consequence, the hay crop is not more than two-thirds of an average yield. Oats and barley are well filled, but the straw is light. Potatoes are a good crop and mainly free from rust. Apples are yielding enormously; two of my trees have broken down under the great weight of fruit. G. D. S.

Michigan.

CADILLAC, Wexford Co., Sept. 25.—This has been a disastrous season for us. Absolutely no rain all Summer and frost every month in the year. No hay at all and small prices for all crops; too much "shipped in." The late heavy rains have started fruit trees in a new growth and they will get badly injured next Winter, I think. H. L. K.

Nebraska.

MADISON Co., Sept. 23.—Crops in general along the Elkhorn Valley are good. Late potatoes a little short of the average. S. S. C.

Oregon.

ANTELOPE, Wasco Co., Sept. 17.—Crops about one-fourth. Grass short. Season very dry. Gardens poor except where irrigated. M. J. W.

Virginia.

RICHMOND, Henrico Co., September 25.—This week the tobacco market has been uniformally dull, and until the new crop has been secured no change of note in transactions can well be expected. The weather has continued to be very favorable to the crop, both as to ripening and growth, particularly so on dark tobaccos. The cool nights and dews thicken it, and the warm, sunshiny days spread the leaf and ripen it; and much that has been lost in quantity planted will be again made up in increased weights, and consequent improved quality. This improvement as a rule holds good in this State to date. Brights may not come up to this estimate of improvement, but will show a more favorable condition, even though reports conflict. Leafy full wrappers must be comparatively scarce. Some cutters were sold at good prices this week. Wrappers remain quiet. T. H. M.

Washington Territory.

NORTH YAKIMA, Yakima Co.—A mistake was made here by irrigating too much in the fore part of the season. This irrigating system is but improperly understood as yet on our alkaline loams. We have more sunshine to the square acre than any other farming country in the United States. We are in the midst of hop picking now. B. F. V.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

KEROSENE EMULSION.

F. H. B., Orlando, Fla.—How should Paris-green and London-purple be used as an insecticide in orange groves?

ANS.—Paris-green and London-purple are of little use in the orange grove. The scale insects, which are the greatest enemies to the orange, will not be affected in the least by either of these arsenical mixtures, but are effectually destroyed by the kerosene emulsions. The formula for kerosene and soap emulsion found most effective by the orange growers and truck-men of Florida, and which Professor Riley strongly recommends, is as follows:

Kerosene.....2 gallons=67 per cent.
Common soap or whale-oil soap ½ pound } =33 " "
Water.....1 gallon }

Heat the solution of soap and add it boiling-hot to the kerosene. Churn the mixture by by means of a force pump and spray-nozzle for five or ten minutes. The emulsion, if perfect, forms a cream, which thickens on cooling, and should adhere without oiliness to the surface of glass. Dilute, before using, one part of the emulsion with nine parts of cold water. The above formula gives three gallons of emulsion, and makes, when diluted, 30 gallons of wash. The kerosene and soap mixture, especially when the latter is warmed, forms, upon very moderate agitation, an apparent union; but the mixture is not stable, and separates on standing or when cooled or diluted by the addition of water. A proper emulsion of kerosene is obtained only upon violent agitation. It is formed, not gradually, but suddenly: in short, to use a familiar phrase, "it comes," like butter. The time required in churning depends somewhat upon the violence of the agitation, but still more upon the temperature, which, however, need not be much above blood heat. When obtained, an emulsion of kerosene and soap is known by the perfect union of the ingredients, and the absence of oiliness, so that the liquid clings to the surface of glass or metal. It resembles a rich cream, more or less thickened according to the proportion of soap used in the mixture.

TREATMENT OF KICKING HORSE; CURE OF WARTS; FEED FOR FATTENING HORSES.

F. H. V., Bowman's Bluff, N. C.—1. What will stop a mare from kicking with both feet in a wagon? 2. What will cure warts? 3. What kind of food would be good for fattening a mare about 12 years old and very thin?

ANSWERED BY F. L. KILHORN.

1. Much depends upon the disposition of the animal, the cause of the habit, and her previous management. A few horses may be effectually broken of the habit by the judicious use of the whip; but in many cases this only makes matters worse. A simple method, usually effective, is to buckle a strap with a ring around the near fore fetlock. Into the ring fasten a half-inch rope or strong driving rein, pass back through a ring in the belly-band (or above the belly-band) to the wagon. Whenever the horse attempts to kick pull on the rope or strap, which will bring the fore foot up to the elbow. The horse is now on three legs and cannot well kick. Repeat until the horse gives up the habit. If the horse kicks while being harnessed, hitched, or immediately after being hitched, loop a short side strap around one fore fetlock, raise the foot to the elbow and buckle the strap tightly around the forearm. This will compel the horse to stand on three legs, when he can be safely handled. A course of training adapted to subdue the animal might also be desirable. 2. If the warts have a neck, cut close to the skin with a pair of sharp scissors and cauterize the cut surface with any dry caustic, (nitrate of silver, sulphate of copper, etc.) Broad, flat warts that cannot be cut off, may be eaten away by caustic. If hard and dry, use muriatic acid, applying the acid with a blunt-pointed wooden pencil bruised at the end. Care must be taken not to get the acid on the adjacent skin. Scrape the wart as fast as eaten by the acid, and continue until the wart is entirely eaten out. For warts that are cracked or sore use the copper sulphate or other dry caustic. 3. Cut hay and ground feed mixed and moistened, but not wet. For the ground feed mix equal parts by measure of ground oats, corn meal and wheat bran or middlings, and one-fourth part of oil-meal. Feed three to five quarts of this mixed feed and three to five pounds cut timothy hay thrice daily, according to the size and needs of the animal. Roots or potatoes night and morning would be excellent. The horse should receive daily exercise, or light driving or the run of a yard; occupy a clean, dry stable, and be groomed daily. Give twice daily in the feed, one ounce each powdered gentian and ginger, and two drams sulphate of iron. On alternate weeks replace the iron by two drams powdered cinchona bark. If the bowels become costive, add two drams aloes until relieved.

SMUT AS CATTLE POISON.—NASAL GLEET IN A HORSE.

D. S., Augusta, Kans.—1. Will smut on corn kill cattle? 2. What will cure chronic nasal gleet in a horse?

ANS.—1. Yes, occasionally when fed in large quantities. If fed in moderate quantity with other suitable food, there is but little danger. It is especially injurious where there is a scarcity of water. The evil effects of feeding smut, however, are usually not as marked as those from the feeding of ergotized grains or grasses. Abortion may also be produced from the excessive feeding of smut. To avoid the evil effects, feed the fodder well moistened, and allow free access to salt and good water. A liberal daily allowance of roots, potatoes, or oil meal will be beneficial in keeping the bowels open. In the absence of these, bran slops or mashes once daily will be beneficial. Whenever the bowels become costive, as they are liable to do, give two or three ounces of Epsom salts, or an ounce each of gentian and ginger twice daily until relieved. 2. Inject the following solution into the nose once or twice daily with an enema syringe, or, preferably, a nasal funnel: Sulphate of copper or zinc 30 to 40 grains, glycerine an ounce, water one quart. The method of injection is unimportant, but it is essential that the solution reach all parts of the nasal membrane. When injected, the solution should be about blood-warm. If this wash does not check the discharge in a few days, you may usually conclude that you are dealing, not with simple nasal gleet, but with a discharge from some of the mucous cavities connected with the nose—sinuses of head, gutteral pouches—or with some other disease—abcess from carious teeth, nasal polypus, or with a case of glanders—either of which should receive the attention of a veterinary surgeon.

HAIR WORMS.

G. P., Trenton, N. J.—What are the name and history of the worms specimens of which are inclosed?

ANSWERED BY PROF. A. J. COOK.

The worms are Gordii, or Hair Worms. It is said that when a horse's hair falls into the water, presto! there comes forth a living worm. Verily the day of miracles has not yet passed. To be sure this is flesh-colored, and not black: but are the tails of all horses of the same hue? Seriously, these hair worms, or Gordii, are in no wise related to the horse; but their life history adorns another tale quite as startling. They deposit strings of eggs into the water. These eggs hatch, and the young pass into the stomach of some dipterous maggot, as the larval mosquito: when partly developed they pass with their host into the alimentary canal of some hungry fish: here they develop further, and are finally ejected, to be again lapped up by some luckless cricket, beetle, etc. Here the hair worms mature, and often fairly crowd the whole interior of the insect, which may now be said to be struggling with the "worms." Now let the feverish cricket but hop into a pool, water pail, rain trough or any other water, and at once the gay worms crowd forth, ready again to scatter their eggs in preparation for the same marvelous round of vital changes. No wonder the non-scientific thought them changed horse hairs, for how strong the resemblance, unless we call the microscope to our aid. Then we find they have mouths, stomachs, indeed complete alimentary canals, and are both male and female. No wonder the scientist called them Gordii, for the old Gordian knot was not more intricate than the knots into which they tie themselves, and yet each one is the Alexander to untie itself.

WORMS IN A MARE.

H. B., Belle Plaine, Ia.—Everything my young mare eats seems to ferment and cause bloat, which is attended with hard coughing until the wind escapes from the stomach. She is also troubled with worms of the large kind. Her appetite, is good and she is otherwise healthy. What should be done for her?

ANS.—For the worms give at evening four or five drams of Barbadoes aloes to open the bowels. Then, each morning for a week, give two drams each of tartar emetic, sulphate of iron and aloes, and one dram of carbolic acid. If the bowels become too loose, omit the aloes. On the seventh morning give another dose of aloes; also slowly inject, per rectum, several quarts of a strong solution of quassia, the solution to be milk-warm when injected. Feed sparingly and allow only moderate exercise during this treatment. After the above, feed moderately on a laxative, nutritious diet, and give morning and evening in the feed one-half ounce each of sodium carbonate, gentian and ginger. At the noon feed add one ounce gentian and one dram hydrochloric acid. Thorough daily grooming will add greatly to the improvement. If the cough continues, take six drams of extract belladonna, two ounces of niter, and mix with sirup to form a thick paste. Make into six balls and rub one upon the back teeth, to be swallowed at leisure, three or four times daily.

KEEPING FLOWERS OVER WINTER.

D. N. D., Lake Grove, L. I.—Having a place to keep flowering plants through Winter, I thought of digging a pit below frost, putting in it a bottomless box, and setting the plants in it in earth or pots, covering the box with slats, on which hay or straw would be placed, and then earth. Would this method of keeping them be safe? If not, what would be a better way?

ANS.—We very much doubt whether plants would live under the treatment suggested. They might, but it is extremely uncertain. We are not informed what varieties of plants our correspondent wishes to keep. Cannas and dahlias, or any tuberous roots should be dug up and stored like potatoes. Geraniums, coleus, and such bedding plants, may be cut down to the main stems, potted, and put in a light room, kept above freezing, without reference to absence of sunshine. They would not make much growth without sun, but would keep alive. We would not advise experimenting with the pit, unless it is immaterial whether the plants survive or not.

HAIR FALLING OFF A HORSE.

B. W. M., Fredonia, N. Y.—Last Spring the hair began to fall off my mare's head in places; then it fell off the neck also; and small lumps came under the skin as far back as the shoulders; now a bare spot is beginning to grow on the hips. The bare places itch, and the animal rubs them and tears the skin off, and the places immediately scab over; when rubbed, stuff like dandruff from a person's head comes off. She eats and appears quite well. What ails her?

ANS.—The horse evidently lacks proper care. The bald places may be due to this want of care, or to parasites. See that the horse receives a *thorough daily grooming* of at least 40 minutes—an hour would be better—until the skin has been cleaned. Every two weeks wash the animal with warm water, to which add one teaspoonful of ammonia to each quart of water. Work rapidly, rub dry, and blanket for a few hours to make sure that the horse does not become chilled. The bald places will probably all disappear in a few weeks. If not, paint with tincture of iodine. Give the horse twice daily in his feed, one-half ounce each of powdered gentian, ginger and sodium bicarbonate.

SPRAINED BACK IN MULE.

G. B. K., Mobile, Ala.—A mule's spinal membrane has come apart a little just over the hips. Back of the loins he can't turn short around, and sometimes when he strikes hard ground with one of his hind legs, he draws it up and hobbles on three legs for a few minutes, and when he walks on it again he does so stiffly, with the leg turned outward.

ANS.—The mule ought to receive the personal attention of a competent veterinary surgeon, otherwise place and keep him in slings and apply a cantharides blister over the seat of the injury. Cut the hair close and rub the blister well against the direction of the hair. Tie the animal so that he can't rub the blistered surface with his mouth. When the blister is well raised (12 to 24 hours), carefully wash with Castile soapsuds, and anoint daily until healed, with vaseline. The case is apparently a severe sprain or perhaps fracture, and unless the mule is quite valuable it might be more profitable in the end to kill him at once, as a recovery is uncertain.

LAME PIG.

J. A. M., Halcottsville, N. Y.—My five-months-old pig about six weeks ago began to get stiff in the fore-legs; now he can hardly walk. When moving he does so like a badly foundered horse. He doesn't stand on his feet at all, but he sometimes gets on his knees for a few moments. He eats very little. The cords on the backs of his legs seem contracted. What should be done for him?

ANS.—The stiffness may be due to the feed (which you should have stated), injury or exposure, or to constitutional weakness. Give one ounce linseed oil, and repeat next day if the bowels are not moved. Feed on milk, with middlings, and ground barley or oats, but little or no corn. Bathe the limbs daily with one ounce each Castile soap and camphor in a pint of spirits. Give a comfortable bed on a *dry* ground or board floor.

Miscellaneous.

J. S., Kerbyville, Oregon.—1. Will it pay to plant pear trees for hog feed? 2. From whom can I obtain Coburn's Swine Husbandry? 2. Where can crude petroleum be obtained? 4. From whom can Japan Chestnuts be obtained by the 1,000?

ANS.—1. We should say not. 2. American News Co., N. Y. 3. Paint or grocery stores. 4. Storrs, Harrison & Co., of Painesville, O.

J. S., Brattleboro, Vt.—What is the tree a specimen of which is inclosed?

ANS.—It is Magnolia acuminata or Cucumber Magnolia. It is upon this that many of the more tender kinds are grafted. It forms a charming tree for the lawn if cut back somewhat from year to year for the first 10 years of its life.

E. A. P., Kirkville, Ia.—How can I preserve the seeds of the hedge thorn?

ANS.—As good a way as any is to mix them in sand in a box. Bury the box a few inches below the surface in a well-drained soil, and sow in the Spring.

B. B. L., Green Lawn, N. Y.—You can probably get Velvet Chaff Wheat from W. C. Latta, Perdue University, Lafayette, Ind.

ubscriber (no address).—The large green insect left at this office in a box is the larva of one of our largest silk moths—Platysamia Cecropia. It feeds on apple and many other trees, the leaves of which are often stripped by the large caterpillars. These larvæ develop into moths, which lay many eggs, and the wonder is that there are so few of the caterpillars. This is due to the numerous parasites which destroy the insects in prodigious numbers. The larva left here was infested with these parasites, and so would never have developed into the beautiful moth.

DISCUSSION.

C. J., OREGON, Mo.—C. L. N., on page 622, replies to one who said farming does not pay. I say it does not pay west of the Mississippi and south of the Ohio, *i. e.*, where produce must be carried long distances. Here we reside within from 100 to 700 miles of the best fruit markets in the world; but does it pay to raise fruit to ship? No! Just as many charges are put upon it as it will bear. Consumption is so restricted by the high prices due to this that the markets are quickly overstocked. It costs the price of a bushel to move it 500 miles. About one year or two in nine prices get up a little, and then freights rise, too. About half the farmers of the United States, and those dependent upon them, are thus forced to economize to such an extent that Eastern manufacturers can't sell all the wares they make. Here is the secret of the whole trouble. We are restricted consumers of manufactured goods during seven years out of nine.

J. S. T., WALCOTT, N. Y.—I set out 48 Shaffer's Raspberries one year ago last Spring, and this season picked 103 heaping quarts. Was this a large yield for the first year's picking?

R. N.-Y.—Yes. The above was a large yield for the first season for any raspberry. Shaffer is a productive variety and the quality is rich when fully ripe. Those who use it once look around for more when again in market. It shades the soil so as to prevent weeds and grass from making much headway.

G. E. B., Waynesville, N. C.—I mail the RURAL a few chestnuts from a tree or bush on a neighbor's farm. It is not quite 10 feet high and has been bearing several years. It is very productive and seems to be a genuine dwarf. There are no foreign trees in this region, so that it is a native. It is growing in an old field that has not been cultivated for several years. The nuts are smaller this year than usual. Our altitude gives us the climate of Southern Pennsylvania.

R. N. Y.—The nuts are rather small, but very sweet. It is high time that more attention were given to improving our native chestnut.

Miscellaneous Advertising.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your grocer for Dixon's big cake.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, OCTOBER 9, 1886.

A CONTINUATION of our special reports of fairs (New York State and Nebraska) will be found on page 682.

"I HAVE heard it estimated by dealers that fully one-half of all the fruit sent to market was so badly packed or so badly carried as to pay little, if any, profit to the grower." See Parker Earle's article on page 672. Hence one-half of all the labor and capital invested in fruit-growing in this country is *wasted*.

THE Kaffir Corn (a sorghum) is very much prized where it has been tried in the South. It seems that the first growth is cut for forage when in early bloom. The second growth yields both grain and forage in late Fall. Our Northern seedsmen (or several of them) will offer it for sale. The heads are very large and must give a heavy yield of grain which, it is claimed, makes a better quality of flour than any other of the sorghums. We have seeds and shall try it another year.

IN our next seed distribution, which will be announced ere long, will be a variety of field corn which we believe to be earlier than any other tried at the Rural Grounds. The grain glazed with us in 85 days. The ears are large, the kernels are one-third larger than those of the absurdly-named Angel of Midnight; the plants do not grow so tall. A peculiarity of this variety is that the same plant often produces both pure yellow, dark-red or mottled grains upon different ears—each apparently as *fixed* as if it were a thoroughbred.

We hope to retain for years to come as in years past, the bulk of our old subscribers without any further inducement than that which the RURAL NEW-YORKER *itself offers. If they continue to need and to prize it, they will continue to subscribe for it. In order to induce those who would gladly see its circulation largely increased to aid us in this work, we have placed before them two propositions. The first is that in clubs of five or over, the price will be (until further notice) $1.50 per year. The second is embodied in the premium-list, a careful examination of which will certainly show that adequate compensation is offered for any effort our friends may kindly make in the* RURAL'S *behalf. Send for it if you have not received it.*

MR. J. H. HALE writes us, under date of September 25, as follows:

"The RURAL'S illustrations of the Carman Raspberry are very fine. Such a fine-grained, solid, compact berry shows up well in a cut; but as to size, our whole crop of 500 plants the past season averaged much larger than that shown on the first page of the RURAL: but, then, the public have been so deceived with overdrawn fruits it will be a glad surprise to them when they come to fruit the Carman to find the berries are larger than the picture. Earhart is still doing wonders here. It made a great show of fruiting canes at the State Fair last week, and again at the Rhode Island State Fair this week.

South Glastonbury, Ct."

SECRETARY GEO. W. CAMPBELL writes us as follows: "I have been really pleased at the result with Niagara seedlings that have fruited here, and that I have seen both from the northern and southern portions of the State. I believe *all* that I have seen have been quite equal to the Niagara in quality—and several were decidedly better in that they were free from foxiness. It is a little curious to me that all are white. Seedlings from others have almost always been varied. I have seedlings from Walter, black, white and red; seedlings from Worden crossed with Delaware and Purity, red, white and black. Almost all vary; but Niagara seedlings apparently do not, in color. If I live a few years I hope to send you many interesting results when a little further developed."

WE have received the following note from J. Troop, Professor of Horticulture in the Purdue University, Indiana:

"In speaking of the different varieties of wheat grown at the Indiana Agricultural College (RURAL of Sept. 18), you say the Velvet Chaff is described as bearded, while that raised at the Rural Grounds is *smooth*. I will say that we also have the smooth variety, which came to us under the name of Greenawalt, and is mentioned by that name in the bulletin. I might add, further, that we now have obtained, by selection, *four* distinct types of the Velvet Chaff, viz.: brown-bearded, brown smooth, white-bearded and white smooth *i. e.*, white and brown chaff."

SOMETHING should be done to close the mouth of Wiggins, the false prophet. He has proven himself to be a fraud. He has done damage enough. The widest publicity was given to his recent prediction of a new earthquake. Thousands of people were frightened into idleness, and a considerable loss of time and labor was experienced as a result of his dismal guessing. One can hardly blame people who passed through the horrors of the late earthquake for being nervous when the papers publish these absurd "predictions." Is not a man like this Wiggins who causes so much excitement and fright guilty of a crime? The newspapers of the country are far too eager to publish sensational reports without thinking of the mischief they may cause by so doing. They should boycott this Wiggins and keep his "predictions" out of print. This they owe as a duty to the American public.

CHESS AND WHEAT.

A FARMER, who, from a long life's experience in raising wheat, is confident that it sometimes changes to chess, brought to this office as many as six plants which apparently were both wheat and chess. The roots of each plant seemed to be those belonging to but one plant, and they were so matted together that even after all the soil had been washed out it seemed impossible to separate the wheat from the chess. "Now," said our friend, "if the plants are separate the roots can be separated or traced." We undertook the task of separating them without breaking a fiber. One by one the fibers were disentangled and over an hour was thus spent before the tedious job was completed. In one case the chess stalks seemed to start from the wheat roots and for a few minutes we were in doubt whether at last an actual instance of this change were not before us. It was found that the neck of the chess grew horizontally for two inches, resting upon and concealing the wheat neck which had also grown horizontally, while the fibrous roots of each were so intermingled that only the chess neck could be seen. When such specimens are encountered and less carefully examined, it is not to be wondered at that there are farmers who grow angry when they are told that wheat never changes to chess.

FIGHTING AN UNSCRUPULOUS MONOPOLY.

THE American Cotton Oil Trust Company is one of the largest and most unscrupulous monopolies in the country. By the most tyrannical means it has obtained control of 80 cotton seed oil mills in the South, and turns out 90 per cent. of all the cotton seed oil produced in the Union. Whenever any independent mill declined to join the combination, the policy of the syndicate has been to threaten to establish or actually start an opposition mill in the neighborhood and buy up all the seed at figures which the local mill could not afford to pay, thus ruining the latter. Having once obtained control of the business, it began straightway to plunder the planters and the public. Last season the price of cotton seed on the levee at New Orleans and Memphis was as high as $16 per ton. Then it was brought down to $11 by a combination of the crushers; then to $10, $9, and finally to $8, when the planters began to complain loudly. At last it decided to pay only $5 a ton for seed on the river bank, and in view of cost of hauling it there, little or no recompense was left to the grower. The planters of the Mississippi and Louisiana, it is estimated, could not get more than 60 cents a ton for their seed. While the price of seed has been put down in this way, that of the oil has been raised from 37½ cents in 1885 to 40 and 41 cents per gallon for prime summer yellow at present.

AT last the cotton planters of Louisiana and Mississippi have organized in opposition to this unprincipled monopoly. It is proposed that all planters shall refuse to sell seed to the mills for one year, forcing the latter to remain idle, and thus crushing the crushers. By this arrangement the planters will lose little, for if the seed is used as a fertilizer it will be worth at least the insignificant sum offered them by the mills. Of course, the growers are too numerous for all to remain in the combination against a quiet offer of better prices by the monopoly; but since the organization was formed the other day the Cotton Trust certificates have fallen from 57 to 54 1-8 in this market.

THE new Premium-List of the R. N.-Y. is available to all who send yearly subscriptions at the regular price, viz., $2.00. It is a matter of choice whether they retain the cash commission of 50 cents for each subscription in clubs of five or over, or select any of the articles from the Premium-List, which are sealed so as to allow an equivalent of from one to two dollars for each subscription, according to the arrangement which we have been enabled to make with the manufacturers of those articles.

FARMERS TO THE RESCUE!

OVER $500,000 have been already contributed for the relief of the distressed among the 50,000 inhabitants of Charleston, and money is still coming in by thousands of dollars every day. It comes from the North, South, East and West; for in this glorious country generosity and charity are confined to no section and to no class. The Charleston relief fund, however, has been contributed almost entirely by the large cities, and the mercantile, professional, manufacturing and operative classes. This is quite natural. "A fellow-feeling makes us wondrous kind," and dwellers in cities should be foremost to relieve dwellers in other cities affected by any grievous calamity for which they are in no way responsible. What an earthquake has done for the city people of Charleston in a few seconds, a drought has done for the farmers of Western Texas in 15 months—reduced them to a deplorable condition, which appeals for aid to the generosity and charity of all their countrymen and more especially to the sympathy of their fellow-farmers everywhere.

The affected district embraces 10 counties. Hundreds of the inhabitants haven't tasted meat for a year, unless perchance, they caught or shot a rabbit. Children have not for months had a drop of milk. Water and meal have been the only support of the great majority of the people for a twelve-month. In some localities water had to be hauled in tanks from 10 to 30 miles. Within the last six weeks rain has come to the dried-up region and the ground is once more in a condition for cultivation. Wheat is the principal crop of the section. That and all others put in last Fall and Spring either failed to germinate or soon perished. What the poor farmers—mostly new settlers—most need is seed wheat. Drought has left them without money to buy seed themselves, and under the laws of Texas they cannot mortgage their land to secure the means to buy. The Rev. John Brown, a Presbyterian minister at Albany, Shackleford County, Texas, has been sent North to procure aid for the distressed. "Unless I succeed," he writes us, "I do not know how many of them will live through the Winter. If seed can be supplied the stores will generally give credit until next harvest, and in this way, with what help the Relief Committee may be able to give, they will pull through." Contributions and correspondence can be sent to the Rev Dr. Kendall and the Rev. Dr. Roberts, Secretaries of the Presbyterian Board of Home Missions, 280 Broadway, New York, or to Mr. Brown at the same address. Is there any need of urging our readers to be generous to their fellow farmers starving in far-off Western Texas? Even a bushel of wheat, or, better, the price of it, from each man who reads this would be a godsend. Will not the farmers of the country do for the stricken farmers of Texas, what the city people of the country have done for the stricken city people of South Carolina?

NEW KINDS UNDER OLD NAMES.—THE DUTY OF EXPERIMENT STATIONS, ETC.

FOUR years ago, or thereabouts, when Martin's Amber Wheat was first announced as a new, wonderful variety, we grew it in our wheat plots and found it the same as Armstrong. Armstrong was sent to us about eight years ago, and we were surprised two years or more later to find it advertised as "Landreth." Still later the Martin's Amber was advertised as the most productive wheat in the world. During the past two years we have received several heads, as severally named, that seemed to be identical with Armstrong-Landreth-Martin's Amber. So it goes. The experiment stations are raising and commenting upon Martin's Amber and Armstrong and Landreth, giving different yields, strength of straw, etc., as if they were different. With the exception of C. S. Plumb, of the N. Y. Ex. Station, who writes us, under date of September 22, that they are the same, not one of the Ex. Stations has stated that they are the same. And yet the directors profess to take the most careful notes, watching the young plants, the tillering propensities, the hight, color and strength of straw, differences in the heads and kernels, differences in the time of maturity, yield, etc.

We repeat: Isn't it as important that the stations should detect synonymous varieties and make them known, as that they should grow the same kinds in different soils or under different conditions, and report different values? Farmers are thus deceived and injured. One price is paid for Landreth, another for Armstrong and another for Martin's Amber. The Landreth is praised in one State, the Armstrong condemned in another, the Martin's Amber is lauded here and rejected there. So it is that the farmer may be induced to buy first the one, then the other, to find ultimately that they are all the same. And thus it is that years of useless experimentation are wasted. After all these new (!) varieties have become old and the price is that of usual seed wheat, it is too late for the Ex. Stations to inform the farming public that they are the same. The stations should be the *first* to secure and plant all novelties, and to inform the farmers whether they are really new or old, better than old kinds or poorer, so that farmers might know whether to buy Martin's Amber at five dollars or Landreth at one dollar per bushel. And so it is with oats. Thousands of dollars have been spent by farmers for Welcome Oats at five or ten dollars a bushel when the same variety might have been purchased under several different names at one dollar a bushel. And the R. N-Y. has said this so often that it is sick of the repetition. And so it is even now respecting the so-called Yankee Prolific Oats, (White Russian) and scores of other grains, fruits and roots that have been proven to be the same at the Rural Grounds.

Our esteemed farm contemporaries are free enough to print in full the bulletins of the various agricultural stations. That is right. They are rather shy of printing the results of tests at the Rural Grounds. They don't like to give "free advertising" to contemporaries. That is wrong, provided the contemporary works as hard and as disinterestedly as does the RURAL to spread information that is of the first value to the farmers of the land.

BREVITIES.

THE Earhart blackcap ripens several fine clusters of berries October 1st.

OUR fair reports have crowded the Youth's Department out of the paper this week. As a rule, such reports are pretty dry reading, but we think we have some new ideas in those of this year's fairs.

ALASKA Peas were sown August 16. First picking September 29. The vines are 15 inches high—the pods are small with few peas. But the yield is better than was anticipated. It is a treat to have tender green peas in early October.

AGAIN we have received a bunch of Mr. Marvin's new grape, the Cayuga, from H. S. Anderson, of Union Springs, N. Y. This is a good grape, very juicy, tender, sweet, and with a firm skin. We hope the vines will prove healthy and adapted to general cultivation.

THE exhibitions of poultry at the fairs make it very evident that too much stress is laid upon the feather standard. Early maturity and laying qualities are worth far more to farmers than a beautiful plumage. There is a grand chance for improvement in the present "standard."

ONE advantage claimed for the use of potato diggers is that the act of running such a machine through the soil in digging is equal to a good fall working, freeing the land of weeds and leaving it in fine condition. This idea is a good one. Fall working of land is desirable and a machine that digs potatoes and stirs up the soil at the same time, performs a double good.

JUDGING from a specimen bunch sent to this office by Wm. F. Bassett, of Hammonton, N. J., the Dolle Grape is a very showy variety. The berries are as large as those of Moore's Early, dark blue, with some bloom. The skin is thick and firm, with considerable "meat" between it and the pulp, which is rather tough and a little sour. Seeds from two to four in each berry. Except the sourness of the pulp, the quality is sprightly, juicy and very agreeable. Mr. Basset says that the Dolle is the best keeping grape he has ever seen.

Indust'l Societies.

AMERICAN HORTICULTURAL SOCIETY AT CLEVELAND.

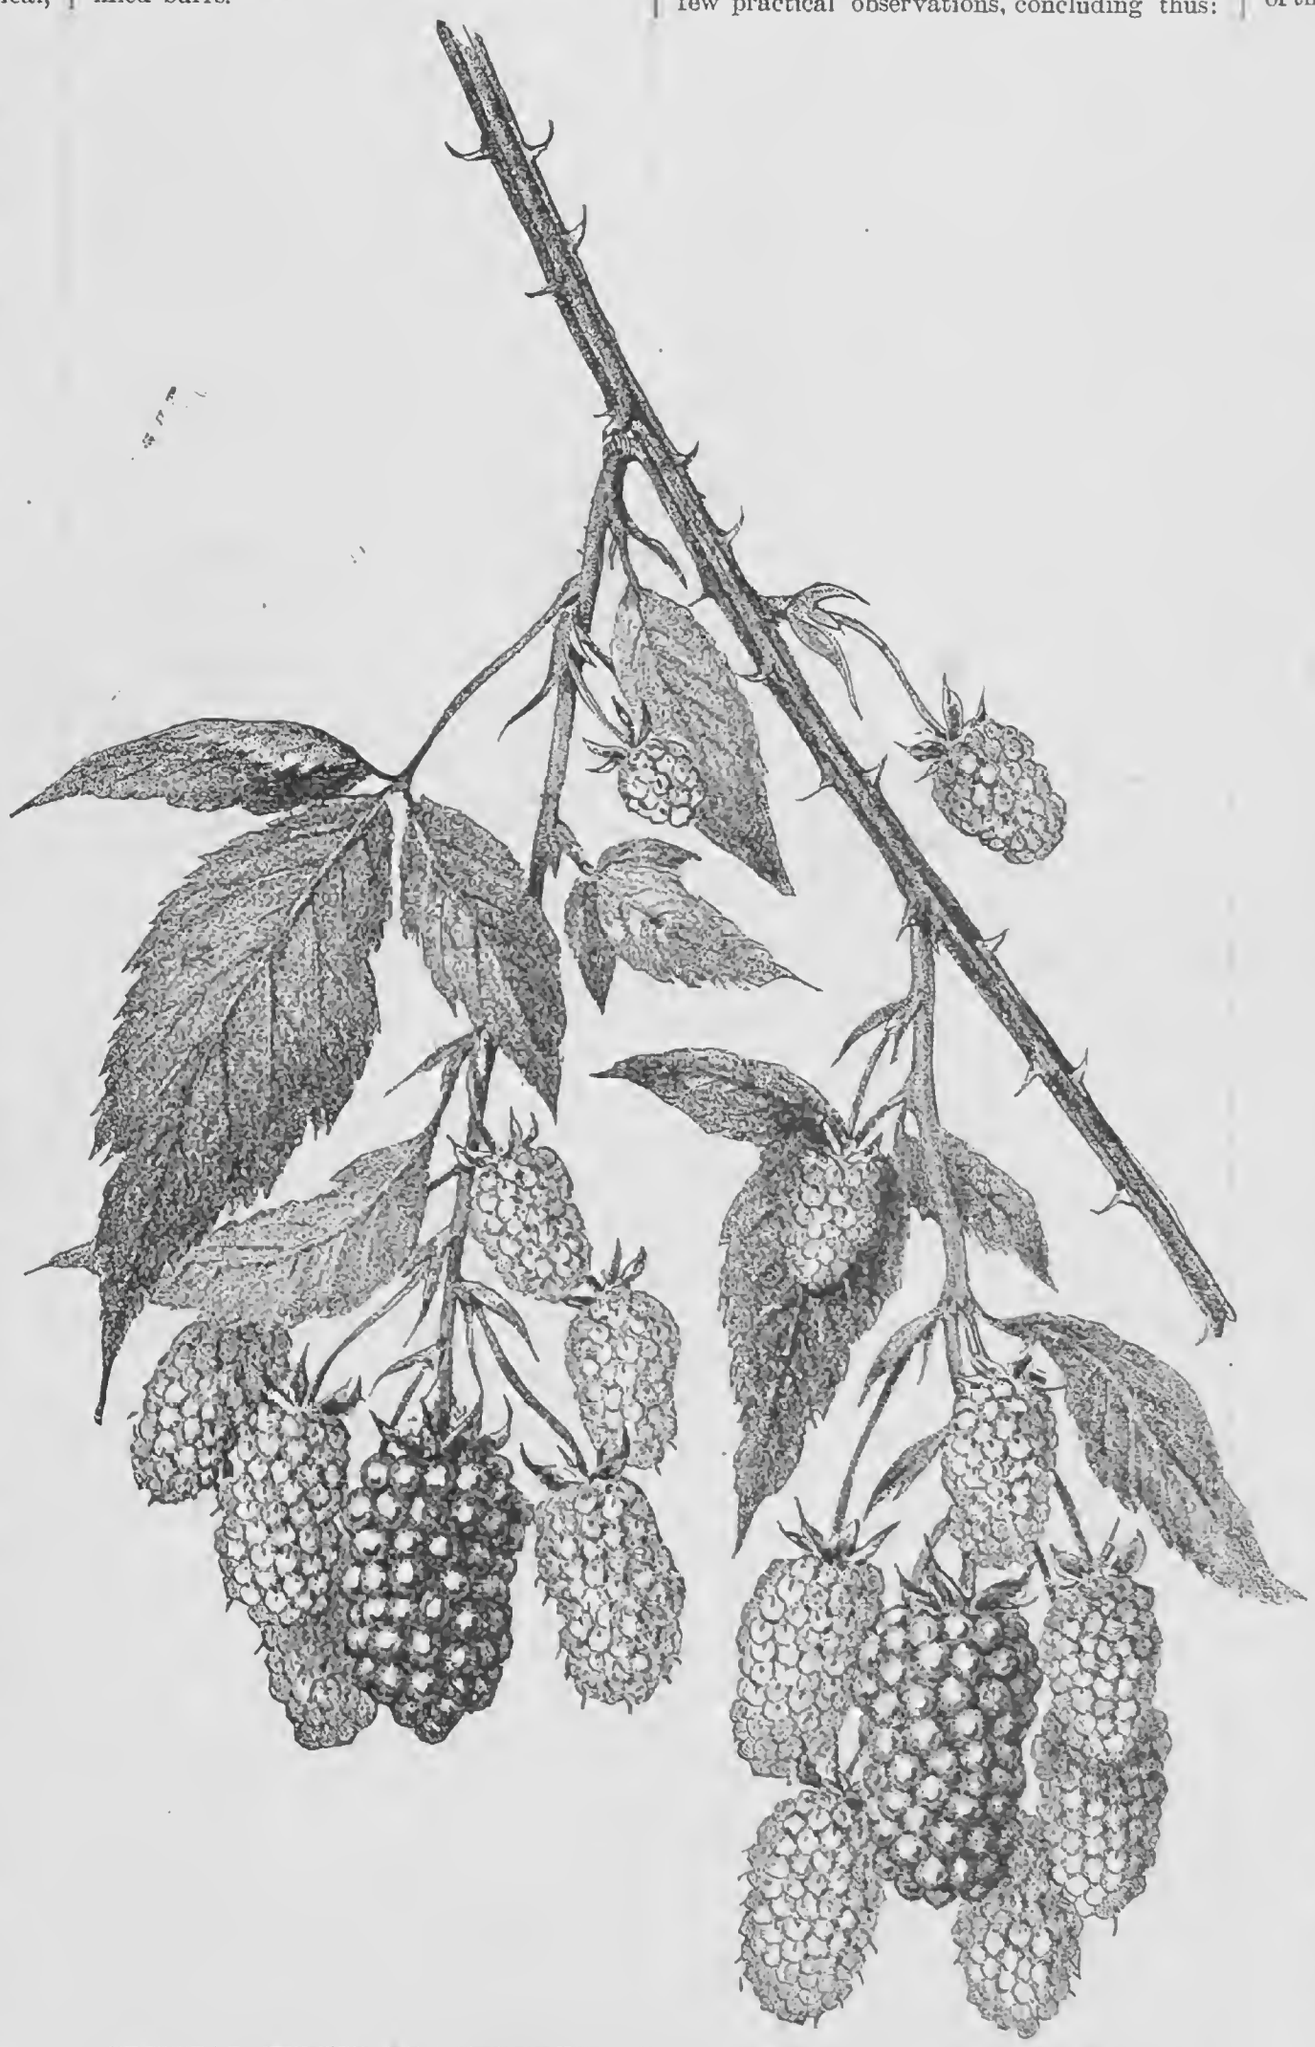
(RURAL SPECIAL REPORT CONTINUED.)

Vegetables in Japan; nut culture for pleasure and profit; most profitable kinds for various sections; Japan chestnuts; other sorts; filberts; almonds; walnuts; pecans; their culture; hickory-nuts.

THE paper on "vegetables in Japan" by Kizo Tamari, was of much interest. It was well written, but his Japanese tongue made it difficult for members to understand him. He said in substance, "We have many culinary vegetables of good quality in Japan. The choice of edible plants differs with countries and peoples, depending upon climate, social condition, tastes and methods of cooking. No other vegetable is so extensively used in Japan as the radish. They are mostly cylindrical, one-fourth of an inch to over a foot in diameter, and often over a yard in length. We have them the year around. Our carrots are longer and thinner than yours—two-and-one-half feet long, sometimes. Burdock comes third in general estimation, the root growing one foot around and three feet long in a year, soft and delicious. Turnips are used like radishes in America. Caladiums are extensively grown, and used like potatoes here. Six or seven million bushels are raised annually: taste like potatoes, but more mealy. Sweet Potatoes are largely grown in the south where farmers live upon them; other potatoes are raised in the north. Japanese yams are used in variety, but the roots of wild plants are better; these grow two inches by three or four feet in a year, very hard to dig. Lilium tigrinum is grown in fence corners, the bulbs growing two or three inches in diameter in as many years. Onions are grown like celery here, not for the bulbs, but for the long, tender stalks. We grow peas and beans in endless variety: some are used green, but most are made into different kinds of cakes, or used as parched beans. Soy bean is an important product, as great as wheat, about 11½ million bushels annually. All this is used in our culinary department, in three forms, viz: Miso, Shioyu and Tofu. The latter called Chinese cheese by the English, is very commonly used, especially away from the sea-coast where fresh fish is scarce. It contains three times as much albumen as either wheat, barley or oats. We are the largest consumers of pulse of all people in the world. We have no varieties of cabbages. Chrysanthemum coronarium is grown for its leaves and stalks; the yellow flowers are boiled, dried and used for relishes. Six or seven edible bamboos are raised. Seven species of seaweed are used, Porphura vulgaris being most highly esteemed. It is made into thin sheets, like paper. The growth and manufacture of this weed is one of our important industries." He referred to many plants used as relishes, and for flavoring, besides numerous other species not enumerated in this abstract.

Wednesday afternoon session was opened by the reading of a paper on "Transplanting in Theory and Practice," by Tuisco Greiner.

A paper on "Nut Culture at the North for Pleasure and Profit," by J. T. Lovett, was then read by President Earle, calling out an interesting discussion. The writer opens with a pleasing allusion to "the indescribable charm and fascination of nutting, which take hold of the boy as soon as his legs can carry him to the trees, which hardly weaken their grasp through life." (How strange Mr. Lovett should fail to include the girls as well.) Speaking of nut-bearing trees, he says: "That they are difficult to transplant is an error. I find them as easy as the pear, if nursery-grown. They repay abundantly in pleasure to ourselves and our children. We can hardly buy harmless enjoyment cheaper. Nut groves are not longer coming into bearing than apple or plum orchards. Japan chestnuts, almonds, filberts, dwarf English walnuts begin to bear as young as a peach tree. The commercial aspect of nut culture is, I confess, the 'hardest nut to crack.' The industry is yet too young to speak from facts. I am told almonds are largely and profitably grown in California, and that the English walnut has lately been planted on hundreds of acres there. The almond is too tender at the North, however, and we must confine ourselves to the hardy nuts. The English walnut succeeds in many of our Northern States. Patrick Barry mentions a regular and heavy yield from it in the suburbs of Rochester, N. Y. I have seen large bearing trees in New Jersey and Pennsylvania, and I see no reason why they should not prove a highly remunerative crop. Filbert culture has been tried with highly satisfactory results in some instances. Still I advise caution with this on account of its liability to fungus attacks in warm, dry climates. The black-walnut, pecan and chestnuts may be grown for fruit and timber. Pecan culture cannot help being profitable at the present price of this fruit in the markets, and the owners of regular chestnut orchards find them more profitable than apple orchards, especially the Spanish chestnut. Such is the experience of Wm. Parry and Joel Horner, of New Jersey, Samuel C. Moon, of Pennsylvania, and others. Of all native or foreign nut trees none now promises greater results than the Japanese chestnut. I have four-year-old trees covered with well-filled burrs."



CRYSTAL WHITE BLACKBERRY. From Nature. Fig. 385. (See page 673.)

Several members inquired as to how far North the pecan would succeed. Secretary Ragan said, "about 41½ degrees." Mr. Vanderman thought it would grow safely wherever the black-walnut thrived; he knew of some in Northern Kansas. Mr. Earle spoke of a tree in New Orleans 16 years old, the nuts from which last year, brought $75. Mr. Vanderman said the English walnut would not live in Kansas. Mr. Lindley, North Carolina, "The pecan does well in the central part of our State. It should be planted where the tree is wanted, as it is difficult to transplant successfully." Mr. Greiner, "It should be planted when a year old, cutting off the tap root." Mr. Albaugh thought the thinner-skinned hickory nuts deserved more attention. The pecan is not a native of any part of Ohio. Professor Claypole, "This nut question is one of interest, but perhaps also a little dangerous. I am surprised to hear of the English walnut thriving at Rochester, N. Y. All trees I know of are killed back by the Winter. The Spanish chestnut will not stand our Winters. The common chestnut seldom or never fruits except on a sandstone soil; it does not like limestone soils. Better improve our own hardy hickories: thin down the shells, enlarge the kernels. In this direction lies the greatest possibility of profits with nut growing in this country, I think." (Applause) Mr. Boggs, North Carolina, approved the suggested improvement in hickory nuts. Mr. Pierce had lately seen three-year-old Japan chestnut trees in New Jersey having eight or ten burrs each. Dr. Mackay said, "nuts grow much larger on trees never transplanted." Mr. Hollister, Missouri, "There is nothing in which the horticulturist can make better profit than in the growth of the pecan. To all having the proper soil and location, I say plant the pecan." Much more was said on this nut topic by many members, but without a kernel worth preserving, and Pres. Earle closed the subject with a few practical observations, concluding thus: "I hold that every man who plants an American forest tree that grows is a benefactor to his race." This time even the President forgot to include the women.

H. H.

We are sending specimens of the R. N.-Y. to some of our old subscribers who are not subscribers now. We respectfully call their attention to our proposition to send the Rural from now until the end of next year for $2 00, or in Clubs of Five or over for $1.50. We invite them to send for our new 16-page Premium List, which, it will be conceded, offers very liberal compensation to all who are willing to aid in extending the Rural's circulation.

MICHIGAN STATE FAIR.

(RURAL SPECIAL REPORT.)

Wet weather causes a financial failure; moderately good cattle show; Aberdeen-Angus ahead; injustice to Ayrshires; Cleveland Bay horses; coiled-spring motor; falling off in dairy interests; potatoes galore.

THE Michigan State Fair was held in the city of Jackson, and was in most respects fully an average. It was scarcely a success financially, owing principally to bad weather. The show of stock was larger, and many fine animals were exhibited. A few of the cattle were in poor condition, and a disgrace to the fair; but as a rule they showed good management, without the ever-present blanket, which was a noticeable improvement. It is poor satisfaction to look over the stock and see nothing but rows of coffee-sack blankets with horns at one end and tails at the other. One specimen of the polled Aberdeen-Angus was shown, being the first of the kind ever on our grounds. He was obliged to compete in the same class with the Galloways, but won an easy victory. The society cannot be too strongly criticised for excluding from their premium list so fine a breed as the Ayrshire. A large exhibit of this breed was made "for the fun of it."

A new feature of the fair was an importation of Cleveland Bays shown by the Cleveland Bay Horse Co., of Paw Paw, Michigan. They are of medium weight and general-purpose horses. They are always of a bay color, and are said to be practically free from blemishes on the legs. A novelty in machinery is a new spring motor, invented and made in Jackson. The power is derived from coiled springs, and is of about two-thirds of a horse power, made principally for pumping. Only eight have hitherto been made, but they will undoubtedly become popular, as they can be wound up in 15 minutes and will run for 10 hours.

In spite of the large number of creameries in the State, there was but one entry of creamery butter, while one year ago there was a large exhibit. It looks as though there is a falling off of interest in butter matters.

One of the finest features in the Agricultural Department was the exhibit of 700 varieties of potatoes shown by D. B. Harrington, of Mason. Mr. Woodman, of Paw Paw, showed a collection of 60 kinds of wheat, and between 70 and 80 of grasses, both native and foreign.

Fruit Hall contained a fine show of fruit, especially from an educational standpoint. It has been larger, but never better selected. All single plate entries of old varieties have been ruled out, and collections limited to 100 plates are required, compelling the exhibitor to use his own taste and judgment as to the varieties he will show both for family and for market purposes. This plan is a decided improvement.

The Agricultural College made a very fine exhibit in nearly every department. Among those worthy of especial mention are its collection of 70 varieties of tomatoes grown for the purpose of testing varieties. The Veterinary Department showed a collection of instruments, and mounted skeletons of the horse, the cow, the sheep and the hog, besides the horsakin—a perfect model of the body of the horse in *papier maché*, capable of dissection into nearly 100 pieces. The Mechanical Department showed numerous specimens of students' work in both wood and iron. Besides almost all varieties of turned iron, there were shown a jig-saw and two iron lathes, all well spoken of by machinists. These displays did much to popularize the College.

Good order prevailed during the fair, and the main objection that can be offered related to a failure to draw distinct lines between breeds of stock, as distinct breeds were sometimes compelled to compete in the same class.

EUGENE DAVENPORT.

THE QUEENS COUNTY, N. Y., FAIR.

(RURAL SPECIAL REPORT.)

Catering to city tastes; "hoss trots"; poor live stock exhibits; good implement displays.

THE forty-fifth annual fair of the Queens County Agricultural Society was held at Mineola, L. I., Sept. 21, 22, 23, and 24. This is one of the three or four local fairs which are attended largely by the people of New York city and Brooklyn. The excellent financial condition of the society is due largely to this urban patronage and unfortunately the exhibition is

influenced considerably thereby. The exhibition of road horses was very large and the tests of speed seemed to be the chief attraction. One good feature of the fair grounds is the location of the race track—no one need go to the track unless attracted by the races. The exhibition buildings are all between the track and the entrance to the grounds.

The cattle display was a disappointment. Only a few really good specimens of Jerseys were shown. A few good Holsteins were exhibited, but only one herd of especial merit. The cattle pens are miserably arranged; better facilities for showing fine cattle would doubtless bring out better specimens and add largely to the value of the exhibit. The show of sheep was very limited, as might be expected. Queens County is not adapted for sheep raising. It is rather remarkable that a county so near the Metropolis should make so poor an exhibit of poultry. The poultry raising industry is becoming an important one everywhere, but especially near the large cities, and the association would do well to cut down some of the premiums for trotting horses, and increase the premiums for poultry. Scudder & Townsend made a fine exhibit of Plymouth Rocks, and R. M. Seaman and other breeders were represented, but the display was not what might be expected.

The display of carriages was remarkably fine. James Downey, of Brooklyn, completely filled a large tent with his exhibit, which included every style of carriage from a road cart to the finest coach.

The implement department was well filled. Mr. H. M. Willis, of East Williston, who is local agent for nearly all the leading farm implements, led the display.

A novel grindstone treadle attracted much attention, and is a valuable implement. The R. H. Allen & Co., H. B. Griffin and others, of New York City, the Riverhead Agricultural Works, and local agents for a great variety of implements, added to the attractiveness of this department.

The fruit and vegetable show was not up to the standard. The fertilizer dealers made by far the finest exhibit of vegetables grown in the county. The fruits were excellent, so far as they went, but by far the best were grown out of the county. "G."

(*For other Fair reports see page* 682.)

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

IN THE OLD BARN.

OLIVE E. DANA.

Its doors wide open the farmer throws,
  And in and out the sweet wind blows,
One wide old door looks east, one west;
  One long might ponder which view was best;
For fresh and strong the west winds are,
  O'er the river near, from the hills afar,
And pleasant odors the south winds bring
  From the woods and fields where the wild birds sing;
Fair in the dawning the meadows lie,
  Dark are the hills 'neath the sunset sky.

Many a scent of the woods and fields,
  And the pasture-slopes, the old barn yields;
For field, and meadow and pasture hill,
  Each gives its treasure, its space to fill.
High on the mow, and low in the bay,
  Have willing hands heaped the fragrant hay;
Green and fresh from the swathe new-mown,
  Rank and juicy and breast-high grown.

And the slow stald cows from the uplands bring
  The scent of the woods and their nourishing;
Where the best and sweetest wild herbs grow,
  And which are harmful full well they know.
Patient and placid and kind they wait
  Their turns, if the milker's task is late,
And the creeping shadows dark and still,
  With strange wierd shapes, the old barn fill.

And the gray old barn is sheltering
  Other than these 'neath its ample wing,
The calves and the yearlings frolic and play,
  From the stalls near by the horses neigh,
And among the rafters, cobweb hung
  Where spiders unnumbered have spun and swung,
Where none may venture and none molest,
  The cooing, fluttering swallows nest.

In the gray old barns are hidden away,
  Memories sweet as the fragrant hay;
Of dewy morning and starry night,
  Of summer beauty and autumn blight,
Of the tasks recurring at morn and eve,
  That the web of the farmer's life-work weave,
Of forethought wise and of anxious care,
  Of failing crops and of harvests fair.

A second hearth, to the farmer, is
  The barn with its clustering memories;
Store house and castle, its old walls hold
  Weapons of strength 'gainst the winter's cold,
Tonic and bracing its work and its cheer,
  When frosts are felt, and the days are drear,
And when Summer wanes, the pleasant farms
  Their treasures hide, in the old gray barns.

OF INTEREST TO WOMEN.

The mannish cravats now worn by women are very bright colored, while men content themselves with soberer hues. The dry goods openings display so far few novelties in color. Red is again to be popular; the newest shade being *coquelicot*. The gowns made for this season are of soft neutral tints, gray and brown being preferred. English women have adopted a very useful fashion for autumn country wear, viz.: a loose Garibaldi bodice—they call them shirts now—with simple skirts of contrasting tone. A dark moss-green skirt with a chintz bodice is a favorite and artistic combination. The waistcoat is an invariable adjunct of English cloth gowns, and is seen in every variety of form that the dressmaker can devise. The Princess of Wales wears a frill of white muslin on the front of the open jacket. The fashion of white shirts and white waistcoats under small tailor jackets is very popular among English women. It is very becoming to the figure.

French dressmakers are using watered ribbon largely in trimming. Gray camel's hair is very popular with this decoration. A single costume may be judiciously varied by movable vests, both contrasting and harmonizing. A tucked vest of white linen has a very good effect with a dark gown.

A BRIC-A-BRAC GOSSIP.

Since high art and æstheticism came into vogue a home of any pretensions without bric-a-brac is Hamlet with the royal Dane left out. But a good many people dignify with the name of bric-a-brac a collection of popular miscellanies we scarce can recognize under the title. True, we can't all possess Royal Worcester and Crown Derby, but we need not decorate (?) our parlor with cheap crockery and cheaper chromos until it looks like a tea store arranged by an earthquake. Over-decoration, and that of a tawdry character, is a glaring fault in many households. We have all been in houses where the rooms seemed afflicted with a chronic eruption of crocheted mats and tidies, breaking out on every piece of furniture, and, though a stage higher in culture, the woman who smothers everything in art needle-work is equally reprehensible, since her unlucky visitors are in constant fear of causing her displeasure by injuring her delicate fabric or work.

Still, every woman has a leaning towards fancy work, a fact borne out by the experience of some energetic young women who started an Exchange for women's work, in a small country town. They were inundated with art needle-work which they could not dispose of, because everyone gave her leisure to such work. But the culinary part of the Exchange was a success, because the women who made their own art decorations could not—or would not—make their own pies.

A bit of good china is, in our eyes, the most satisfactory of all bric-a-brac. It may not be "real," but if selected with taste it is always charming. Without taste—well, we see so many porcelain atrocities fondly regarded by their misguided owners that it seems rather a delicate subject to discuss.

Nowadays there are few wares, either in glass or china that are not perfectly imitated, the imitation while equally beautiful, naturally selling for much less than the real article. Both Staffordshire and Greenpoint offer some good examples, in imitations of Moorish porcelain and Limoges *faience*; the latter is most beautiful and very moderate in price. Japanese ware is extremely cheap, and pretty too, if purchased with taste. Then there is odd dark blue Flemish ware, with quaint pictures and Flemish mottoes—all manufactured in the United States. A little well-chosen bric-a-brac of this class, with a plaster cast or two, will give a room more character than an avalanche of art needlework. We do not mean to utterly condemn the latter, but we see too many girls neglecting the solid graces of good housewifery and the less tangible graces of mental culture for such work, until art embroidery becomes a delusion and a snare to all such foolish virgins.

CHEERFULNESS AND AMIABILITY.

"A merry heart makes a cheerful countenance," but there is little virtue in the latter, when one has so good and sufficient cause for it as a merry heart. To hide an aching heart under a cheerful face is indeed heroic. A sort of heroism, too, that of which women have almost a monopoly, as, indeed, they need have. A man can still his heartache by a closer attention to business; by contact with the busy, bustling world; a woman must suffer and be silent.

"Power," says the Concord philosopher, "dwells with cheerfulness." This, like all the gems from the pen of Emerson, is full of deepest thought and meaning. It is especially applicable to the indoor life and work of women. Ernest Renan, in his "Recollections of youth," speaks of his mother as one always very ready to laugh. What mother has not found out that seeming folly is often the truest wisdom? It is not enough to laugh with our children when they are babies. Send them to school bright and happy, with a smile and a cheerful kiss. Children of all ages have a troublesome fashion of getting out of the wrong side of the bed, as my grandmother used to say when I was particularly cross and fretful. It is at such times that a mother must cultivate the calm power of which Emerson speaks and pour oil on the troubled waters.

Cheerfulness and amiability are greater conducives to beauty than all the rouge and cosmetics that were ever invented. They can be cultivated just as well as any art or accomplishment. Even under ordinarily adverse circumstances, sunny looks and smiles and kind words cost only a slight effort, that with habit will cease to be effort. This power once acquired keeps the heart young and makes the oldest and plainest faces beautiful. Like beauty, it is very often a heaven-sent gift, but unlike beauty, even though not to the manner born, you may still become the possessor of it. Think of it, wives and mothers before habitual peevishness and fretfulness have irrevocably left their lines upon your faces. E. S.

SELF-SUPPORTING GIRLS.

An exchange asks, "Does it pay to be a woman?" and proceeds to point out that it decidedly does not pay, in view of the fact that there are so many more women than men that it is quite impossible for every woman to find a husband, and that they are paid so much less for their labor than men. Still one's sex is something outside of one's own volition, and perhaps our contemporary would agree with us that the next best thing to being a man is to be a self-supporting woman.

A boy is educated from his babyhood to be self-reliant, and with the idea always in view that he must carve his own way in the world, while our girls are thrown helpless upon the world without any preparation to enable them to fight its battles. We have frequently heard young ladies deplore the fact that if they were left dependent there was nothing they could do to enable them to earn the price of a single meal. Somewhere our schools are at fault for this state of things. There is too much learning of a little bit of everything and not much of anything. Master one thing thoroughly, and I do not care what it is, let it be only the ability to darn beautifully, and if worst comes to worst, so that you can but do one thing better than most other people can, you will find exercise for your talents that will at least keep you from misery and want.

Clerical work of all sorts, business of many kinds and nearly all the professions are now opened to women. Twenty years ago the range was much more limited; there were few women clerks comparatively speaking, and few if any women employed as book-keepers and office clerks. A girl had small choice between teaching, dressmaking or house service. To-day women are proving that they make equally as good clerks as men, are quite as accurate in figures, and in many cases are gaining the reputation of being more obliging and faithful. Their services are beginning to be recognized, and paid accordingly too. It is no uncommon thing for a feminine stenographer to receive from $100 to $150 a month. To do this, however, she needs not only to be a very rapid writer, but to have great powers of endurance. There are few women who attain a high rank in this profession for want of the latter, but a limited knowledge of it such as any ambitious girl may acquire in six months will enable her to command from $30 to $75 a month according to the demand. What girls require, whether in the household department or in any employment, is thorough practical drill. Nothing can displace a technical education and a well-served apprenticeship in any business.

It is contended by some that this unfits women for a domestic life. There are some women who never under any circumstances would be fit for it: to such it opens an avenue of escape from it, but a woman who has the true instinct of womanhood will turn to love and maternity should these come within her reach as surely as the sunflower turns to the sun, while should these delights not be given to her, she will be saved from that worst of slavery, marrying for the sake of a home.

A WORKER.

GOLDEN GRAINS.

The more believers love God, the more they love one another; as the lines of a circle, the nearer they come to the centre, the nearer they come to each other.—*Charnock*.....

There is no knowledge for which so great a price is paid as a knowledge of the world; and no one ever became an adept in it except at the expense of a hardened and a wounded heart.—*Countess of Blessington*.....

Christian faith is a grand cathedral with dimly pictured windows. Standing without, you see no glory nor can possibly imagine any; standing within every ray of light reveals a harmony of unspeakable splendors.....

It is no small or trivial matter when the day is ended to put the head upon the pillow with the consciousness that during the day no wrong deed has been done; and when life is closing in, and the last days are rapidly running out, the thought must be inexpressibly sweet that no dishonor taints the name that is held so dear.....

Never get discouraged because things get on so slowly here, and never fail to do daily that good which lies next to your hand.....

A judicious observer has said: "The longer I live the more I am certain that the great difference between men—between the feeble and the powerful, the great and the insignificant—is energy, invincible determination, a purpose once fixed, and then death or victory. The quality will do anything that can be done in this world, and no talents, no circumstances, no opportunities will make any one successful without it."....

Self-denial is the most exalted pleasure, and the conquest of evil habits the most glorious triumph.....

Domestic Economy

A HANDY BOX.

Fig. 386 shows a box that is very convenient to have in a kitchen. It is 13 inches long, nine inches broad and eight inches high.

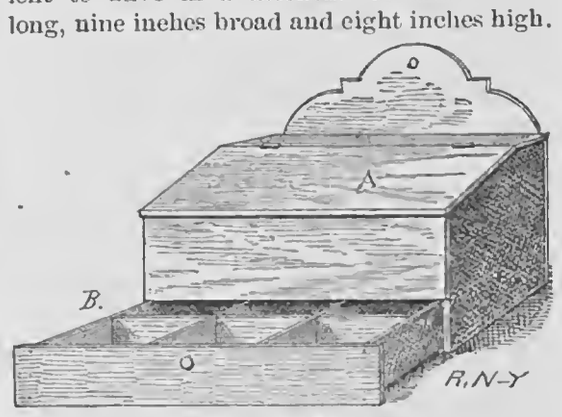

Fig 386.

The upper part forms a salt box of which A is the lid. The drawer, B, in the lower part, is divided into a number of apartments in which are kept spices and other articles of household use. S. P. SHULL.

THE POSSIBILITIES OF A MUTTON CHOP.

"MUTTON IS THE MOST NUTRITIOUS AND DIGESTIBLE OF MEATS."

While mutton is emphatically the poor man's meat, it is not scorned by royalty itself, Queen Victoria's favorite dish being boiled mutton and caper sauce, as it was that of her royal progenitor, George III. Charles II, after the fatal day of Worcester, was glad to get it, and in a manner as unscrupulous as that by which kings frequently obtain what they desire. One of his followers, as we read, enters the sheep cote of a farmer, "chooses of the best sheep, strikes him with his dagger and sends a servant for it, who brings it to the king on his back." Without waiting until the meat gains sweetness by "hanging," the king the next morning calls for a knife, and cutting some collops from the leg, fries them in a pan over the fire for his own breakfast. It is probable that in Charles a good cook was spoiled to make a poor king. Lord Bolingbroke had a fondness for mutton broth, while Ben Johnson was a noted lover of mutton as well as of tea. Dean Swift was partial to mutton pie, and eulogized roast mutton in verse. I do not know if poets are especially subject to indigestion, but one would suppose so from Goldsmith's lines:

"To poets who venison seldom can eat,
  Your very good mutton's a very good treat,"

As indeed it is when cooked by an artist.

But let us return as to the cooking of our mutton chops. They are delicious grilled and need no other accompaniment than a mealy, baked potato. They should be cut from the best end of the neck or, better still, from the loin, fully three-quarters of an inch thick, if loin chops; shorten the bones and trim off most of the fat. Make a mixture of one beaten egg, bread-crumbs sifted, parsley chopped until it is almost powder, a little powdered thyme, salt, pepper and nutmeg. Brush the chops over with melted butter and cover thickly with this mixture. Wrap them carefully in white paper, place them on a clean, hot gridiron, and broil over a clear fire, turning frequently. They will require from eight to ten minutes. Remove the paper and arrange them on a hot dish with a bit of butter under each. Have mushroom catsup on the table. Use a double broiler, or turn the chop by seizing the trimmed end of the bone deftly and giving it a quick turn, but do not stick a fork into it, or the juices will escape.

Stewed chops should first be broiled for two

minutes over a bright fire; then place them on a sheet of clean blotting paper to free them from grease. Put into a stew-pan a large tablespoonful of butter, three medium-sized onions sliced, and a half teaspoonful of salt; lay the chops on this, cover closely and stew gently, without the addition of water, until they are tender and the onions thoroughly cooked. They are capable of being served in many ways. Put a mound of nicely mashed potatoes in the center of a dish, lay the chops around the base and send the gravy, to which you have added a spoonful of good tomato or mushroom catsup, to the table in a boat. Green beans or peas may be substituted for the potatoes, or boiled rice with a spoonful of curry powder may be added to the gravy.

Few cooks do justice to a breaded chop. The general idea that it must be fried by immersion in hot fat is an erroneous one. It may be *sautéed* provided sufficient care is taken not to let the breading scorch. Dip each chop first in beaten egg and roll in fine bread crumbs, have your pan very hot, with a little very hot fat in it. Lay in the chops, place over a rather slow fire (a little practice will enable you to determine just how hot the fire should be), and turn frequently. They will require from ten to twelve minutes in the process. Season them with salt and pepper just before they are done, and serve them on a very hot dish. Mutton cooked in any way, if it is intended to be served hot, should be *very hot*, and if cold it must be very cold.

If you will try mutton cutlets a *la milinaise*, and not allow the high-sounding foreign name to frighten you, you will find them a very simple and delicious dish. Trim the cutlets or chops, and bread and fry as above. Before this is begun however put some macaroni on to boil so that it will be done about ten minutes after you begin to cook the chops. Put it on in salted boiling water, and when both are done, drain the macaroni, pile it on a hot dish, sprinkle two tablespoonfuls of grated cheese over it, lay on a piece of butter the size of an egg, season with salt and pepper and toss with two forks until the butter and cheese are melted, and the seasonings thoroughly melted. Arrange the cutlets around the base, and you will agree with Uncle Sam Ward that they "might make an ascetic play the glutton." PALMETTO.

EXTRACT from a private correspondent at Bear Lake, Manistee Co., Mich.

What bitter experiences have we passed through since I wrote you last. I think I told you something of the drought and of the destructive forest fires that were near us. First our beautiful grove surrounding the house and grounds was set on fire by a mischievous, half-witted boy, and as the drought still continued the fires continued to spread in spite of all our efforts to stop them. Meadows and pastures were blackened by the flames; miles of fence destroyed; then our commodious barn, containing a large quantity of hay and grain, machinery, sleighs, cutter, harness and tools of all sorts was burned, and two days later the house with a good part of the contents, all were sacrificed to the fiery demon. Oh! it was terrible to see the work of our hands torn from our grasp and scattered to the four winds. It seems like a terrible dream, when I think of it, and that I must awake, but it is only too true. It might have been worse, for our lives were spared, and we were insured, though nothing near to what the losses were. For the first two or three weeks I had neither strength nor ambition to do more than exist. We were all exhausted with the work of trying to stop the fires.

But we have finally taken up the thread of our lives and have gone about our work again. We were obliged to settle down in the village, five miles away, there being no vacant dwelling-house near the farm. So "the men folks" take their dinners with them, and I try to get used to village life and entertain callers, when I want to be about the 99 important things that seem necessary to be done. I expect to learn many lessons. MAY MAPLE.

CARPET BEETLE REMEDIES.

PROF. A. J. COOK, of the Michigan Agricultural College, recommends the following remedies for the destruction of the Carpet Beetle or "Buffalo Moth," as it is often called:

First, he would recommend ironing wet cloths placed over the affected part of the carpet, using flat-irons that are very hot. The cloths may be two or three thicknesses of common toweling, wrung out of water just so they will not drip, then iron till dry. To secure the best results one ought to have a dozen or more irons. He has found that this thoroughly done is most deadly to the carpet moth larva, and surely the intensely heated steam penetrating every fiber of the carpet, and to every crevice of the floor, must sound the knell of every larval carpet beetle that feels its deadly presence. He has tried this on delicately tinted carpets, and while it was delightfully efficient in destroying insects, it did no injury whatever to the carpet. The only caution here then is to make thorough work: *be sure of a full head of steam.*

Another remedy of which he says he should feel quite certain would be to brush, by use of a paint brush, the floor under the carpet with a strong solution of corrosive-sublimate, the bi-chloride of mercury. This should be made as follows: Four parts (by weight) bi-chloride of mercury, one of chloride of ammonia (sal-ammoniac), and 50 parts water. This is surely fatal to bed-bugs, Cimex lectularius, and certainly these carpet beetles can hardly be possessed of more lives than are the bed-bugs. The objection to this remedy is the virulency of the poison. Of course, with care there is no danger; but so many of us are by nature and practice so culpably careless that to have such a poison in the house is hardly safe.

He also has reason to believe that tarred paper under the carpets, napthaline, the crystals of naptha, kerosene oil or gasoline would each and all kill the insects if freely used under the carpets. There are two objections to their use. They are all more or less offensive as to odor, while the last two, from their inflammable nature, might do great harm. He has used the napthaline with marked effect. And although it does scent a room thoroughly it could be removed after effecting a cure, and the carpet and room be so aired as to greatly lessen this objection. Kerosene would surely kill all insects that it touched, but its tendency to stain the carpet, and its persistent odor might be considered serious objections to its use. Gasoline—much better than naptha, as it never stains and quickly evaporates—is also a sure cure, and great caution to thoroughly ventilate before any fire is brought near would render its use safe. If used thoroughly in a house, no fire should be allowed even in a distant room till thorough ventilation, as shown by the absence of the characteristic odor, had removed all the explosive vapor. As an accident by the use of gasoline might be most terrible it should only be used with the greatest care.

In case furniture is infested, the free use of gasoline would be the safest and surest remedy. In this case, the articles to be treated could be removed to an outbuilding, and should not be returned to the house till the liquid had thoroughly evaporated.

Woolen garments not in use may be protected by putting them in perfectly close boxes. As the insects are so small we could not be sure that they were excluded except that we paste paper over any crack, as where the cover meets a box or trunk.

In such close quarters, camphor gum, which keeps clothes moths away, is said to make no impress upon these beetles. The Professor believes napthaline, which he is told not only keeps the Dermestes lardarius (Bacon beetle) away, but actually destroys it when once at work, would also serve to protect against the carpet beetle. The trouble with this would be the persistent odor. Yet it is possible that if it should be closely wrapped in a cloth it would still keep the beetles out, and yet would not so scent the clothing that it would not soon pass off upon exposure.

If clothing should become infected it could be put into a close box and drenched with gasoline. As soon as the insects were killed the clothing could be aired, when the odorous liquid would quickly escape. Bisulphide of carbon could be used in the same way. This is deadly to all insect life; but it is fully as explosive and dangerous when fired as is gasoline. So if it is used we cannot be too cautious.

HAIRPIN RECEIVER.

THIS pretty and useful little article will require very little time to fashion. Crochet in a shell pattern, of macramé cord, a cover to fit a small tin box of any shape, stiffen it with cold starch; when dry it may be gilded. Or it may be made of the colored macramé. Make a knitted top of zephyr by knitting every other row plain, and the alternate row by winding the zephyr around the first finger four times and knitting it in. Fill the box with curled horsehair, and fit it over.

LAMP MATS.

HANDSOME lamps have become so much the fashion that it is almost a matter of necessity to have mats, for if a table has a polished surface it will be scratched and marred by the lamp, and a handsome cover will also be soiled by it. Take four shades of zephyr; olive browns or reds are pretty. Knit in plain garter stitch a strip three yards long and 18 stitches wide, using medium-sized needles. This should then be dampened and ironed; one edge cut off and ravelled out to within a quarter of an inch of the other one. Cover a piece of pasteboard nine inches square with some woolen stuff to correspond or contrast prettily with the knitted edge, and sew the ravelled strip on in rows beginning on the outer edge with the darkest color. Lap each row over sufficiently to hide the edge of the previous row. H. M.

ELSIE BEE says in the Jeweler's Circular that with the revival of other old time favorites it appears possible that cuff pins will again come into general use. That there is a necessity for these or some similar contrivance every lady who wears linen cuffs can testify, and the wonder is that so needful an article was ever dropped. There are few things more trying to the feminine temper than the shooting out of a stiff cuff over the hand, and the jagging into the flesh of a pin point with every sudden movement of the arm.

THE new advocates for favor in form of cuff pins are fashioned after the old models, which of late years have figured in stock under the name of "baby pins," because used for the purpose of keeping in place infant's bibs and little peoples' collars. The chief difference between the new and old cuff pins is that the former is bent a little so as to present a slightly convex surface that fits the curve of arm and sleeve. All gold cuff pins are in the show cases this fall: some are chased, some are finished in enamel, and others are formed of twisted wire or rope pattern. The fact that the cuff pin, like the old bar pin, is a utility affair, serves equally well for lace, bonnet and ribbon ornaments, when not required for confining the cuffs in place, is a big argument in its favor.

DOMESTIC RECIPES.

MRS. L.'S JELLY CAKE.

"I HAVE a way of my own for making jelly cake," said Mrs. L——, as she went about preparing things for supper, "and I'll make some while you are here and see if you do not pronounce it good."

While she was getting the materials together, I hunted up a bit of paper and my pencil and was ready to jot down the recipe as she directed.

"I put a cup of flour into the dish in which the cake is to be mixed, and stir in a teaspoonful of baking powder. Now I add three-fourths of a cup of sugar and two eggs; then I go to a pan of milk with my dish and dip off about five spoonfuls of sweet cream, then get a lump of butter the size of a hickory nut, and put in with the other ingredients, and then stir all together and put into the tins, and bake quickly. Flavor to taste."

When baked I found it excellent, and have since tried the rule, and found it easily made, and a success. She also gave me several other recipes, the following among them, which she prized very much:

SUPPER CAKE.

Break two eggs into a teacup and fill up with sweet cream; add one cup of sugar, one and one-half cups of flour, one heaping teaspoonful of baking powder, stirred into the flour, and one tablespoonful of butter. Mix all together and bake.

CORN STARCH CAKE.

Two cups of powdered sugar, one cup of butter, three-fourths cup of milk, the whites of six eggs, three-fourths of a cup of corn starch, two cups of flour, three tablespoonfuls of baking powder mixed into the flour; flavor with lemon. Very nice. MAY MAPLE.

PINE APPLE AU NATUREL.

Pineapples have the name of being indigestible, but if prepared as follows they will be found quite innocent in their effects. Cut the base from a sound, ripe pine. Take a long, narrow, sharp and pliable knife and run it down within a quarter of an inch of the outer side of the rind. This will loosen the fruit from the skin which should then be lifted out. Now run the knife down the core and remove the latter which will leave a hole or cavity through it an inch in diameter. Fill this with white sugar and place it on a dish, base down. Replace the shell of rind and set away for a few hours in a cool place. Bring to table the apparently untouched pine, lift off its plumed cap, and you will find it mellow, tender and delicious, and the dish brimming with a liquid like veriest nectar. A. G.

OAK floors are best for kitchens.

Have you tried salting down string beans for winter use? Treat them as you would cucumbers. When wanted take from the brine, freshen, then cut and cook as you would those just picked from the vines.

See to it that your napkins don't smell of soap.

How many of our readers have pleasant kitchens?

Clergymen

Lawyers, Actors, and Singers, are often troubled with loss of voice, resulting from a slight cold, weakness of the vocal organs, or inflammation of the throat, and in all such cases may be promptly relieved by the use of Ayer's Cherry Pectoral.

I would not be without Ayer's Cherry Pectoral on any account. It is an invaluable remedy in Bronchitis and Lung Complaints, and speedily relieves Hoarseness or Irritation of the Throat, caused by public speaking.—Rev. E. Bethune, Jamesville, Tenn.

I have been so much afflicted with Bronchitis that I should be unable to perform my clerical duties without the use of Ayer's Cherry Pectoral.—A. G. Kirk, Pastor Baptist Ch., Hillsville, Pa.

Ayer's Cherry Pectoral,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

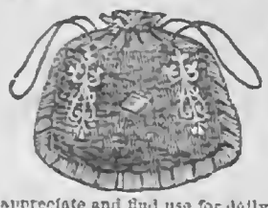
SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

FRIENDS, IF YOU ARE IN ANY WAY INTERESTED IN

BEES OR HONEY,

We will with pleasure send you a sample copy of the **Semi-Monthly Gleanings in Bee-Culture,** with a descriptive price-list of the latest improvements in **Hives, Honey Extractors, Comb Foundation, Section Honey Boxes,** all books and journals, and everything pertaining to Bee Culture. No THING PATENTED. Simply send your address, WRITTEN PLAINLY, to A. I. ROOT, MEDINA, OHIO.

LADIES' PLUSH SATCHEL FREE!



The beautiful Ladies' Hand Satchel shown in the annexed illustration is made of fine plush, with nickel-plated trimmings and silk cord handles. Ladies will find it very handy and useful for carrying small articles when going out calling or shopping; it likewise answers the purpose of a pocket book, and is an article which all will appreciate and find use for daily. We publish **The Cricket on the Hearth,** a large 16-page, 64-column Illustrated Literary and Family paper, filled with the choicest reading matter for the family circle, and being desirous of increasing its already large circulation to 100,000, we now make the following *wonderfully liberal offer:* Upon receipt of only **Thirty-Eight Cents,** we will send **The Cricket on the Hearth** *for* **Four Months,** *and to every subscriber we will also send,* **Free** *and post-paid, the handsome* **Ladies' Hand Satchel** *above described.* Remember, the Satchel costs you nothing; it is given *free* as a premium with the paper. This is a rare opportunity and a great bargain. Send without delay. Postage stamps taken. As to our reliability, we refer to any publisher in New York. Address,
S. H. MOORE & CO., 27 Park Place, New York.

MELLIN'S

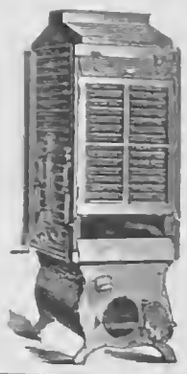
TRADE ORA ET LABORA MARK.

FOOD

FOR INFANTS AND INVALIDS.
The only perfect substitute for Mother's Milk. The most nourishing diet for invalids and nursing mothers. Keeps in all climates. Commended by physicians. Sold everywhere. Send for our book "The Care and Feeding of Infants." Sent free.
DOLIBER, GOODALE & CO., BOSTON, MASS.

WANTED A WOMAN

of energy for business in her locality. Salary $50. References, E. J. Johnson, Manager, 24 Barclay St., N.Y.



THE PNEUMATIC
FRUIT DRIERS.

Made in ALL SIZES for farm or family use.

At the test of the leading fruit evaporators, at the Penn. State Agricultural Society at Phila., Oct., 1885, the "PNEUMATIC" dried a barrel of pippins in 50 minutes less time than the AMERICAN. The ZIMMERMAN was distanced, and withdrew before finishing.

HOME NEWS.

SATURDAY, Oetober 2, 1886.

THE Industrial Exhibition of 1886, just finished at Toronto, was the most suecessful ever held there. Total gate reeeipts $43,914, as eompared with $34,126 last year.... ..... Forty miles of that railroad from Winnipeg to Hudson Bay are soon to be built, the neecssary funds having already been raised in England. Recent researehes go to prove that ice blocks navigation in Hudson Bay nearly the year round, so that the prospects of transporting freight by water direct from the railroad terminus to Europe are not encouraging; but much of the land along the line is valuable for its agrieultural and mineral resources..... ...."Every vestige of revolution has disappeared" in Mexico, with the slaughter of a number of bandits and ehronie revolutionists, who were in the habit of issuing "pronuneiamentoes" whenever there was a good chanee of robbing under the guise of making forced loans..... Gironimo and his followers are still held at San Antonio, Texas. Gen. Miles reports that they were not captured, but that they surrendered on condition that they should not be turned over to the civil authorities of Arizona, and that their lives should be spared. Hence they were at once removed from the Territory contrary to instruetions from the War Department—to confine them at the post nearest the place of capture. The Government had positively instructed Miles that nothing but capture or unconditional surrender should end the Apaehe eampaign. Cook, it is said, could have secured a conditional surrender six months ago.....Cutting estimates his "pecuniary losses, and his mental and physical suffering" as entitling him to an indemnity of $50,000 from Mexieo..... .....The Government reeeipts during the month of September were about $32,000,000, and the expenditures abont $18,000,000, making an excess of about $14,000,000. It is estimated at the Treasury Department that there has been a decrease of nearly $11,000,000 in the public debt during September.....Mrs. Cleveland and Mrs. Folsom have gone to Buffalo, N. Y., for a visit of about 10 days:.....The managing Committee of the American Purchasing and Leasiug Company (whisky pool) has advanced the price of whisky from $1.12 to $1.13—a eompromise between the views of the Cincinnati and Peoria distillers ....Ever since the Prohibitionists carried Atlanta, Ga., last November, there has been a fierce agitation, in which the Prohibitionists always came out ahead till last Tuesday, when they were "utterly swept out" in a "primary election for the State Legislature," by the Anti-Prohibitionists under the name of Conservatives–1,000 majority out of a total vote of 4,700. It was claimed that Prohibition seriously damaged the trade of the place, drove many business firms away, and greatly increased taxation..... .... . The great assembly of the Knights of Labor will be held at Richmond, Va., October 4. The colored delegates have been refused aecommodations by every hotel in the city, and the Knights—some of them—are highly indignant. Here seven Chinamen sought admission into the order; but there was no opening for Mongolians.....New Public Printer Benedict has made 725 removals in the government printing office in Washington—100 of them women from the folding room. As many more are to be made, says B .....A grand national competitive drill for military organizations at Washington next May, open to all arms—$25,000 in prizes.....Henry George, land right and labor agitator, has been nominated for Mayor by the labor organizations of this city..... ....Bonanza Mackay, chief owner of the "commercial" cables to Europe, hopes to ereate out of the Postal Telegraph Company a system as extensive as the Western Union, and predicts that in doing so he will reduce rates to such an extent as to do away with business letter writing, inside of three years. .....A Judgeship of the Court of Appeals is the highest elective office to be filled in New York State this year. Efforts were made to unite both great parties on one man; but the Republicans have nominated Charles Daniels, who has been on the bench of the Supreme Court ever since 1863—23 years; and the Democrats have nominated Rufus W. Peckham, who has been on the same bench since July, 1884—two years and two months. Both excellent nominations.....The total number of immigrants arrived at the different ports of the United States during August, 1886, were 33,366, against 26,214 during the same month of 1885, an inerease of 7,152. During the eight months ended August 31, 1886, there arrived 254,679 immigrants, against 140,917 for the same period of 1885, an increase of 13,962. The bulk of the immigrants were from Great Britain, Germany, Sweden and Norway..... ....A call for $15,000,000 of the three per cent. bonds of the series of 1882 was issued Monday. .....Arresures' family asks $100,000 indemnity of the Mexican Government.....The Dakota Republiean convention demands "the immediate reduction of the Indian reservations in the Territory," and blames Congress for not "opening to settlers a portion of the Sioux reservation".....Governor Foster, of Ohio, is out of polities, he says, and into natural gas as the agent of a eompany of whieh the Standard Oil Company owns two-thirds of the stoek put at $3,000,000. It is proposed to pipe the gas from the wells at Findlay to Toledo—25 miles .....Justin McCarthy, the famous Irish author, historian and political leader, reaehed New York Saturday afternoon, after a short passage from London on the steamer Britannia. He will lecture through the eountry on the Irish question.....John F. Swift, Republican candidate for Governor of California, refuses a place on the ticket of the "American or Know-Nothing Party." He doesn't want any connection with a ticket that brands the Romau Catholics as hostile to American institutions..... ....The proposed raee between the Mayflower and Galatea off Marblehead in a genuine "cutter breeze" has been declared off. The yachts have been loafing there a week waiting for the wind which has failed to come, and the Mayflower has now gone into winter-quarters .....Several members of the late Board of Public Works of Cincinnati have been arrested on charges of embezzlement ....Mrs. H. B. Stowe, aged 75, says her health is rather poor, but not "shattered" as reported.....There will he a National Convention of distillers, brewers and wholesale and retail rum-sellers at Chicago Oct. 18, "to eheck the growth of public sentim nt hostile" to the whisky trade.....Senator Edmunds has gone to Boston on his way to the British Maritime Provinces to investigate the fish question. A report that a treaty settling the matter and establishing favorable trade relations between the Union and the Dominion was telegraphed from Ottowa last Sunday; but proves to have been bogus news; and the senders are to be prosecuted by the Canadian Government.....John Esten Cook, the author, died at his home in Clark County, Va., last week, aged 56 years..... ..A terrible gale and rain-storm along the Texan coast in the vicinity of the mouth of the Rio Grande River last week caused great damage and distress. It lasted three days, beginning Tuesday. Two hundred houses in Brownsville, Tex., were blown down and 150 families are homeless and in want. In Matamoras over three huudred houses were leveled, many persons injured and 400 families turned out of doors .....The Inman Steamship Company's line between this port and Liverpool is reported to have been purehased by the Pennsylvania Railroad Company. It will continue to run on the usual course, but nnder the management and in the interest of the road. Three fine new steamers are to be added to it.....

FOREIGN NEWS.

SATURDAY, Oct. 2, 1886

Peaee or war? That's the absorbing question in Europe just now, and the decision depends on Berlin. Gen. Kaulbars demands in behalf of Russia, the raising of the state of siege in Bulgaria so that the Russian adherents may be at liberty to agitate in favor of Russian domination; the liberation of all political prisoners, so that all who have been confined for conspiracy against Alexander and in favor of Russia may be able boldly to repeat the offense; and the postponement of the elections for the National Assembly which is to elect a new Prince. This is required to enable the Russian adherents to agitate and intrigue before election. Kaulbars has been carrying things with a masterful hand, forbidding proclamations by the government and making others himself in favor of Russia. He has several times threatened that in certain contingeneies Russia will occupy the country. The Bulgarian Regency has been returning conciliatory but firm answers — they will comply with the Czar's demands as far as they can consistently with the honor and independence of the country. M. Tisza, the Hungarian Premier, declares that Austro-Hungary firmly adheres to the Berlin treaty, and will resist any attempt of any single power to establish a protectorate in Bulgaria. Austria, urged chiefly by Magyar hatred of the Slavs, is taking a firm stand against Russian encroachments, and it is supposed that she has an understanding with Germany in the matter. England is strongly backing her up. Turkey is massing troops on the frontier of Eastern Roumelia as if about at once to start a campaign. Russia has vast masses of men in Bessarabia ready to move south at an hour's notice. Altogether the outlook in Europe is decidedly warlike. The great age and peaceable disposition of the German Emperor, and the vast commercial interests involved are the only checks on an immediate outbreak of hostilities. Will war be deferred till Spring?....

AGRICULTURAL NEWS.

SATURDAY, Sept. 25, 1886.

The distillery cattle at Chicago are strictly quarantined under the supervision of the National Bureau of Animal Industry. Half a dozen of the best veterinarians in the country have charge of them. All agree the disease is contagious pleuro-pneumonia. The slaughter of the herd is deferred because no decision has hitherto been reached as to what shall be done with the carcases. Miller & Armour offer to take the entire lot of quarantined stock, numbering about 2,400, kill them under the charge of the official veterinarians and send the healthy carcases to market and the diseased ones to the rendering establishments. Dr. Salmon is inclined to accept the offer, but the large cattle dealers object. They can hardly afford to have the reputation of Chicago beef injured by such a sale, and it is thought that rather than have the offer accepted they will raise the money to pay the owners for all the suspected stock and have them killed and buried. There are numerous reports of outbreaks of the disease in various other parts of the country from Dakota to Virginia, nearly all attributed to importations of stock from Chicago. Indiana, Michigan, Wisconsin, Iowa, Missouri, Kansas and Colorado have already scheduled Illinois, so that no cattle from that State can be imported into any of the others without a certificate of sound health from the official veterinarians. Other States are likely to follow the example. There is a genuine scare among the whole cattle interests of the West, and protests, objurgations and "resolutions" are the order of the day.... .....In 1876 we imported 4,903,771 dozen eggs; in 1885, 16,098,450 dozen, according to the Bureau of Statistics. Eggs are on the free list; shall imports of foreign "hen fruit" be taxed; or shall the egg-laying business be increased at home?. ....

FROM 20 to 25 Canadian Pacific cars loaded with buffalo bones arrive at Fort Benton, Montana, every week, consigned to fertilizer works in the East, and the business is increasing. The bones are picked up scattered over the prairies, chiefly along the water holes and courses.....The proprietor of a grain "bucket shop" in Montreal has been convicted of keeping a common gambling house, and sentenced to a fine of $200, and to find $1,000 bail "to keep the peace" for one year. It would be a blessing if the same fate befell all the "grain offices" in the States..... .. .Last year 10,000 American cattle—chiefly from Montana—were handled by the Canadian Pacific R. R., and the number is expected to be much larger this year. First shipment —20 car loads—was made the other day from Maple Creek, Manitoba, having been driven across from Montana. They were shipped through in bond.....The exports of live stock and dressed meats from the port of Boston for the foreign markets last week were 1,467 cattle and 1,180 quarters of beef..... .....English cattle markets are very heavily supplied, and best American steers are weak at 11½ cents per pound, estimated dressed weight.....The latest figuring gives Australia 74,913,407 sheep. The average weight of fleece is stated at five pounds per sheep "in the grease," and of washed wool, two and a half pounds per fleece..... .....Concerning cattle diseases in that portion of India known as the Madras Presidency, a Calcutta paper says: Last year the total number of deaths was returned at 43,788, of which 12,057 are attributed to rinderpest, 11,226 to anthrax, 5,208 to dysentery, and the remainder to other diseases.....Colorado has 800 miles of first-class irrigating canals, 3,500 miles of secondary canals and 40,000 miles of smaller ditches, which have cost in the aggregate about $11,000,000 and will irrigate 2,200,000 acres... .....The new oleomargarine tax stamps will be ready for general distribution about the middle of this month. .....Hog cholera is spreading in Northwestern Virginia and there are fears of an accompanying epidemic of fever among the people ....The four veterinary surgeons recommended by Professor Salmon to Commissioner Colman for appointment to assist in investigating the pleuro-pneumonia among cattle in and about Chicago are, Drs. Alexander Murray, Michigan; W. H. Rose, Washington; M. R. Trumbauer, Illinois; L. J. Herr, New York.....Farmer Meir went into his pasture wearing a red shirt. A young bull, usually gentle, saw the shirt and went for it, and, although Meir defended himself vigorously with a hoe, the animal killed him..... .....The National Bureau of Animal Industry is investigating the disastrous outbreaks of hog cholera in Indiana and Illinois. Thousands of swine are dying daily, and in some counties droves have been swept away. The death of several at the Indiana State Fair at Indianapolis, early in the week, from a disease supposed to be cholera almost broke up the show in that department.....A dog, bitten by a rattlesnake in Nebraska, instead of dying, developed hydrophobia, and bit fourteen head of cattle, all of which died..... ....There is a loss of about $4,000 from the New York State Fair; but all premiums—amounting to $9,800 in money and $200 in medals—have been paid in full, and the Agricultural Society has still cash on hand from previous good years. Those who bought privileges have lost pretty heavily, owing to the slim attendance, due chiefly to bad weather.. .....The Russian Government intends to establish a tobacco monopoly in the empire. Foreign cigars will thereby be greatly cheapened, as the present enormous duty will be abolished.....Two boys, Brown and Wood, aged 13 and 14, have been arrested in Seavalla County, Texas, charged with murdering a Mexican herder and then killing 60 sheep just for fun.....A short time back St Louis tried unsuccessfully to become a great wool market. Now Chicago is trying pretty successfully to be one. Almost all the Eastern wool firms have agents or branch offices there now. Manufactories of wool have greatly increased in the West of late. There are now over 600 west of the Alleghanies. ....

Vice Consul Touhay, in concluding a report to the Department of State upon agriculture in Italy, says the grain growers in that district are reduced to a desperate condition by taxes, high rates and, above all, by competition from the United States. ....

Crops & Markets.

SATURDAY, Sept. 25, 1886.

According to the last census, the total amount of broom corn produced in this country in 1879, was 27,480,816 pounds or 13,740 tons, a fairly good crop. Of this amount Illinois produced 11,683,018 pounds; Kansas, 5,683,018 pounds; Missouri, 3,159,466 pounds; New York, 2,926,742 pounds; Nebraska, 1,751,807 pounds; Ohio, 1,504,165 pounds; Iowa, 1,169,967 pounds; Indiana, 430,159 pounds, 22 other States and Territories producing the rest, and 17 producing none at all. The area under the crop has been very considerably increased since 1879. Last year's crop is estimated to have been about 18,000 tons, and about 4,000 tons were carried over from the crop of 1884, making an available supply of about 22,000 tons.

A corner in the product last Spring greatly increased the area planted; but owing to a scarcity of good seed, farmers in their anxiety to get in a crop, used worthless seed—sweepings, screenings, etc., and hundreds of acres failed entirely, or were too poor to pay for harvesting. Here is the latest estimate of this year's crop, according to the Chicago Tribune:

State.	Acreage.	Number acres to ton.	Total product tons.
Illinois.....	32,000	4	8,000
Kansas.....	66,000	10	6,600
Nebraska.....	15,000	5	3,000
Missouri.....	15,000	10	1,500
Ohio.....	4,000	4	1,000
Texas.....	2,000	5	400
Tennessee.....	3,000	5	600
Iowa.....	3,500	7	500
Mohawk and Schoharie Valleys, N.Y.	3,500	7	500
Totals.....	144,000	..	22,100

It is thought that 1,500 tons of last year's crop was carried over into 1886, giving an available supply of 24,000 tons this season. The annual consumption is about 20,000 tons, so that there seems to be a surplus of 4,000 tons.

The Illinois crop is the best; but in all the States the length of the spikes or grass is so much greater than usual that much will cut to waste in the manufacture of brooms. Owing to this cause, it will not, probably, average over 80 dozen brooms to the ton. Two-thirds of the crop is thought to be in this condition, and every pound of waste will have to be made up from other corn; the corn, too, is considered heavier than usual, so that a good deal of the above aggregate weight will be useless for manufacturing purposes. The crop has matured unusually early this year; but hitherto receipts have been unusually small, owing to low prices. Farmers believe prices will be higher, and that manufacturers have formed combinations against them; while the latter say they will be lower still. In many places growers are holding for $150 a ton. During the corner in Spring many lots sold for 12 cents per pound; now the market is dull at five cents. Chicago is the greatest broom corn market in the world, handling five times as much as Philadelphia, which comes next. The largest broom factory in the world is that of Samuel Cupples, of St. Louis, Mo.; the next largest that of J. D. Blood & Co., Amsterdam, N. Y., and the next that of Henry Herrick, of the same place. The largest in the West, outside of St. Louis, is that of the Chicago Broom M'f'g. Co., Chicago.

From the proceedings of the 17th annual convention of the Cranberry Growers' Association, held at Tom's River, N. J., the other day, the crops of the last three seasons, as finally determined by their movement, and the crop of the present year, as estimated from the reports received, are, in bushels as follows:

	1883	1884.	1885.	1886.
New Jersey.....	118,521	121,618	198,125	277,813
New England.....	141,964	150,583	280,859	289,305
Wisconsin.....	135,507	24,783	264,432	76,686
Total.....	395,995	286,014	743,486	593,834

The crop of 1885, as compared with that estimated for 1886, shows an increase of 14 per

cent. in New Jersey and 3 per cent. in New England, but a decrease of 71 per cent. in Wisconsin.

Cranberry picking on the lower part of Cape Cod will begin in a few days. Very few new bogs have been put in the past year, owing to the discouraging effect of poor sales last season. The crop is fully up to the average, and the fruit is well colored.

Reports to the New England Homestead from the principal onion-growing sections of the country indicate a short crop and higher prices. This is true not only in New England, but in the onion fields of New York State and the West. The prices to farmers are 60 cents to $1 per bushel, but the demand is moderately active and growers are disposed to hold for higher prices. The crop in Michigan, Iowa, Wisconsin and throughout the West generally is very short, and, instead of Western competition, the probabilities are that Eastern onions will be shipped West before Spring. The onion seed crop is good.

Reports from several counties in the cotton belt of Texas tell of the disastrous result to open cotton of the late heavy continuous rains; also of considerable damage resulting from the cotton worm, which is ravaging Washington and neighboring counties. It is believed that large quantities of cotton have been whipped out and damaged by rains.

Hog packing operations in the West during the week have been large, but did not reach the proportions of the preceding week; the total number packed at all points was 140,000 against 175,000 the preceding week, and 105,000 for the corresponding week last year, making the aggregate for the season since March 1, 4,760,000 which compares with 4,035,000 during the corresponding time last year, showing an increase of 725,000, and bringing the total since November 1, up to 565,000 in excess of last year.

The French requirements of foreign wheat are now put at 70,000,000 bushels, as there is a further shrinkage of five to 10 per cent. in home-grown wheat owing to poor quality for milling. The present depression in prices is attributed there to heavy arrivals and the large delivery by needy farmers.

A cablegram to De Long Mayer & Co., of this city, Wednesday, says American apples had advanced 24 cents a barrel all around at Liverpool. At Glasgow, Greenings brought from $2.04 to $3.12, and Baldwins $2.40 to $2.88 per barrel.

The wool market continues very strong, as manufacturers are buying with more freedom. The quarterly reports of visible grain and flour stocks show heavy increases since July, and indicate that both wheat and corn have been rapidly marketed. The September cotton report announces a moderate improvement in condition, owing to favoring weather.

MARKETS BY TELEGRAPH.

SATURDAY, October. 25, 1886

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is ½c. lower; No. 2 Spring, ½c. lower. Corn, ¼c. lower. Oats, steady. Rye, unchanged. Barley, 1¼c. lower. Flaxseed, 4¼c. lower. Pork, 45c. lower. Cattle, from 5c. to 25c. lower. Hogs, about 40c. lower all round. Sheep, Natives and Western, 20c. to 25c. higher; Texans, steady; lambs, about the same.

WHEAT.—Active; Sales ranged; Sept., 72⅝@71½c; October, 72⅝@73½c; November, 74⅝@75½c; May, 83⅜c; No. 2 Spring, 73½c. CORN—Firm, Cash, 36½c, September, 36⅝@36½c; October, 36⅝@36½c; November, 37⅜@38½c; May, 43¾@44⅛c. OATS.—Dull; Sales ranged: No. 2 Cash, 25⅜@25½c; October, 24⅞@25½c; November, 26⅛@26⅜c; May, 31¼@31⅜c. RYE.—Quiet; No. 2, 48½c. BARLEY, Quiet; No. 2, 56½c. FLAXSEED.—No. 1, $1 01@1 01¼. MESS PORK.—Steady; Sales ranged: Cash, $9 25@9 32½; September, $9 23@9 45; October, $9 30@9 50; November, $9 20@9 37½. LARD.—Sales ranged: Cash, $5 95, September, $5 05@6 10; October, $5 87½@6 00. Short Ribs.—Steady; Cash, $6 75. Boxed Meats.—Dry salted shoulders, $5@5½; Short clear sides, $7 10@7 15. CATTLE.—Shipping steers, $3 65@5; stockers and feeders, $2 00@3 65; cows, bulls and mixed $1 45@3 25; bulk, $2 25@3 60; through Texas cattle, strong; cows, $2@2 50; steers, $2 60@3 30; Western rangers, steady; natives and half breeds, $2 75@4 05; cows, $2 40@2 90; Wintered Texans, $3@3 45. HOGS.—Rough and mixed, $3 65@4 35; packing and shipping, $4 10@4 65, light weights, $3 90@4 45; skips $2 60@3 25. SHEEP.—Market steady; Natives, $2 25@4 25 Western, $3 10@3 60, Texans, $2 10@3 10; Lambs, $4 00@4 10.

ST. LOUIS.—Compared with cash prices last week, No. 2 Red is steady. Corn, No. 2 mixed, 1¼c. lower. Oats, 1½c. higher. Rye, ½c. higher. Butter, 1c. higher. Flaxseed, 5c. lower. Pork, 25c. lower. Cattle, somewhat lower. Hogs, from 5c. to 15c. lower. Sheep, steady for ordinary sorts; 65c. lower for best, as the quality of those in the market are not so good.

WHEAT.—No. 2 Red, Cash, 73½@74⅛c; October, 75½@74½c; November, 75½@69½c; May, 76½@77½c. CORN.—Fairly active; No. 2 mixed, Cash, 33½@34½c; October, 35¾c; November, 35½@35⅝c, May, 40⅜@40⅝c. OATS.—Firm; No. 2 mixed, 26½c; October, 26¼c; November, 27⅜c.; May, 30⅞c. RYE.—Steady at 48c. BARLEY.—Steady; at 64@66c, according to quality. HAY.—Active and firm; prairie, $8@10 50; Timothy, $11@13 50. BUTTER.—Firm; Creamery, 22@25c; dairy, 19@21c. EGGS, steady at 12½c. FLAXSEED, weak at $1 00. WOOL:—Quiet, but firm; medium clothing at 22@24½c; combing, 24@26½c; low and coarse, 15@21c; fine light, 20@25c; heavy, 15@21c; black, 15@23c. PORK, $10. LARD, $5 90c. BULKMEATS.—Nearly steady; boxed lots, long clear and short ribs, $6 87½; short clear, $6 12½ Bacon firm; long clear, 7.00@7.3c. short ribs, 7.37½@7.40c; short clear, 7 60@7.75c. Hams steady at 12@13½c. CATTLE.—Market steady; Good to Choice Native Shipping Steers, $4 20@4 85; Common to Fair, $3 50@4 00; Texas grades, $1 75@3 80. HOGS.—Market weak; butchers and choice heavy, $4 30@4 85; Packing, at $4 20@4 50; Lights, $4 10@4 15. PIGS, $3 60@4 00. SHEEP.—Market steady at $2 00@3 85.

BOSTON. BUTTER.—Receipts for the week, 17,911 tubs, 708 boxes; last week, 18,106 tubs, 749 boxes. Exports this week, 7,613 ℔; last week, 2,338 ℔. Northern creamery, extra, 26@27c; do. firsts, 24@25c; Western creamery, extra, 25@26c; do. firsts, 24@24c. do. choice, 19@21, dairy, Franklin County, finest, 22@23c; good to choice, 19@20c.; Vermont extra, 17@18c; Northern, choice, 16@17c; do. fair to good, 14@15c., Western dairy, good to choice, 12@13c; Imitation creamery, extra, 14@15c; ladle-packed, choice 14@15c do. fair to good, 11@14c. BEANS.—Receipts for the week, 1,275 bbls; last week, 1,477 bbls. Choice pea, Northern hand picked $1 75@1 85 per bushel; do. do. New York, choice, hand picked, $1 60@1 65, do. do. screened, $1 50@1 55, medium choice, hand-picked, $1 50@1 55; do choice screened, $1 45@1 50; Yellow Eyes, choice, $1 50@1 50; do. flat, $1 45@1 50; Red Kidneys, $1 75. CHEESE.—New York extra, 10@11c; do. good to choice, 8½@11c; do. common, 6@8c; Vermont extra, 9@11c; good to choice, 8@9c; common, 6@8c; Western extra, 10½@11c. do. fine, 10@10c; common, 4@6c. Sage, extra, 11½c; EGGS.—Receipts for the week, 8 boxes, 15 bbls, 6,931 cases; last week, 15 boxes, 32 bbls, 7,660 cases. There has been an upward tendency, with a good demand for all kinds of choice lots of eggs. Eastern extras are very scarce and in demand at full prices. Near-by and cape, 22c. per doz. Eastern extras, 21c; Aroostook County, 19@20c; New York and Vermont, 20@21c; Western, 15@17c; Provincial, 19@20c. FEED. 40 ℔, quoted at 65@67½c; 60 ℔, at 69@62½c; 30 ℔, at 70@72½c, 100 ℔ at 80@85c sharps, at 90c.@$1 00, Rye Feed at 75@77½c, screenings at 45@50c.

GRAIN.—WHEAT. No. Chicago at 83½c; No. 2 Spring 79c; Ungraded Milwaukee, 80½c; Ungraded Red, 76@86c, No. 3 Red, 82½@82½c; No. 2 Red, 81@84½c; No. 1 Red, 89½c; No. 2 Red, for September, 83½c; do, October, 84@85½c; do. for November, 85½@86c; do. for December, 87⅛@88½c; do. for January, 89½@90¾c; do. for May, 94⅝@95½c; do. for June, 95⅝@96¾c. CORN.—Ungraded 99c; Mixed, 45½@46c; No. 3, 44½c; No. 2, 46½c; No. 2 for October, 46¾@46¼c; do. for November, 48@48½c.; do. for December, 48⅞@49⅝c; do for May, 51⅜c. OATS.—No. 3, 31c; do. White, 33c; No. 2, 31½@31½c, do. White, 35½c; Western Mixed, 31½@33c, do. White, 35@41½c; White State, 36½@37½c. No. 2 for October, 31½@31½c; do. for November, 32½@32½c; do, for December, 33½@33½c; do, May, 36½c.

PROVISIONS.—PORK.—Mess, quoted at $10 25@10 50 for Old and $11 00@11 25 for New; $14 for Family Mess; $14 50@15 50 for Clear Back, and $15 50 for Extra Prime. BEEF.—Extra India Mess $11 50@13; Extra Mess, in barrels, $7 50@8, Packet, $8; Plate, $7 25@8. CUT MEATS.—Pickled Bellies, 12 ℔ average, 5½c; Pickled Shoulders, 6½c; Green Hams, 15 ℔ average, 8c; City Pickled Shoulders, 6@6½c; Smoked Shoulders, 7½c, Pickled Hams, 10½@10½c. SMOKED HAMS, 13½@13½c. MIDDLES.—Long Clear in New York, 7½c; at West, Long Clear, 6½c; Short Clear, 7c. DRESSED HOGS. City Heavy to Light at 6¾@6¾c; Pigs, 6¾c. LARD.—October, 6.27@6.35c; November, 6.22@6.28c, December, 6.37@6.30c; January, at 6.31@6.39c; February 6.42c; March, 6.48c; City Steam, 6.40; Refined, 6.95; Continent, 7.50.

BUTTER.—Creamery—State Dairy, pail, choice, 26c; half-firkin tubs, about prime, 24@25c; half-firkins, tubs, good, 21@22c; half-firkins common, 17@18c; Welsh tubs, best, 22@23c; do, do. prime, 20@21c, Dairy firkins, best, 23c; do. do. prime, 22@23. Western Imitation Creamery, best, 17@18c; Imitation creamery, fair and good, 14@15. Dairy, fine, 15@16c; do common, 12@14c; Iowa firkins, finest, 12@18; Iowa tubs, June, best, 12@13c; Factory, poor, 8@@10c.

CHEESE.—State factory, fancy, September, 11¾@12c; do. do. best, colored August, 11½c; do, do, white, August, 11½c, do, do, good and fine, 10¾@11c; do, do, fair, 9½@10c do, do, common, 9@9½c; Ohio factory, fine, flat, 10@10½c; State factory, light skims 7@9c.

EGGS.—State, 21½@22c Ohio and other choice lots 20½@21c; Western best, 20½@21c; do, held lots, 19½@20c; Canadian, 20@20½c; do. fair held lots, 19@19½c.

POULTRY.—LIVE.—Chickens, per ℔, at 10@12c; fowls, near-by lots, per ℔, at 12c.; fowls, Western lots, per ℔, at 11@11½c fowls Southern lots, per ℔, at 10½@11c; turkeys, per ℔ at 10@12c, ducks, western per pair at 50@75c; geese, western, per pair, at $1.25@1.50.

POULTRY.—DRESSED.—Turkeys, per pound, at 11@11c.; Spring chickens, Philadelphia, per pound at 15c—c.; do. western, per ℔, at 12@13c; fowls, Pennsylvania, prime, per ℔, 13@14c; do western, per ℔, at 12@13c.

FRUITS.—FRESH.—Quotations: Pears.—Bartlett, per keg, at $2@2 75; do, up-river per bbl, at $6@6 50; Seckel per bbl, at $3@4 75; Sheldon, per bbl, at $3 25@3 75. Apples. Gravenstein per bbl, at $2 00@2 50, Malden Blush, per bbl., at $2 25@2 50; common varieties at $1@1 75 per bbl. Peaches.—Jerseys, best, at $1 25@1 50 per basket; do. good at 75c@$1, do. plain at 40@60c. per basket. Grapes, 5@7c. for up river Delaware, per ℔. Plums.—6@8c. per quart for Quackenboss, $2 50@3 00 for Lombard; $2@3 50 per bbl, for green gage; $2 50@3 00 per bbl, for Damson. Watermelons at $15@25 per 100. Muskmelons at $2@2 50 for best per bbl.

FRUITS.—DRIED.—The quotations are as follows; Apples—Fancy evaporated, 8½@9c; do. choice, at 8@8½; do. Tennessee quarters at 1½@2c; do. State sliced at 2½@2½c, southern sliced prime at 2@3c. Peaches—North Carolina, peeled choice new, 11½c. fancy, 12½@13c; do, Georgia, choice, at 11c; do, do, prime, fancy, new, 10@10½c, do, Delaware, evaporated, peeled, 25@26c. do, do, do, unpeeled new, 12½@13½c, do, Georgia new, 10½@11c. Cherries, dried, at 10@10½c. Evaporated raspberries, 14½@15c; sun-dried do. 13c. Blackberries—Prime at 8@8½c.

PEANUTS.—Quotations are: 5½c. for best hand-picked; 4@4½c. for farmers' grades.

HAY AND STRAW.—The general tone is a steady one, though trading is rather light. Hay, Choice Timothy, 80@85c; No. 1 do, 70@75c; No. 2 do, 60@67; Clover Mixed, 50@55c; Clover, 40@45c; shipping at 50c; prairie, 40@45c, salt meadow, 40@45c. Straw.—Long rye, 55@60c; short rye at 35@45c; oat, at 35@40c; wheat 35@35.

COTTON.—The quotations, according to the American classification, are as follows:

	Uplands.	New Orleans and Gulf.	Texas.
Ordinary	6⅜	6 1-16	6 1-16
Strict Ordinary	7 5-16	7⅛	7⅛

HOLSTEIN-FRIESIAN CATTLE SALE POSTPONED.
PLACE OF SALE CHANGED.
Owing to the excitement about pleuro-pneumonia at Chicago, the Auction Sale of Mr. F. G. BABCOCK'S Herd of HOLSTEIN-FRIESIAN CATTLE has been abandoned at that point. The cattle will not be sent to Chicago, but are being forwarded from Kansas directly to New York, where they will be sold,
WEDNESDAY and THURSDAY, Oct. 20 and 21, 1886,
commencing each day at TEN o'clock, at the
American Horse Exchange
LIMITED,
BROADWAY and 50th Street, New York.
Persons who have received Catalogues and Lithographs of this Herd will please mark thereon the change of place and dates of sale above-mentioned, in order to avoid confusion.
Money Furnished to buy these Cattle.
While the terms of sale will be cash, the BANK OF HORNELLSVILLE, Hornellsville, N. Y., of which Mr. F. G. Babcock is President, will have a representative at the sale from whom responsible buyers desiring loans at two to six months, to apply towards their purchases, can secure the same at 6 per cent. per annum on their notes payable at Bank.
For Catalogues, etc., address
PETER C. KELLOGG & CO.,
107 John Street, New York.

Hornellsville, Steuben Co., N. Y.

BUHACH
THE GREAT CALIFORNIA

INSECT POWDER.

A pure California production, an infallible exterminator of Roaches, Bed-bugs, Waterbugs, Flies, Fleas, Mosquitoes, Ants, Moths, and in fact all insect pests of the household, field, orchard, garden, and conservatory.
BUHACH is guaranteed to be as harmless to animal and plant life as it is destructive to that of the insects.
BUHACH is the powdered blossoms of a California grown flower and absolutely contains no acids or poisonous drugs of any description.
BUHACH is not to be classed with the thousands of worthless and dangerous preparations so called "Insect Exterminators."
BUHACH is the insecticide of progress.
Pure! Powerful! Potent!
BUHACH is not sold in bulk, but in sealed tins with yellow labels, upon which appears our Trade Mark BUHACH as above. Beware of base imitations. Ask your druggist or grocer for it and see that you get it. Descriptive circulars mailed free upon application to us. BUHACH PRODUCING & M'F'G CO.
of STOCKTON, CALIFORNIA,
49 Cedar St., New York.

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]
Is the only Practical Preventive of the so-called Swine Plague.
If used in proper quantities, it will
1. *Prevent Disease;*
2. *Arrest Disease;*
3. *Pay for itself with the increased pork it will put upon the hogs.*

AS AN EVIDENCE OF FAITH
in my Remedy, I make the following offer:
I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my Remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and neither inbred, close-bred, or the progeny of such.

WHAT IS SAID OF THE REMEDY.
"It has stopped the hogs dying and improved their appetite."—F. C. GOLDSBOROUGH, Easton, Md.
"Have used the remedy with success."—D. G. BARBER, Easton, Md.
This medicine has been thoroughly tested and its merits established on the eastern shore."—Record and Gazette, Pocomoke, Md.
"I will not be without Haas's Hog Remedy if it costs three times the present price."—JOHN CASTIS, Grant City, Mo.
"We would not risk feeding a pen of hogs without the remedy."—WHITE & CO., Gibsonton, Pa.
"I would not think of raising hogs without it."—J. M. ELLSWORTH, Martinsville, Wis.
"It gives satisfaction every time."—J. G. BARTLETT & SON, Suncook, N. H.
"It has never failed to arrest the disease yet."—JONES & MUSSELMAN, St Paris, O.
"I have sold over $2,000 worth, and am pleased to say that it has given good satisfaction."—MELLE WILLIAMS, Druggist, Taylorville, Ill.
The Remedy can be procured of all druggists, or from my Laboratory, upon receipt of price.
Prices, **$2.50, $1.25,** and **50 cents** per package. 25 pound cans, **$12.50.**

Will quickly cure any case of Hernia or Rupture. Explanation and testimonials free. Address
O. FRINK, 163 BROADWAY, NEW YORK.

FAIR REPORTS.

(*Continued from page 678.*)

NEW YORK STATE FAIR.

FORTY-SIXTH ANNUAL EXHIBITION.

(RURAL SPECIAL REPORT.)

Large entries; bad weather; large live stock display; splendid horse show; Short-horns and other breeds for the dairy; "honors easy" on Holstein-Friesians; good words for other breeds; grand exhibit of sheep; Merinos; South-Downs; Shropshires; Hampshires; Cheviots; a poor swine show, but a splendid poultry display.

THIS session of the State Fair opened at Utica on Thursday, September 23, with larger entries and worse weather than for many years. There were 3,025 entries catalogued, but these did not include the 1,200 entries of fruits and flowers.

Of cattle there were 695 entries, of which 84 were Short-horns, 94 Devons, 132 Ayrshires, 100 Holstein-Friesians, 143 Channel Islanders, 15 Brown Swiss and 12 Norfolk and Suffolk Red Polls. The entries of horses numbered 295, of which 17 were Clydesdales, 40 Percherons, 40 carriage and coach horses, and 100 roadsters. Sheep filled their entire section and overflowed into the hog pens, there being 512 entries, comprising 23 Leicesters, 44 Cotswolds, 24 Lincolns, 39 South-Downs, 91 Shropshires, 11 Hampshires, 8 Oxfordshires, 31 Cheviots and 240 Merinos. What the sheep over-ran the hogs fell short in numbers, as there were only 171 entries, 34 of which were Large Whites, 39 Small Whites, 28 Poland-Chinas, 19 Duroc-Jerseys, 28 Berkshires and 12 Essex. Five hundred and ninety-eight chickens cackled, 22 turkeys gobbled, 25 geese squalled, and 59 ducks quacked, making a perfect babel, while 111 pigeons, 25 rabbits and 17 dogs and puppies, by their oddity and antics kept a constant crowd of admiring youngsters about them.

So full was the horse department that every stall was occupied. Stone Hall was converted into stabling, and accommodations for many others had to be built outside. Smith, Powell & Lamb showed a full half of the Clydesdales, while M. W. Dunham was the importer or breeder of a very large proportion of the Percherons. These two classes are monsters in size, ranging from a fully half ton to eighteen or more hundreds, and while they are valuable for heavy city uses and for crossing upon the lighter and more active mares of the country, the pure-breds are too heavy to be popular with American farmers for ordinary farm uses. There were also some very fine horses in all the other classes, even down to the diminutive Shetland pony, only fit for a play-thing for the little ones.

Several ideas suggest themselves as one studies closely the cattle on exhibition. While the Jerseys led all others in numbers, yet without any booming or fuss the Ayrshires crowded them closely, being only 10 behind. While Holstein-Friesians were third in number, the Devons and Short-horns are both coming rapidly again into prominence, and the time may not be far distant when a milking strain of Short-horns may lead all others. As I have talked with prominent dairymen here from diverse parts of the State, I have been impressed with the good words unanimously spoken in praise of the Short-horn and its grades for dairy use.

Among the Holstein-Friesians the herds of Smith, Powell & Lamb of Syracuse, and of F. C. Stevens of Attica, are most prominent, and the great bulk of the premiums go to one or other of them. In the one is Netherland Prince and in the other Constantyn as leading bulls, both of which have been illustrated in the RURAL. In three-year-olds the former firm won first on their bull "Prince of Artis;" in the two-year-olds the latter got the blue ribbon on "Henry of Maplewood." Clothilde is shown in a separate tent as the largest milking cow in the world, having given 26,021 13-16 pounds of milk in a single year. By her side stands Albino, with a record of 18,484 13-16 pounds as a two-year-old.

In Jerseys there was a sharp competition and the premiums were considerably scattered, though T. R. Proctor got the lion's share. The Devons and Short-horns had many admirers in the crowd, and well they might, for no more beautiful animals exist than the red and comely Devons, and the Short-horns fill the eye of every lover of a good roast.

The Norfolk and Suffolk Red Polled bull, "Rupert," four years old, took first premium, and pleased all who saw him. In fact, he was a fine specimen of a Short-horn bull minus the horns. I can see no reason why, as these animals become better known, they should not become popular, for they have many of the best points of the Short-horn, and must prove profitable feeding animals.

Of course, the American shepherd's ideal sheep is the Merino, and though we now have no boom on this breed, yet half the sheep on exhibition are of this class. Among the exhibitors were Davis Cossit and John P. Ray, both away up as breeders, and both have some very superior sheep and heavy shearers, and claim that abundance of wrinkles and grease is inseparable from fineness of staple and heavy weight of fleece. There were on exhibition three rams from W. G. Markham's importation of French Merinos bred by Baron Foon Homeyer, of Pomerania—one, three years old; and two, two years old. They are very large, exceedingly strong in the legs and with very compact fleeces of short-staple, fine wool, very free from grease and yolk. It is worth the while of our breeders to experiment in using this as foundation stock in the breeding up of a mutton-and-wool-producing breed. The long-wools were represented by Cotswolds, Leicesters and Lincolns; but none of these breeds has ever become popular, and I doubt if they ever will, as they are not adapted to our methods of keeping in large flocks. Among the South-Downs were the imported rams No 10 and No 10 Royal Shrewsbury, by J. H. Warren. The former was imported in 1885 at a cost of $814—the largest price ever paid for any sheep brought to this country. To my mind, the latter, which was imported this year, is by far the better animal, being fuller in the shoulder and ham, and in every way the better model.

The Shropshires shown were very good and were in favor with very many. I notice, though, that they are more uneven than the South-Downs. This may be because different bloods have been mingled in their make-up, and because proper care has not in all cases been used in the selection of breeding animals. There is a future for this breed, and the wise breeder will be very careful from what animals he breeds, and how they are coupled. There were only a few Hampshires shown; but some of them would compare favorably with any to be found. These sheep with their large bodies, strong constitutions and very black legs and faces, should be very valuable for crossing upon native ewes for breeding early lambs. There were some very good representatives of the Cheviot sheep from the hills of that name in the south of Scotland. They are handsome sheep of the middle-wool class and with their beautiful white faces and long, slim ears, captured the hearts of all Scotchmen present.

The swine exhibit was much below what could be expected in the Empire State, and what few there were were about equally divided between the Large Whites, Small Whites, Berkshires and Poland-Chinas. The little roly-poly Essex, and the representatives of the opposite extreme, the Duroc-Jerseys, were in about equal numbers, and only a dozen each. The RURAL'S contributor, Col. Curtis, showed the bulk of the Durocs, and is to be congratulated on what he is doing with them in the way of shortening their noses, and reducing the size of their legs and ears. He bids fair in a few years longer to make a very presentable pig of them.

The show in the poultry department is much the largest and finest ever seen at a State Fair. The large hall is crowded from end to end and from the ground to as high as the coops could be piled. In chickens the Plymouth Rock, if numbers tell, is the favorite, with Wyandotte second, and White Leghorn third. I saw many of the RURAL'S good friends among the exhibitors, and can only wish each one might have taken as many prizes as he wished.

(*Concluded next week.*)

NEBRASKA STATE FAIR.

(RURAL SPECIAL REPORT.)

Weather favorable; a fine horse exhibit; undue prominence of speed horses; a large cattle exhibit; honors divided between Short-horns and Herefords; fine grade Aberdeen-Angus calves; Poland-Chinas ahead among swine; small display of sheep; a large poultry show; a poor fruit show; an objectionable contrast.

THE Nebraska State Fair was held at Lincoln from Sept. 10 to 17. With the exception of some light showers and a threatening morning on "the best day," the weather has been all that could be wished. Large crowds have been in attendance and the managers have been as successful as they deserved. There cannot fail to be a nice cash surplus over expenses. The entries before the opening day were such as to give the belief that the display in nearly all departments would be better than ever before, and during the exhibition this fact was quite the common remark.

Of horses the exhibit was good, while some animals were of marked excellence. Several enterprising Western breeders were represented with some of their best stock, and the contests for first places were warm. The grand sweepstakes for the best stallion among draft breeds was easily won by the three-year-old Shire stallion Gallileo, owned by the Importing Draft Horse Co., of Lincoln. This stallion also won the sweepstakes as the best stallion in his class. The Normans were out in force, but most of the specimens were too young for substantial honors in the show ring. These horses are apparently the favorites with farmers. I have but little to say of the speed horses. I do not believe in them, or sympathize with the prominence given them. The effect of racing stock is demoralizing upon real progress; but as long as they will draw great crowds they will be in favor with the average fair manager. There is need of an educated public sentiment upon this point, and it needs thoughtful men to lead as teachers. Those at the head should aim to promote the interests of the visitors and not produce excitement. I have noticed that a large part of those who attend State fairs go for the fun and excitement; while industrious farmers stay at home, because, as they say, it will do them no good, so they cannot afford it.

Over 300 head of the different breeds of cattle were in the stalls. The Short-horns and Herefords were best represented, and each was about equal in numbers. The Short-horns carried away the grand sweepstake prize for best bull of any breed, and the Herefords for best lot of five animals. Popular opinion was in favor of the Herefords in that they were much superior in average excellence. Some of the Short-horns were very fine, while others were coarse and rough. The Jerseys were well represented, but were in favor only with those wanting family cows. The Holsteins were here in numbers, but could not attract attention from the beef breeds. A few Devons were on the grounds, and the herd of seven head shown by R. H. Payne, of Ohio, took all the best first premiums, and were interesting in showing what this breed can do. A part of the cattle exhibit deserving more than mere mention was the four grade Aberdeen-Angus calves belonging to Mr. A. W. Nelson. The grades were by their mothers, which were common natives, and were a decided improvement. Mr. Nelson has 34 grade calves from his Aberdeen-Angus bull, and all are polled, although some of the mothers have the largest of horns. In form, too, the calves bred closely after the Aberdeen-Angus type. A good lesson as to what could be done with our scrub stock could be learnt from this exhibit.

About an average number of hogs were in the pens, and there were about the usual number of each breed with possibly the exception of the Berkshires. The Poland-Chinas were strongest in numbers and, also, in popular favor. The only objection I heard to them was that they were a little too sluggish in running after feeding stock.

But few sheep were on the ground, and it is surprising that, with the broad Western ranges to support them, there are not more of these useful animals.

The usual display of all kinds of farm machinery and vehicles was to be seen. The Baker Barb Wire Co., one of the firms that pay a royalty to the Washburn, Moon Co., made its style of wire on the grounds, and always drew a crowd. A new thatching device also attracted attention.

The poultry exhibit included 146 entries, and the competition has, I think, done much good. It is to be hoped the society will provide more convenient quarters another year, and recognize this industry in a way fitted to its magnitude.

The display of agricultural products was fine and well arranged. Exhibits of their special products were made by several counties, Dundy County showing "sod crops;" all kinds of vegetables and many grasses and grains were displayed and tastefully arranged. This county is in the far western part of the State and in the center of what but a little time ago was called the "desert." Now its settlers are sanguine of its becoming the richest of farm lands.

For a State which has taken national honors, the horticultural exhibit was poor. Many exhibitors were slack in arranging their work. Apples are small this year, and the display was not as fair as usual.

Art Hall presented the usual entries of musical art, fancy work and pictures. I think a sad mistake was made by the managers in admitting grocerymen and others in this building. A beautiful picture would meet the eyes on one hand, and a display of canned goods on the other. On one side of the aisle were musical instruments and music; on the other free chews of tobacco attracted a larger crowd.

But, all in all, the fair was a very good object-lesson to all who came. L. E. B.

PERSONALS

AT Queen Victoria's table there are three servants to every six guests. When the meal is finished Her Majesty is the first to leave the room.

THE widow of Dr. Octave Pavy, late acting assistant surgeon United States Army, under contract with the Greely expedition, who died of starvation at Cape Sabine about June 6, 1884, will receive a pension of $17 per month.

PASTEUR says that out of 1,200 natives treated by him for the bites of rabid animals only three died, and of 600 foreigners who came from long distances, only 15 died. How many were bitten by really mad animals, and how many of them were hydrophobia-proof anyhow?

EMPEROR WILLIAM is accompanied in all his travels by three court physicians. He may die at any moment at his great age. He is now the great peace-preserver of Europe. On his death, war is nearly certain, as the political relations of nearly all European nations will change.

THE mother of the present Czar bequeathed 2,000,000 roubles to Prince Alexander, late of Bulgaria, who was her favorite nephew. The legacy has never been paid, but the Prince has received the interest on it. His cousin, the Czar, has for years disliked him personally on account of a childhood quarrel. He was a great favorite with the late Czar.

CONGRESSMAN FELTON, of California, comes of a family of lawyers, his grandfather having been Chief Justice of New York. He went to California when only 19 years old, without a cent. He made a fortune in a few years by buying and selling mines. He now owns the entire oil belt of the Pacific coast, and his wealth is estimated at $10,000,000.

THE entire domain of Chantilly, with its magnificent castles and all its dependencies, the value of which at the lowest estimate is over 60,000,00 of francs—$12,000,000—has been presented by the Duc d'Aumale to the Institute of France, to be held by it in trust for the French nation. After defraying the expenses of keeping the place up, the surplus revenue is to be devoted to the promotion and reward of art and literature.

THE Chevalier John Sartain, of Philadelphia, long distinguished as an engraver, is almost 80 and very vigorous. He introduced mezzotint into America, established a magazine, fed and clothed Edgar A. Poe, received decorations fro half a dozen European potentates, managed the art department of the Centennial Exhibition, still occupies the house to which he brought his bride from England 60 years ago, and next Spring will proceed to London to take charge of the art department of the forthcoming American Exhibition.

HOLSTEIN-FREISIAN CATTLE AT AUCTION.

I shall sell without reserve over 90 head of males and females of all ages from the MAPLE PARK STOCK FARM. Sale to commence Oct. 6, 1886, at the Union Fair Grounds, Geneva, N. Y. This will be a grand opportunity for those wishing to start a herd of registered cattle, as I am over-stocked and shall offer the very best animals in my herd. I selected personally from the best herds in Holland, a large share of these cattle, regardless of expense. "Gen. Grant" and "Ho-Ho" my noted bulls will well repay a journey to the sale. Catalogues ready.

JAMES BLACK, Stanley, N. Y.

OXFORD DOWNS.

Another importation will arrive Sept. 1st from the celebrated flock of John Treadwell, whose sheep have again this year won 1st, 2d and 1 Champion prizes at the "Oxfordshire," "Bath and West of England," and the great "Royal" shows. His best Rams are by my grand imported, 420 lb., "Bicester," winner at these Shows '83, '84 and was 1st at sweepstakes, *over the other Downs*, at Chicago, Madison, Wis., and St. Louis. Mr. Treadwell wanted him back last year. For sale, Imported Rams, Ewes and Lambs by Imported "Bicester," "Sir John," "Baron Campsfield" and "Donatus."

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XLV. No. 1916. NEW YORK, OCTOBER 16, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

Architecture.

A NEAT COTTAGE.

THE design shown at Fig. 386 '87 '88 is for a cottage now being built at Lewaren, N. J., and is one of a number that have been erected during the past year. The plan is so arranged that a view of Staten Island Sound, which is just at the rear of the grounds, can be had from all the principal rooms.

Convenience of arrangement is what has been aimed at, and a glance at the accompanying plans will show that this point has been gained. The hall is quite large, giving a good impression to a visitor when first entering the house. It is amply lighted from the rear, both by windows above and below the platform of stairs, and from its size—13 by 16 feet—a delightful sitting-room can be had. All the other rooms on the first floor are reached by doors from the hall, thus obviating the

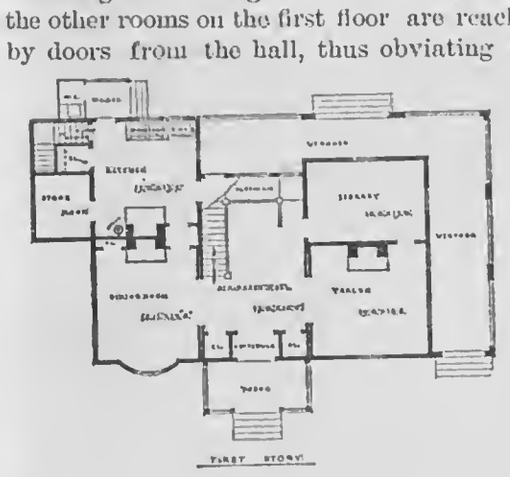

Fig. 387.

necessity of passing through one room before entering another, and yet the rooms on each side of the hall are connected. The kitchen is large; the wash trays and sink are placed in one corner so as to give a space in the middle of the floor for a table; the store-room connected with the kitchen is fitted up with shelving and a pastry table.

The parlor and dining-room each have an open fire-place, so that a "fire on the hearth" can be had in these rooms in early Fall, before it is time to start the furnace. The rooms on the second floor are all large, light and airy,

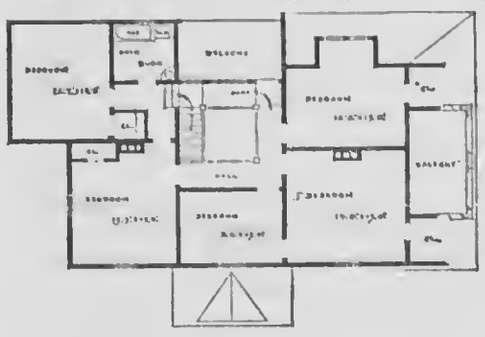

Fig. 388.

and each has a large closet. The bath-room is placed conveniently to all bed-rooms, and yet is at the extreme outside of the house, thus doing away with any fear of sewer gas in the bed-rooms. All rooms are to be heated from the furnace.

While convenience of arrangement has been sought after in the interior, the outside of the house has not been overlooked, and a view of the perspective, herewith given, will show a very pleasing exterior. The cost of the house is as follows:

Carpenter's, mason's and painter's work	$3,500,00
Plumbing	250,00
Furnace and range	240,00
Total	$4,000,00

Further information can be had by addressing the architect, Clarence W. Smith, 30 Broad St., N. Y., who favors us with the sketches.

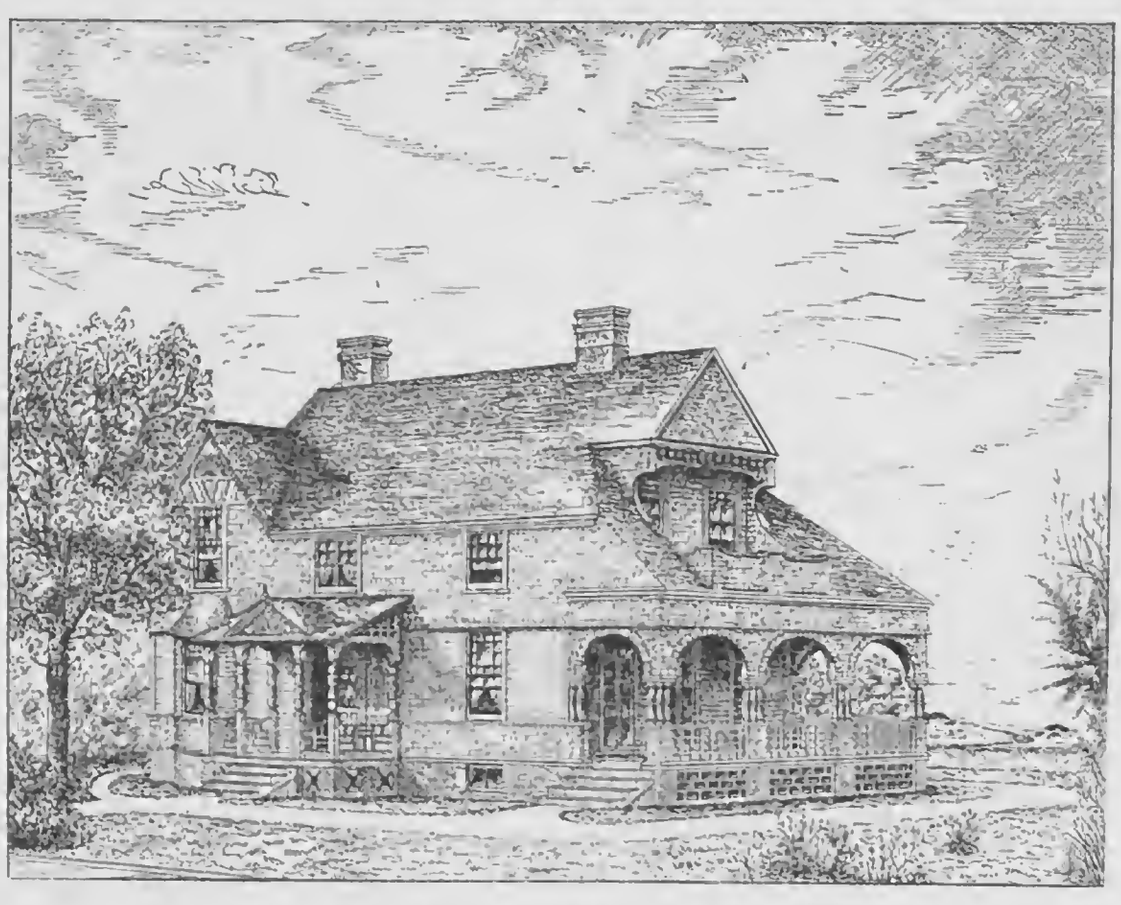
Field Crops.

SOMETHING ABOUT THE LEAVES OF GRASS.

DR. W. J. BEAL.

To a casual observer, the leaves of grass may seem to be all alike, except that some are larger or wider than others. Even Linnæus thought this was the case; but recent researches reveal a structure which is marvelously made. In details, the leaves vary much, while nothing seems to be better constructed for the purpose of sustaining the plant and at the same time yielding bountiful supplies of food to the beasts of the field.

As a boy, before I had ever studied botany, I remember more than once to have longed to know all there was to be learned about a blade of grass. It was a small affair, but there must be many mysteries locked up in those green cells. Time and study have shown that there were more things than I had



A NEAT COTTAGE. Fig. 386.

dreamed of, and yet it seems as though there was enough left unlearned to keep any one busy for a life-time. The sheaths of the leaves are described as split on the side opposite the blade. A few exceptions are given; yet a study of the young branches shows that many leaves have closed sheaths. Even five or more of the lower leaves of June Grass and Orchard Grass have the sheaths closed, while those above are split open. Many leaves are very slender, with a rib in the middle, but those of Rice Cut-Grass and Wild Rice have the main rib on one side of the middle.

In June Grass, we find a narrow blade with the two margins parallel, while in Indian corn the blade tapers very gradually to a point. In the leaf of the latter the veins on the margins disappear one after another, only a few of the middle ones extending to the apex.

The careful examination of a leaf shows it to contain *fibro-vascular bundles* or veins which run lengthwise and nearly parallel. Over the leaf on both sides is an epidermis which varies much in thickness in the same grass, depending on the amount of light and moisture. There are rows of small openings or mouths on the leaf, sometimes above, sometimes below. These admit air to the interior of the leaf where the granules of chlorophyl, through the aid of light, assimilate or digest the raw materials and fit them to nourish and enlarge the plant. The green leaves are chemical laboratories or factories busy throughout the growing season.

A leaf of grass elongates by a rapid multiplication and enlargement of the cells just at the base of the blade. Cattle may eat off the tip many times, and yet it keeps elongating. A leaf of June Grass or Orchard Grass may make a growth of two to five or more feet in a single season, yet all the time remain short, as the ends are frequently cropped by the cattle and sheep. The leaf has an upper side and a lower side, yet, strange as it may seem, about half of the leaves of grasses are regularly "wrong side up" Why this is so or of what advantage it is to the plant I am unable to tell you. Many leaves show tortion in one direction or the other, often quite uniform in the plants of one kind. The cause is obscure, if known at all.

Many leaves of grasses are more or less covered with small hairs which usually point towards the apex of the blade. In a few cases they are stiff and curve backwards or downwards, and help to hold up the stems by hanging on to other plants or on to each other. These hairs apparently help to protect the leaves in dry or very hot sunny weather. In moist, shady places grasses usually have but few hairs. A thick epidermis also protects plants in dry places. Cool, moist countries are proverbial for their succulent and nutritious grass.

THE SWEET POTATO IN THE SOUTH.

THE sweet potato is to the South about what the common potato is to Ireland or Germany. It forms a very large part of the food of the negroes and poorer whites, in fact, it frequently takes the place of bread to a great extent. The favorite way of cooking it here is to bake it in the oven or in the ashes. The children are fond of burying the potatoes in the ashes at night, so that they may slowly cook all night. The southern-grown sweet potatoes are larger and sweeter than those grown at the North. Those raised in Mexico are very sweet indeed. It is not a good thing for the South, in all respects, that sweet potatoes are so easy to raise. An average analysis gives them 75.8 parts water, 1.5 part protein, fats 0.4, carbohydrates 20, woody fiber 1.1, and mineral matter 1.2. They are weaker in protein and carbohydrates than the common potato, and thus inferior as an article of diet. Such potatoes with corn bread and pork, never will make brains like oat-meal, baked beans and fish. It would be a good thing for the South if the use of the common potato could become more general. Farm Topics.

CORRESPONDENTS' VIEWS.

PRIVY VAULTS ON FARMS.—The vaults on most farms are disgraceful affairs. They are direct sources of disease in Summer, and hardly more friendly to health in Winter. The snow drifts into them and the wind blows through them. To compel women and children to resort to such places is downright cruelty. It seems strange that farmers who desire to improve their homes reach the closet last of all. They will build wood-sheds and other conveniences and still retain that cold, windy closet with its death-dealing vault. In my new house the closet is just at the end of the wood house. There is no vault at all. Two large iron buckets are placed under the seats, on a shelf. These are partly filled with sand or road dust. A barrel of dust stands in a corner of the closet, a tin dipper is kept in the barrel, and a dipperful of the dust is thrown into the buckets whenever the closet is used. This rule is rigidly enforced. There is not the slightest odor from this closet. Once every two weeks the buckets are emptied and this operation is as clean as that of emptying ashes. There is no tramping out into the cold and storm. Come, farmers, wake up this Fall and put an end to these disease-breeding vaults. Clean them out for good and then fill them up. You will never regret it. H. C. K.

Steuben Co., N. Y.

SECOND BLOSSOMING, ETC.—The peculiar character of the past Spring and Summer, first wet, then dry and then wet again, has changed the usual course of vegetation, and I have cherries in full blossom, and nearly all my dwarf pears and quinces and some apples are opening and will be in full blossom in a few days. I fear this will cause the loss of next year's crop. The same thing occurred with me some years since in the south of England. After an unusual Spring and Summer my plum trees were in full blossom at Christmas, and they did not fully recover their usual habits for three or four years. I shall pick off all the blossom buds on some of the trees to test the matter; but fear the season is too far advanced to mature another set of buds. The Japan Clover is far from being "worthless" here. It covers the ground in a dense mat, and stock are fond of it. It will grow 15 inches high, and, as you say, is then somewhat hard and tough. THOMAS BRIGDEN.

Walker Co., Ala.

A GOOD START.—A year ago we succeeded in starting what is known as the Cayuga Co. Farmer's Club. We started with eight members, holding our meetings in the Grand Jury Room at the Court House. The club has now attained such size that the room is too small for our use, and we have been obliged to secure a larger hall. D. P. HARDY.

Auburn, N. Y.

"NOTHING IN IT."—In the RURAL for Sept. 4, J. S. B. told us how he kept Bartlett pears, by packing them in bran. We have tried it and find that there is nothing in the treatment. We lost quite a few Bartletts—all in-

side of two weeks, though they were carefully treated as per J. S. B.

Ontario, Canada. H. H. HURD & SONS.

THE only remedy for the cabbage worm that I have never known to fail is to set the plants out in Montana. We do not have the pest here. The valley of the Gallatin is ahead of the entire world as a farm and garden section. P. B. V.

Fridley, Montana.

PUSH AHEAD.

THE article by E. Davenport, in a late RURAL, suited me. I do not believe in waiting for better prices. Let farmers adapt themselves to circumstances and press forward. A successful farmer can be made with the same energy and push that it takes to make a man a success anywhere. I know grocerymen who complain of small profits and business overdone. They sit and smoke their pipes with their goods covered with dust, soap and starch and sugar all mixed together. When customers come in they spend the time talking about hard times instead of trying to sell goods. Another groceryman keeps his mouth shut about the hard times. He adapts himself to circumstances, makes small profits, to be sure, but sells lots of goods and makes money.

It is just the same way with farmers. One man thinks he can't afford to buy manure. He hires a man to cultivate 50 acres to produce a crop that would have grown on 10 acres with proper manuring. His tools make a loss of 25 per cent. in time. His horses are poor. He has to club them hard to get half a day's work in 16 hours. He expects a whip to take the place of oats. His cows are half wintered because hay is high. He can't afford to build fences, so his cattle break into the crops. He keeps scrub cattle. These make a scrub man out of him. With his scrub mind he can't see that fine cattle cost no more to raise, and sell for four times as much.

The other farmer knows the times are all right if he can only make his farm produce the largest crops with the smallest amount of labor. He buys the best tools, hires the best men, looks after them and sees that the work is well done. If he does not have manure enough, he buys the best standard fertilizer. He keeps the best cattle and horses, and starves himself rather than starve them. He spends his evenings at home reading an agricultural paper, and not in the store talking up hard times and village gossip. He studies about fruit culture and selects the best varieties, and plants plenty. He doesn't patronize some wandering tree peddler, but he buys of some reliable nurserymen. He has a good home, and he makes money.

Is the contrast overdrawn? Not a bit. Success means energy, courage, head work and perseverance; and failure means little but work in the wrong direction. It is time to stop growling about hard times. Wake up! Put energy and push into your farming and make every crop and every head of cattle pay you. If it does not, see that it is not your fault. Read agricultural papers and get the experience of others. Don't hold the cent so near your eyes that you can't see the dollar beyond it. Too many farmers make themselves near-sighted in this way. It is folly to fish with a bare hook because bait is scarce and high. Wake up, farmers, and see if you can't get better crops. EMMONS POND.

Greene Co., N. Y.

Indust'l Societies.

AMERICAN HORTICULTURAL SOCIETY AT CLEVELAND.

(RURAL SPECIAL REPORT CONTINUED.)

Small fruits in New England; cost of raising; fertilizers for; packing and marketing; little profit the rule; best varieties; currants, blackberries; Lucretia Dewberry; grapes, strawberries in Ohio; Newaan and Triumph for the South; the Bubach; shipping long distances; the Jewell; Jessie, Parry; ravages of the Tarnished Plant-bug.

THE closing paper of the second afternoon session was by J. H. Hale, on "Small Fruits in New England." Everybody expected a practical and instructive paper, and such it was. It was read distinctly by the enterprising editor, Myrick, Mr. Hale being kept at home by illness. "I think," said he, "that we in New England are producing and eating more fruit than the people of any other section of our country. A ten-acre field would be a big plantation with us. It costs us $150 an acre to raise strawberries. As a fertilizer we use ground bone and muriate of potash; $35 worth of bone and $15 of the potash per acre, using no stable manure. Raspberries, gooseberries and currants cost us about $75 an acre to grow. Currants are now sadly neglected; not over 100 acres are grown for market in New England. Our raspberries grow in hedgerows 3½ feet apart. Blackberries are not largely raised, yet the product of one acre last year paid the owner for 560 bushels of corn. We market strawberries in American square quart baskets, packed in good, returnable crates, having racks which allow for heaping up our baskets with fine, large fruit. These, with the new, white poplar baskets, sell for two or three cents more a quart than if packed in the small, rough crates used in the West. We sell from our own wagons to consumers and retailers, thus securing better prices, and yet none of us is getting rich. Some make a living, others lose money. We hear much of the one successful grower who raises 6,000 to 8,000 quarts of strawberries per acre, which he sells for 15 or 20 cents a quart; but the ninety and nine just men who get only a thousand quarts and sell at five to eight cents, we never hear from at all. And yet I advise those already in the fruit business to hold on; cultivate better, grow fewer acres, get better profits. To beginners I would say: "Don't begin." As to varieties, that's a 'local issue,' and the less said about it the better, unless we want to demoralize the business. Half of all the strawberries grown in the East are Crescent, the balance are Miner's, Downing, Sharpless, Windsor, etc. The leading raspberries for home and market are Cuthbert for red and Souhegan for black.

The Cherry Currant is largely grown, but Victoria is larger, ripens later, and sells for better prices. Snyder and Wachusett blackberries for market, for the home we add Kittatinny. The Jewell, Belmont and Bubach Strawberries, and the Enrhart and Carman Raspberries are promising new sorts. The Lucretia Dewberry is very early, doing well. Worden, Moore's Early, and Concord are our most profitable market grapes. Worden grows in favor each year. For family use all but the very late-ripening varieties can be and are grown to perfection by amateur growers in the cities and towns. We are making great progress in the cultivation of our tastes. To me there is no home without a fruit garden, and yet many a family never knows what a home with a fruit garden is, and for these people we should labor as a society." At the conclusion of the reading of Mr. Hale's paper, President Earle said: "One of the clearest, sharpest and most admirable papers ever presented; and by one of our clearest and sharpest of men." A long strawberry discussion then ensued, two or three members often talking at once.

Mr. Albaugh spoke most enthusiastically of the large and successful strawberry interest at Barnesville, Ohio. Said he, "I was there at their show in June last. Sharpless is the leading sort, 100 bushels of it are grown to ten of all others; the hill system of culture is used; rows planted parallel with the hill; runners cut persistently. An effort is made never to ship a bad berry from the place, also to get *just as big berries in the bottom as at the top of the basket.* They had shipped a tram-load of 1,200 bushels the day before my visit; one man had just picked 190 bushels."

Mr. Ohmer: "To gather these 1,200 bushels in one day everybody picks; the schools are adjourned in that season; even the first ladies of the place pick, and sometimes earn as high as $2 per day. Cumberland Triumph is raised second to Sharpless. From 100 to 140 bushels per acre is the average product." Dr. McKay, of Miss., conceded the palm to Barnesville. "Wilsons do not grow well of late in the South. We get more from Neuman than from any other kind; can ship them to New York or San Francisco. We now ship north and west and get better prices than in the New Orleans market. The finest of all berries we have grown in the South, however, is Cumberland Triumph. Nothing equal to it; ten days later than Wilson. I grow 40 varieties." Mr. Caywood: "What about the Bubach, which originated in Northern Illinois?" Mr. Miller: "I think well of it. Very promising, indeed. The fruit is uniform in size; it pleases me very much." Mr. Ford: "Fair grower; nothing more hardy; a little fruit this year."

President Earle, speaking of the transportation question, said: "The conditions in the East and in Miss. are very different; the market is near at hand in the first case and very distant in the second. We cannot return packages in the West and South, and must have cheap gift packages. I never found a berry so tender or so delicate that I could not ship it a long distance. Some sorts will color after being picked, others never do. There is no trouble to ship 600 or 1,000 miles, but of course it must be in refrigerator cars. Our crates and boxes in the West cost about two-thirds of a cent per quart, and are very satisfactory to us. As to variety with us, at Cobden we raise three quarts of Crescent to one of all others. Sharpless has serious faults as well as virtues in the West. The blossom is tender to frost, the berry will not ripen at the tip, and will not ripen after picking. Of course, we fertilize the Crescent with some perfect-flowering sort."

Prof. Green, Ohio: "We have a number of the newer sorts under trial at the Experiment Station. As to Jewell, there is nothing particular against it, except as to flavor. It is a promising market sort; don't know that the plant is very vigorous. Jessie seems one of the most promising new sorts we have. Plants very vigorous, berries large—productive. May King is promising, large as Crescent, a little larger, perhaps. Same season. Don't know what to say about Parry. I thought well of it last year, not quite so well this; plant lacks vigor. Bubach is perhaps the best of the newer kinds; berries grow as large as the picture."

Mr. Smith: "Regarding the Jessie, Mr. Louden's Seedling, the Wisconsin State Society visited it on the originator's grounds last season and were very enthusiastic in its praise. The berries lay upon the ground in heaps. They were fair in shape, of good color, averaging very large; one measured nine inches, quarts would measure from six to seven; flavor very fine. If it does as well after dissemination, it will be a great acquisition surely." Mr. Crawford, spoke very highly of it: "It is the only sort ever sent me that did well two years in succession; good quality, ripens all over at once." Mr. Miller: "Mr. Louden wrote me that his six acres of the Jessie, in spite of the great drought, had yielded over 200 bushels per acre." Mr. Smith: "I have no doubt of it from what I saw when I was there."

President Earle spoke earnestly of the serious ravages of the Tarnished Plant-Bug, asking for information and a remedy. "I don't know whether we are going to get any strawberries at all in the West if this insect keeps up its depredations. In Illinois we know nothing about exterminating it. When you see berries imperfect and seedy at the end, you may be sure this bug has been at work there, sucking the juice from the young, green berries. It has caused half-a-million dollars' worth of damage in one season in a few counties in Illinois." H. H.

NEW YORK STATE FAIR.

FORTY-SIXTH ANNUAL EXHIBITION.

(RURAL SPECIAL REPORT, CONTINUED.)

Seed and vegetable displays poor; Experiment Station's exhibit good; an average display of cheese boxes; a hodge podge; give the the home and ladies a chance; a fine exhibit of fruit, especially by Ellwanger & Barry; new Chinese pears; a "family competition"; fine display of grapes, especially of Niagaras; best five grapes; Marvin's seedlings; splendid Concords; good floral displays; a wet-blanketed fair; beer guzzling sanctioned.

IN the hall devoted to farm produce and dairy products the show was not worthy of this great State. In grain and seeds five barrels of beans, three of corn, nine of peas, 11 of white and two of red winter wheat, 16 of rye, 12 of white oats, three of black oats and eight of barley with six bushels of buckwheat, two of flaxseed and three of timothy seed covered the exhibit. Mr. M. F. Pierson, of Seneca Castle, showed 360 varieties of potatoes, 100 plates of which showed the product of single eyes. Of course he got first premium. He also displayed on plates 100 varieties of beans, showing nearly every sort grown.

The vegetables were in small collections, and aside from the show of the Experiment Station, not worthy of especial mention.

The New York Experiment Station made a large show, consisting in part of 70 or more varieties of oats in the straw, 75 varieties of cabbage, embracing all grades of wrinkled, curled and ribbed, and all shades of color from green to red: also a new variety of tomato of their own originating. This is very dwarf and very productive and is very promising, indeed, especially for forcing.

The collection of cheese and butter was as large and the quality fully as good as that at any fair for many years. I think a reform is needed in the way of showing cheese. A collection of ordinary boxes, of which only the outside can be seen, while no one can more than guess whether they are full or empty, is not a very attractive sight and cannot be expected to collect and hold a crowd or afford any instruction. Maj. H. E. Alvord showed a collection of fancy and foreign styles of cheese, which caught every one's attention (by the nose) and called forth much comment. They were put up in tinfoil and, though smelling as rank as "Othello's offence," are said to be very palatable and are finding a ready market.

In the halls usually devoted to domestic manufacturers and ladies' goods there was a perfect hodge-podge, among which I noticed six or eight boats, a man hawking some sort of washing compound, three or four salt exhibits and half a dozen men advertising some trinket. If the society ever made a bad mistake it was in sitting down so heavily on this part of the show as to obliterate it. The officers of the society should lose no time in heeding the universal protest, not only of the ladies in attendance, but of their friends (and this means everybody) in reviving this very popular department, or they may find that in sitting down on this they sat down on a pin. Clearly the best good of the society will be subserved by heeding the popular wish.

When we take into the account the almost total failure of fruit in the Western portion of the State, the fruit garden of New York if not of America, the show of fruit in Floral Hall is certainly to be commended. Some 240 feet of tables were filled with about 900 plates, of which 225 were of pears, 220 of grapes, 200 of apples, 50 of plums and a dozen of quinces. As usual Ellwanger & Barry made the bulk of of the display, showing 145 plates of pears, 46 of plums and 41 of grapes. Besides these, Mr. Barry, from his private grounds shows 13 plates of pears and 20 of hothouse grapes. No firm in this country are doing so much to create a taste for fine fruit and to educate the people as to correct names and perfection of samples, as their varieties are always correctly named and the samples perfect. In their collection of pears were the new Chinese pears Mikado and Damio. Both of these are very beautiful, especially the former. It is medium-sized, round, light-yellow, thickly studded with bright black dots, which makes it perfect, and it is a great pity that so handsome a fruit should be good for nothing else. They also showed the prettiest plate of Seckels I ever saw, so perfect in every way and so highly colored that one cannot blame the small boy who wished to appropriate them to his own use.

In their collection of plums I noticed fine specimens of the new Chickasaws, Newman and Columbia. The last could easily be mistaken for an over-grown cranberry, and one would hardly be decided did he taste it. In the contest for single plates of pears, Mr. Barry showed five in competition with his firm, and captured four of the five first prizes. An amusing incident occurred in judging the plates of Angouleme; they were so nearly alike that it was doubtful which would get the first prize, until one of the judges discovered the slightest bit of a worm-hole in the calyx of one specimen of the firm's exhibit, and gave the first premium to Mr. Barry—as they said in their report—by a single worm hole."

The show of grapes was very fine, particularly that made by the Niagara White Grape Company, of Lockport, they having pounds and pounds on the tables, of which they gave freely to every one. To show how popular this grape has already become and how fully the RURAL'S estimate of it has been realized, let me say that in every collection competing for the prizes, whether of 20, 10 or five varieties, the Niagara was placed at the front.

Ellwanger & Barry's choice of the five best grapes was, Ionia, Rochester, Niagara, Gaertner, and Barry. B. W. Clark, of Lockport, selected Agawam, Duchess, Niagara, Ionia, and Eumelan. Palmer Worden, of Central New York, chose as best five, Concord, Duchess, Niagara, Iona, and Brighton. H. M. Jacques, of Western New York, showed Concord, Delaware, Niagara, Wilder, and Agawam.

D. S. Marvin showed a large lot of new seedling grapes, many of which were not as yet named. Among others, I noticed Rutland, Centennial, Cayuga, and Rural New-Yorker. Rutland has a medium-sized cluster; compact, black berries, one-half inch; meaty, and of good flavor. I should judge it is quite early. Skin is thin, but tough. Centennial has a cluster and berry much the size of Prentiss; usually a little shouldered, of a pinkish-green color; skin tough, quality good; a little pulpy, but not tough; free from foxiness, and of a vinous flavor. Cayuga is a black grape; clusters long, not shouldered; berries as large as Concord, and a fine black, covered with a nice bloom. This grape in character and quality is so much like Adirondac as to be its brother. I hope in growth and foliage it may prove more reliable than that. The Rural New-Yorker is a black grape, with long, large clusters, always much shouldered, so much so as to be branched in many cases; berries about three-quarters of an inch in diameter, jet black, with a heavy bloom; in quality much like the Clinton, though perhaps not quite so sour. I should say it is quite early, and a good wine grape. Mr. Marvin is certainly deserving of much credit for the long and earnest labor he has devoted to the improvement of the grape. I certainly wish him success.

In the contest for single plates of Concords four of the best plates of that variety I have ever seen were shown. The judges were able to make the award only by the use of scales

and there was a difference of less than two ounces in the four plates, and either weighed over five pounds. When we realize that one came from the Hudson River, one from Western New York, one from Onondaga County and one from Schuyler County, it must be conceded that if our people do not grow all the Concords they can use, the fault is their own. I cannot omit to mention a plate each of Tompkins County King, and Twenty Ounce Apples, shown by Monroe Dunham, of Bennettsburg. They were as good as I ever saw, and none could be better.

In ornamental and hot-house plants the show was very creditable. The center of the tent was filled by two fine displays—one by the professional florist, Wm. Matthews, consisted of a great variety of plants, including some very fine orchids in bloom. The other was from the private collection of Charles H. Schiller, and in it was the variegated pine-apple in fruit; also the pitcher plant—Nepenthes—and many orchids in full bloom. The amateur show of cut flowers was very large and attracted much attention, but as is usual, was completely overshadowed by the collection of our friends, the Vicks. Theirs filled over 70 feet of table room, and comprised 75 varieties of gladioli, 150 varieties of named dahlias, 40 of phlox, and 60 of verbenas—the whole so arranged as to give every shade and mixture of color, and it was very attractive and instructive. They richly deserve what we wish them—success. I must not fail to mention a collection of seedling gladioli shown by the RURAL'S correspondent, E. P. Powell, of Clinton, N. Y. They are certainly promising.

There never has been a worse time for State fairs than this, as it has rained every night and four out of the six exhibition days. There is only one place more disagreeable in a rain storm than a fair ground, and that is in the woods fishing. It has rained so much and constantly that mud is everywhere. In some places it has got so deep that it is with difficulty that forage can be distributed to the stock. The only criticism, aside from shutting off some departments that should have been allowed, has been in selling lager beer upon the grounds. While I have seen only a single drunken man at the fair, I have seen many country boys enticed to the beer stands because of the added respectability given by the Society in allowing them upon the grounds. I devoutly hope that next year the decent element may be strong enough to obliterate even this last objectionable feature. Surely the New York State Society is too influential to lend its influence for evil.

J. S. WOODWARD.

SUFFOLK COUNTY, LONG ISLAND.

FAIR AT RIVERHEAD.

(RURAL SPECIAL REPORT.)

SUFFOLK County is the oldest, and agriculturally considered, one of the best in the State. Situated at the eastern extremity of Long Island, it has the choice of markets in two directions—Boston and other New England cities and New York. The raising of strawberries for the New England markets has heretofore been very profitable; but this year the crop was so plentiful as to reduce the price below the cost of transportation; the result was the partial loss of a fine crop. The county is noted for its cabbage and cabbage seed, cauliflowers and potatoes. It has also been the home of some of the most famous horses this country has produced, and within its boundaries are many first-class stock farms. As might be expected, the annual fair of such a section—somewhat isolated as it is, being bounded on three sides by water—is a notable event and largely patronized. The exhibits and patronage are chiefly local, and the people seem to come together as to a family reunion. The fair on the whole is an ideal county fair, largely local in its character, comparatively free from the excitement of horse racing and sideshows of questionable character, and devoted to the interests of the residents of the county.

The exhibition of cattle was not large, but for quality would compare favorably with any fair in the State. David Carll, of the Dix Hill Stock Farm, was one of the largest exhibitors. One building was devoted to a fine exhibit of poultry. Wyandottes and Plymouth Rocks were the chief attractions, but almost all the leading breeds were represented. The show of sheep was very fair, considering the fact that Long Island has not been noted of late for sheep raising. As might be expected, the fair excelled in the exhibition of vegetables. Mr. J. W. Smith, of Peconic, exhibited an unusual variety of beets, the result of his own selection. The largest pumpkin was raised by Mr. B. F. M. Treary, and weighed 158 pounds. The largest watermelon (an Iron-Clad) was shown by A. R. Norton; weight 49 pounds. A new tomato, the "Tycoon," attracted much attention both on account of its uniform size and shape and its beauty. It originated with Messrs. Reed & Funrell, of Huntington, and will be controlled by Messrs. Hallock, Son & Thorpe. Its chief merit is said to be its remarkable earliness, which, combined with its solidity and firmness, uniformity of size, and smoothness and beauty, should make it a desirable acquisition.

Peanut culture in Suffolk Co. has been encouraged by Mr. Austin Corbin of the L. I. R. R., and there was a considerable display of the goobers. They were of large size and excellent quality; but their culture so far has not been a success. "G."

WESTCHESTER COUNTY, N. Y., FAIR NOTES.

(RURAL SPECIAL REPORT.)

THE first annual fair of the Society of Agriculture and Horticulture of Westchester County was held on the Old Fair Grounds near White Plains from the 27th of Sept., to Oct. 2nd. The attendance was very large and it is probable that the managers will be so far encouraged as to make some needed improvements.

The cattle exhibit was very fine, Holsteins leading, closely followed by the Jerseys. An enormous steer variously estimated from 2,500 to 3,000 pounds, attracted much attention. The poultry show was very few in number and poor in quality. The implement department was rather slim, the chief exhibit being made by Mr. H. B. Grifling, of New York.

A novelty in shovels and spades was exhibited by the Calef M'f'g Co. These are made with pointed teeth corrugated and tempered; and it is claimed that they work very much more easily than the ordinary smooth-edged spade or shovel.

The best parts of the grounds were given over to the fakirs, and judging from the crowds which surrounded them, they were the chief attraction.

We hope the managers will re-arrange the grounds, assigning the side-shows to a less conspicuous place, and set out a few good shade trees. We should also like to see more attention paid to poultry, sheep and other forms of exhibit of interest and value to farmers, and less to horse racing.

There is no reason why Westchester, one of the richest counties in the State, should not have a first-class fair, and it would have, if the farmers would take the matter in hand and compel the managers to recognize their rights. J. H. G.

BAY STATE AGRICULTURAL FAIR BOSTON.

(RURAL SPECIAL REPORT.)

First fair of a new society: very fine cattle show; other live stock exhibits fair; moderate fruit and vegetable displays; implements in abundance; no objectionable features.

THE first cattle show and fair of the Bay State Agricultural Society was held in the building of the Charitable Mechanics' Association, Boston, on October 5, 6, 7 and 8. It was perhaps the most successful cattle and poultry show ever held in New England. The exhibition was entirely under cover, and the show ring was small so that the stock could not be exhibited to the best advantage. The cattle were in charge of Mr. E. E. Bowditch, and some idea of the magnitude of this portion of the exhibition may be formed from the fact that of the 650 stalls only a few were vacant. The beef breeds were represented by some fine specimens of Herefords and Short-horns. There were very few of the polled varieties, which are coming into favor in the North and West. The milch and butter breeds were perhaps never so largely represented at any former New England fair, the Holsteins from Houghton Farm alone filling one row of stalls. The Jerseys came next and attracted even greater attention. Unfortunately they were somewhat scattered, owing to the limited area of the basement in which the cattle were kept. Guernseys, Ayrshires, Devons, Swiss and other breeds were also exhibited.

The horse department, in charge of Wesley P. Balch of Boston, included all the leading breeds. Some fine blooded stock from Kentucky were shown, also some imported Arabian horses. The large number of sheep exhibited indicated a revival of the sheep industry in New England. The swine exhibit was good. The show of poultry was excellent. Although the fair was at a season when poultry do not show to good advantage, yet the specimens were of remarkable excellence.

The embellishment of the main hall with a grand floral display of rare and beautiful flowers and plants contributed from the private gardens about Boston, was a feature of the exhibition which managers of other fairs would do well to make a note of. The show of vegetables and fruits although fairly good, did not equal the other departments for merit or variety, with the exception of the display of pears and apples. The special prize of $50 for the best collection of apples offered by the club of which Marshall P. Wilder is President, doubtless had much to do with the fine exhibit of this fruit.

The best space in the implement department was unfortunately occupied by two or three of the leading local dealers. The exhibit, however, was the finest and most complete I have ever seen. A fine showing was made by the Belcher & Taylor Co., of Chicopee Falls, and by the Ames Plow Co., Jos. Breck & Son, and the other implement houses of Boston. The dairy apparatus department was unusually complete. The Vermont Farm Machine Co., and Porter Blanchard's Sons, and others made a large exhibit of apparatus aside from the dairy. The "Working Dairy" in charge of Maj. Henry E. Alvord, was a feature of the exhibition. The Davis swing and the Blanchard dash churns and various other dairy appliances were in operation during the fair, and this department attracted more attention than any other.

Among the novelties shown in the implement line was the Cheney Lawn Mower, modeled somewhat after the Eureka Mower, the knives being directly in front of the wheels. O. N. Robertson exhibited a chain-hanging cattle stanchion, which combined simplicity of construction, ease of operation, and efficiency. The show of mowing machines was large, including the Warrior, Buckeye, Bradley and other leading machines

One of the latest perfected road machines of the American Road Machine Co., of Kennett Square, Pa., attracted much attention.

The Domestic Manufactures Department included all kinds of domestic and fancy articles. One of the best features of the whole exhibit was the absence of games of chance and drinking, and to a certain extent, of smoking also. There were no fakirs or sideshows of any kind. The managers relied exclusively on the merit and educational value of the exhibit to draw visitors, and the fact that they were so largely successful, makes us hope for better things of agricultural fairs and cattle shows o fthe future. G. G.

FAIR NOTES.

THE KANSAS CITY FAT STOCK SHOW, Oct. 23—30, promises well. Prof. Sanborn well says that such shows are for money spending rather than for money making. The money is made too. Every one of these exhibitions encourages a love for better stock. Those who attend may see for themselves the vast difference between scrub and blooded stock, and all who read of the awards are encouraged to weed out the scrubs. Special premiums are offered for sheep. The sheep business is looking up, and steps are to be taken to encourage it by all reasonable means. Sheep produce more gain for 100 pounds of food than do cattle. Lamb growth is made almost entirely on summer feed, which costs only one-fourth of winter feed. Wool is now improving in price. There is every encouragement for shepherds. They should study the various breeds, and see which is best adapted to their own location and needs. Whenever there is a good exhibition of sheep within easy reach, it is the duty of the good shepherd to visit it.

THE meeting of Northern settlers at Raleigh N. C., Oct. 25—29, promises to be a success. Western North Carolina and Eastern Tennessee are in many respects the best sections of the South for Northern settlers. Those already there will make a splendid exhibit. The enterprise is an admirable one.

AN important Bee Keepers' Convention will be held at Indianapolis Ind., Oct. 12—16. Delegates from the North American Bee-Keepers' Association, the North Western Association, the Indiana Association and several other smaller associations will be present.

THE catalogue of the Geneva, N. Y., Fair contained 40 pages of advertisements. Too much. The matter relating to the fair was crowded into a very small space. Only a small portion of the premium money—$150—was offered for racing. One race for horses used in the grocers' and butchers' businesses was advertised. Special premiums were offered for the heaviest baby, the best-looking baby, for a married couple and for essays and fancy work by children. We were sorry to see a keg of beer offered for the best draft stallion and a gallon of whisky for the best three-year-old Holstein cow. Honest animals will be ashamed of themselves at winning such prizes.

THE Thirteenth Annual Convention of the Butter, Cheese and Egg Association will be held at Chicago, on November 10, 11 and 12. This is an association composed chiefly of dealers; but its "procedings" are generally quite spirited and the mass of statistical information it gives to the public each year is very instructive.

Implements, etc.

NEW IMPLEMENTS.

A MACHINE has been invented by which it is proposed to lift weights by means of a pendulum attachment. A large drum is fitted with a rope to which the weight to be lifted is attached. The pendulum is a heavy weight attached to a stiff bar. It is fitted with a tooth-like arrangement at the top, which fits into holes on a collar fitted to the shaft upon which the drum hangs. The motion of the pendulum slowly turns the drum and the rope is wound up. The motion must be very slow indeed. We do not see why a man with an ordinary windlass could not raise a greater weight in a shorter time than can be done with such a machine.

A NEW churn has been invented. By means of cog wheels and a pitman, the motion is communicated to the dasher so that the operator can stand erect and simply pull a lever back and forth. It does away with the lifting and pushing of the old dash churn, or the grinding of the swing churn. We should judge that more power would be necessary to work it, though the more comfortable position allowed may compensate for extra work.

MAYFIELD'S fruit picker is a patented device for packing fruit from the ground. A long pole is furnished at the end with a sharp-edged bow from which a canvas tube runs to a bag on the ground. The fruit, cut off by the sharp edge, is expected to run down the tube and drop into the bag. We see no reason for making four motions to secure an apple when, by means of a good ladder and basket, it could be secured by two.

Dairy Husbandry.

THE QUEEN OF THE DAIRY.

WHEN Echo, the wonderful Holstein cow, made a record of 23,775 pounds eight ounces of milk in one year, it was thought that the limit of milk production had about been reached. But now even this wonderful record has been beaten. The Holstein-Friesian cow Clothilde has just closed a year's test, giving 26,021 pounds two ounces of milk in a year. This easily singles her out as the most wonderful cow in the world—over 13 tons of milk in a year. Clothilde is a member of the Lakeside herd of Messrs. Smith, Powell and Lamb, Syracuse, N. Y. She was selected by a member of the firm in North Holland as an unusually fine specimen of the breed, and imported in October, 1880. She dropped her first calf January 24, 1881, when but 23 months old, and gave that year 8,964 pounds two ounces in 11¾ months. As a three-year-old she gave 15,622 pounds two ounces, and as a four-year-old 17,930 pounds three ounces, far surpassing the previous records in both instances. She is described as a cow of unusual vigor, constitution and substance, with remarkable digestive organs, a capacious chest, very large barrel, and has the broadest and straightest back and hips ever seen on a Holstein-Friesian cow. Her head is long and clean, her neck is lengthy, clean-cut and fine, her coat soft and silky, skin mellow, her veins and udder large and well developed. Her last calf was dropped August 17, 1885. The following table tells the story of her test:

	LBS.	OZ.
August 18, 1885, to September, 17, 1885, inclusive	2382	4
September 18, 1885, to October 17, 1885, inclusive	2311	6
October 18, 1885, to November 17, 1885, inclusive	2218	11
November 18, 1885, to December 17, 1885, inclusive	2091	8
December 18, 1885, to January 17, 1886, inclusive	2238	7
January 18, 1885, to February 17, 1886, inclusive	2237	7
February 18, 1886, to March 17, 1886, inclusive	1967	4
March 18, 1886, to April 17, 1886, inclusive	2110	1
April 18, 1886, to May 17, 1886, inclusive	2195	15
May 18, 1886 to June 17, 1886, inclusive	2222	3
June 18, 1886, to July 17, 1886, inclusive	2080	5
July 18, 1886, to August 17, 1886, inclusive	2045	11
Total	26,021	2

Average per day for the whole year, 71 pounds 4¾ ounces.

Highest day's yield, 88 pounds four ounces on her second month in milk.

Smallest day's yield, 57 pounds 14 ounces on the third day in milk.

The next lowest day, 58 pounds 12 ounces, on the fourth day before the close of the year.

There appears to be no reason to doubt the accuracy of this test. Affidavits are made by E. A. Powell, H. H. Gibbs, (who milked the cow), S. Burchard, S. Hoxie, Cecil Palmer, Prof. I. P. Roberts and Gideon C. Ferris, which fully cover every period of the test.

Maj. H. E. Alvord furnishes a statement showing that he is fully convinced as to the accuracy and honesty of the test. Maj. Alvord, it must be remembered, is the official tester of the A. J. C. C.

The grain feed given during the test was composed of wheat bran and oatmeal, half and half by weight, which weighed twenty-four pounds to the bushel. From the date of commencing her record until green feed was gone in October her average daily feed was 12 pounds (16 quarts) of this mixture, with pasture and green corn when put in stable to milk. During the Winter she was fed an average of 18 pounds (24 quarts) per day of this feed, the amount varying at times according to her appetite and condition, with what corn silage and dry hay she would eat, and four to six quarts of carrots per day. After soiling crops were ready for feeding in the Spring, her grain feed was gradually reduced to 12 pounds per day, with green rye, green oats and green clover for soiling, with pasture of clover and timothy. During the months of June and July, during the flush of green feed, she ate very little grain, not over six pounds per day. She had no other kind of grain or feed and no liquid of any kind but water, which she was given as often as she would drink.

Messrs. Smith, Powell and Lamb will publish a full account of the test in a neat pamphlet which will be well worth reading.

The Herdsman.

OUR ANIMAL PORTRAITS.

JERSEY HEIFER, GOLDEN SKIN 2d.

Long before Jersey cattle became notable for the richness of their milk and the high quality and abundance of their butter, they were favorites in the great parks attached to the lordly country houses of England's proud nobility and gentry. They were kept more for ornament than for utility. Color and form were more highly prized than udder and escutcheon: fancy points were more esteemed than genuine merit. Instead of the lean, scraggy condition characteristic of the deep-milking dairy Jersey, the ornamental Jerseys were always sleek, well-rounded and remarkable for their handsome, thoroughbred appearance. They corresponded well with the deer that clustered under the umbrageous trees or wandered through the deep grasses of the lordly demesnes. There are in England thousands of Jerseys whose easy lives are thus spent for ornamental purposes to-day. And are they not splendidly adapted for it? Just look at the heifer Golden Skin 2d, shown at Fig. 391. What a graceful, beautiful creature! What a charming adjunct must a herd of such deer-like beauties be in a vast ancestral park lavishly laid out by successive generations with all the art that improves nature!

Golden Skin 2d is Island-bred, having been bred by Mr. F. Le Brocq, St. Owens, Jersey. She is whole-colored, and was calved June 2, 1884. She won several first prizes on the Island before she was imported into England where she has been a frequent prize-winner, her latest triumphs having been the capture of the first prize at the Royal Show at Norwich, and the Bath and West of England, and Royal Counties' Shows in 1886.

CENTRAL-WEST STOCK NOTES.

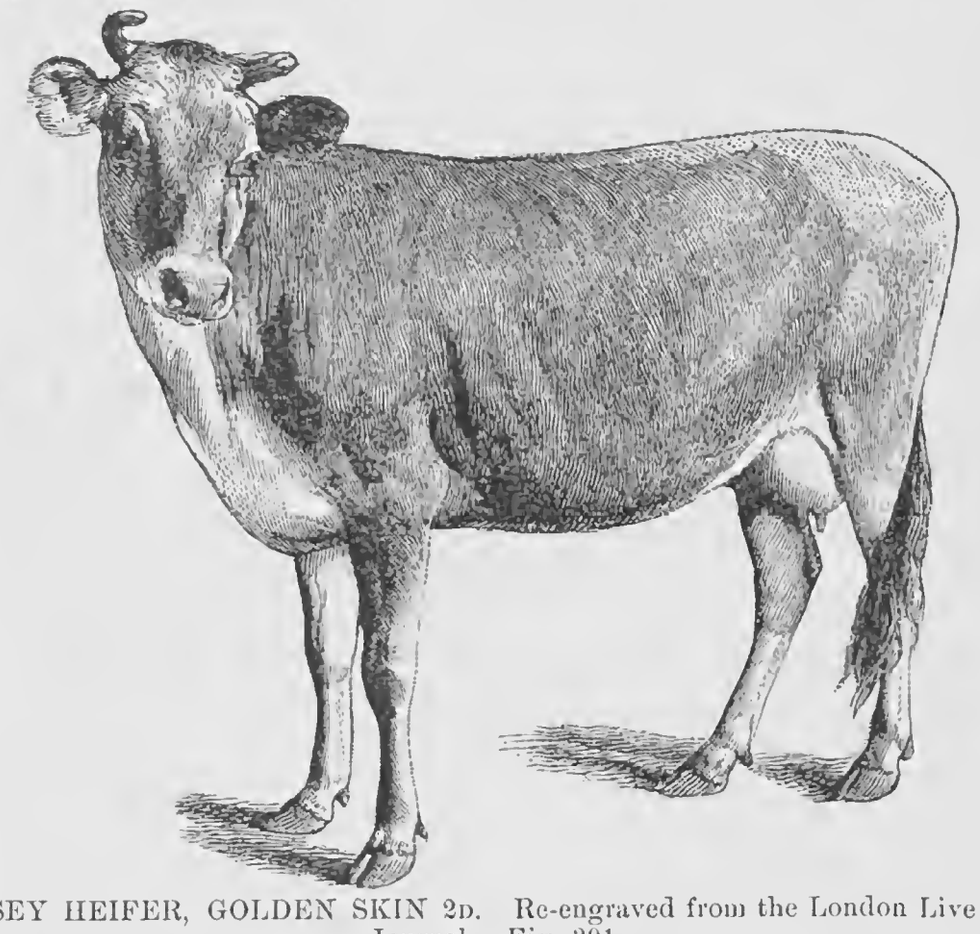
PROF. G. E. MORROW.

It now seems certain we have an outbreak of contagious pleuro-pneumonia in and near Chicago. The official and consulting veterinarians of high repute are reported unanimous in this decision, and I accept their decision as final. The fact that several thousand head of cattle have been exposed to the disease in the distillery feeding stables in which it has been found, makes the task of the State Live Stock Commission one of very serious nature. It is understood they have decided to have all the exposed cattle slaughtered. As yet the full history of the outbreak, or the full extent of possible exposure, has not been determined. It is much to be hoped the authorities, veterinary and civil, will not be embarrassed in their work by much renewal of the kind of criticism indulged in two years since.

In a number of Western States "hog-cholera" is prevailing to a serious degree. In some cases farmers in the great corn and hog raising regions have grown accustomed to outbreaks of this disease, and little may be said about it even when there is large loss. In other cases sensational reports are published, in which the loss is greatly magnified. Within a few days past Dr. Smith, of the Bureau of Animal Industry of Washington, Dr. McIntosh, our University Veterinarian, and the writer have visited the vicinity of Sadorus, in Champaign County, Ill., where much loss has occurred during the last three or four months. There is much variation in the symptoms as found in different herds. In some the pigs frequently die within a few hours after the first appearance of ill health; in others they last for several weeks before dying—in some cases recovering. In some cases the lungs are much affected; sometimes the spleen is also. In other cases the appearance of injury is mainly confined to ulcerations in the intestines. These have been counted by many as the one most characteristic symptom of the disease. While some still deny the contagious or infectious character of the disease, the evidence that it is readily communicated seems conclusive. Nor will it do to charge careless or bad management to all who suffer loss.

Recent rains over much of the Central West have done much to refresh the pastures and to encourage farmers. The low prices for "stockers" and "feeders" in the Chicago and other live stock markets, show that farmers are not usually anxious to supply themselves with cattle for future feeding. There seems little probability of any considerable advance in the price of beef cattle during the Autumn, and almost certain that very large numbers of only partially fattened cattle will be thrown on the markets; not only from the ranches in the far West, but from many farms where the drought has decreased the supply of food.

Notwithstanding the low prices, we are, on the University farm, feeding rather more than the usual number of steers for sale some time in November. We have not yet found any more economical mode of beef-making—or a more profitable mode—than to graze good two-year-old steers during the Spring and Summer without grain, if the pastures continue good, commencing feeding the new crop of corn from the middle to the last of August, and continuing this not more than 90 to 100 days. This is fed "in the ear," hogs "following" the cattle and receiving nearly all the undigested grain.



JERSEY HEIFER, GOLDEN SKIN 2d. Re-engraved from the London Live Stock Journal. Fig. 391.

It is noteworthy and encouraging that with a full recognition of lowered prices for pure-bred as well as common and grade stock, the leading fairs of the West have probably never had larger or better displays of live stock than have been found this year. I hope and believe this may be true of the Fat Stock, Horse and Dairy Show, to be held in Chicago in November next. It has seemed clear to me that this exhibition has done more for the live stock interests of the country than any other one show or fair. Certainly it has been of greater interest and profit to me than any other I have attended. There has been criticism on the management for expanding its field, but I do not see that these are well founded. I especially hope the Dairy Show may be a surprise to all in its extent and excellence. Never before would greater good have come from a show of dairy products. It has seemed to me there is a danger of over-reliance on the good effects of the oleomargarine legislation. The prizes offered are very liberal, and so distributed that it will not be possible for a very few exhibitors to secure them all.

As I have done in former years, I again promise to all Rural readers who attend this show much of pleasure and profit, and especially hope there may be many from the more Eastern States.

University, Champaign, Ill.

STOCK JOTTINGS.

COMPETITION IN WOOL BUYING.

The prices of wool have been quite satisfactory this year to the growers in Montana and the neighboring Territories. As elsewhere, the prices have gone up because the supply is unusually small in comparison with the demand; but the rise has been hastened and increased by the competition between agents and buyers for Chicago with those from Boston and Philadelphia. Until lately the latter had things all her own way; but during the past season the Lake City men have been running them closely. It is said that Montana wool consigned to Chicago last year netted the shippers from one to two cents more per pound than Boston and Philadelphia returned for precisely the same kind of wool; hence the consignments to the former this season threatened to be unusually heavy. To prevent this, the Eastern men, instead of confining their efforts mainly to obtaining consignments, according to the usual practice, bought quite heavily at prices that would make the wool cost them from 26 to 27 cents in Boston or Philadelphia, paying from 22 to 24 cents per pound or even more for large lots at the railroad stations. The Chicago people sought consignments chiefly, advancing 20 to 22 cents per pound for such wool as the Eastern men bought outright for from 22 to 27 cents. In selling, however, the Eastern people sell generally on 60 days' time; while the Chicagoans nearly always sell for cash. The great advantage Chicago has lies in the difference in freight. The rate on wool shipped from Fort Benton or Helena, Montana, to Chicago is $1.35 per 100 pounds; while the rate to either of the Eastern rivals is about $1.95. Over 600 woolen mills are nearer to Chicago than to either of the other cities, and it is cheaper for these to get their wool from Chicago (whence they draw the rest of their supplies) than from Boston and Philadelphia, as in the latter case the staple would have to pay freight to the market east of them and back, which, of course, is not the case when the purchases are made in Chicago. Honest competition between buyers is always a blessing to producers. The papers of all the three great wool markets have had pretty lively discussions on the subject of late.

Marine Live Stock Insurance.—Statistics show that about half the live stock exported from the United Kingdom go to Canada. A large proportion of these ultimately find their way into the United States. Either they are shipped through Canada to owners in this country or Canadian importers sell them to stock owners on this side of the line. The exports from Canada are also quite heavy, and many American cattle are shipped in bond from Canadian ports. Marine insurance companies in the Dominion have suffered some heavy losses in the live stock business, due to sharp rivalry, which reduced rates, raised commissions and led to poor inspection, so that often unsound stock was insured as sound, or inferior stock taken at high values. The companies have just formed a pool, the management of which issues a schedule of rates and provides for better inspection. The losses are now divided among the companies in relative proportion, and the expenses being greatly cut down, premiums are written unusually low. During the summer months on the "all-risk" plan, including mortality and jettison, rates were 1¼ to 1½ per cent. on cattle and three to four per cent. on sheep. September being the equinoctial month, rates were advanced to two to three per cent. on cattle and five to 5½ per cent. on sheep. Some companies retain only the mortality risk, and re-insure total loss and general average, while some shippers, in view of the small mortality, take their own risk as to mortality, and only insure against total loss and general average.

LARGE CATTLE IN ANCIENT BRITAIN.

It is generally supposed that in ancient Britain, even as late as the Roman times, there were only small domestic cattle of the type of the Scotch Highlanders and old Welsh sort—of the strain of Bos longifrons—and that the large cattle, to which the Chillingham herd belongs—the Bos primogenius stock—were introduced about the time of the Saxon and Danish invasions. The Urus, however, is supposed to have been the parent race. Animals of this race are described as almost equaling an elephant in size; but with the form and color of a bull. They are supposed to have been domesticated among the Swiss lake-dwellers, but then and down to historic times they abounded in the wild state through the forests of Europe. Youatt tells us that "in almost every part of the continent and in every district of England skulls, evidently belonging to cattle, have been found far exceeding in bulk any now known," and these are supposed to have belonged to that mighty race. A head found in Perthshire and now in the British Museum, measures a yard in length, while the span of the horn cores is three feet six inches. Some large bones have lately been exhumed in England which must have belonged to cattle six feet high or more at the withers, and the body must have corresponded in length, thickness and depth. Our largest Short-horns and Herefords would have seemed small beside these monsters.

Red Polls.—The more I see of Red Polled cattle the better I like them. I am a great friend of the Ayrshires, but they have horns, and as a horse does not need horns I am beginning to doubt if cattle do. E. D.

Bucy Co., Mich.

Horseman.

CARE OF THE HORSE.

I often pass men on the road who are driving horses so foul that I don't see how they can travel. It is a shame to allow horses to get into such a condition. They should have their sheaths cleaned out at least twice a year. My experience leads me to believe that many of the diseases that we doctor horses for are due to a foul sheath. I know one case where we doctored a horse for a kidney trouble, only to find that dirt had so formed at the end of the yard that he could hardly urinate. We make a regular business of cleaning our horses twice a year—once in Spring and once in the Fall. Care should be taken to see that there are no open cuts on the hand when doing so, for such will be made very sore. I find it better to put on a pair of old kid gloves. A gentle horse will not make much trouble, but it requires patience to handle a nervous animal. The hand should be thrust into the sheath until the head of the yard is felt. This can then be slowly drawn out. The scales should be picked away, and the whole well washed with warm water and Castile soap. This is the most disagreeable job connected with horses; but it is a very important one. The horse will travel better and do better in every way to pay for the operation. T. C.

Lenawee Co., Mich.

HIGH-BRED HORSES NOT SUITABLE TO WORK IN THE COLLAR.

The reason of this is that their shoulders are so slanting that their sharp points prevent the collar from setting nicely, which throws the weight of the draft of the load so much against the points as to greatly lessen the power of the horse in drawing. This is also a serious discomfort—even painful at times—and is liable to make sore shoulders. Collars, therefore, should never be put on a horse with quite slanting shoulders—but the breast band, or Dutch collar, as it is also called, should alone be used instead of the neck collar when harnessed. Horses for light vehicles and carriages should have moderately sloping shoulders; in those for heavy road wagons, city carts and trucks, a more upright shoulder is the best, as such are not wanted to trot; a square fast walk is all that is requisite.

A. B. ALLEN.

Poll Evil.—We had a horse afflicted with the poll evil. We were just at the point of taking him to the horse doctor when we read Dr. Kilborn's article on the disease in the

RURAL of March 27. We tried this treatment and cured the horse, so that we feel like recommending it to all. E. M.

Fairmount, Kans.

The Swineherd.

"ISN'T HE A BEAUTY?"

WE are somewhat inclined to the opinion that our readers will at once decide in the negative when they glance at the little porker shown at Fig. 392, page 693. There is very little "pure blood" about him. He is a decided "scrub." He is evidently pretty well able to make his wants known, for his mouth and lungs are finely developed. His head is the largest part of him. But if you all object to his personal appearance, the English laborer, who holds him up for inspection, will prove a very active minority. To him the little fellow is surely a "beauty," and no one shall ever say one word against him. The true pleasure of pig-keeping does not come to the breeder who can show his well-filled pens of shapely animals. The poor man who nails up a few boards in one corner of the garden and places his little friend therein, knows the true pleasure of pork making. "Handsome is that handsome does" applies to pigs as well as to men. The small porker in the picture will be an important member of the family. There is much depending upon him. He has taken the responsibility of providing much of the meat for the next Winter. There will be sorrow in the family when he comes to be killed. The children, especially, will feel that they have lost a good friend. The pig has been driven out of polite society. He is obliged to endure a great deal of censure—much of it unjust. He has his place in romance and poetry if people would only give him a chance. In one of Mrs. Cook's admirable stories a pig brings about a wedding. The pig jumps out of his pen and frightens the heroine of the story, a maiden lady of somewhat uncertain age. She rushes for help, and straightway the hero marches upon the scene. The pig overturns this gentleman, and stretches him upon the ground with a broken leg. The lady could not do otherwise than have her wounded knight brought into her house to be cared for. The sequel of the story is easily reached.

Pomological.

SIMON'S PLUM.—(*Prunus Simonii.*)

A LITTLE tree of this new and singular plum was received from Ellwanger & Barry, Rochester, N. Y., in October, 1884. It is now 10 feet high, with a stem 2½ inches in diameter, though it grows in the center of a bed of perennial phloxes, lilies, etc., which, during the growing season, shade the entire stem (or trunk) from the sun. The tree during the Winter may be said to occupy a northern exposure. It has never been injured in any way. It bore one plum (if plum it may be called) the past season, which was plucked August 8. The shape and appearance were more those of a good-sized crab apple than of a plum. The color was a dull, dark red, with lighter shades here and there. The suture was obscure; the skin hard. It was eaten, after sitting for its portrait, shown at Fig. 389, August 12. The

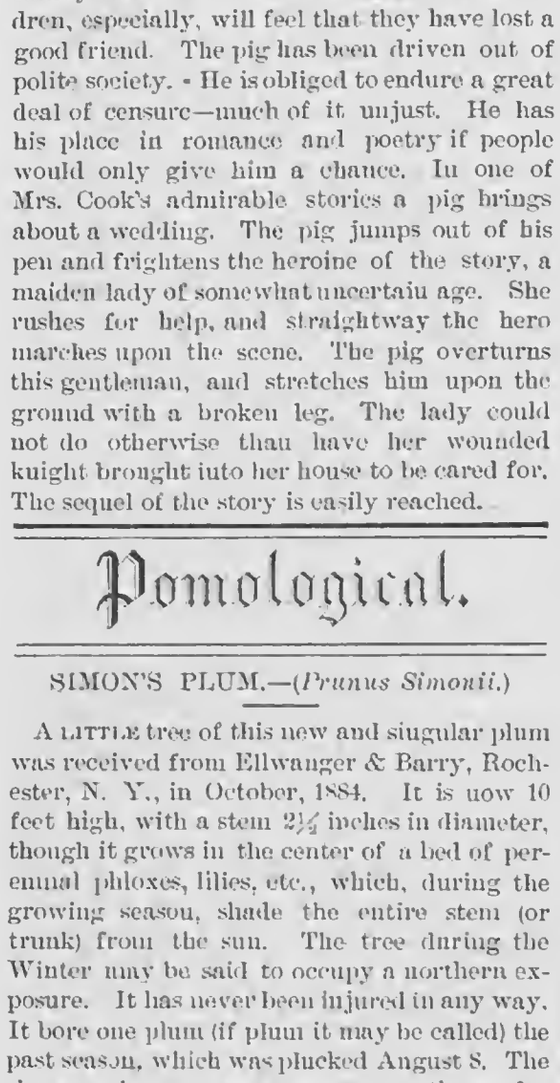


Fig. 389.

flesh, which clings to the stone somewhat, is thick and of the consistency of a firm plum, with a distinct peach-pit flavor, though by no means disagreeable. The pit is corrugated like that of the peach. The pit is shown with a half section at Fig. 390.

PRUNUS SIMONII.

PROF. J. L. BUDD.

THE RURAL says: "Tell us what you know of Prunus Simonii." I do this willingly at this time, as interested propagators are quoting, in circulars, detached sentences I have written in regard to it without putting in the qualifying words, which should go with new things yet under trial.

I first met with it in bearing in the Valley of the Moselle, in Eastern France, where it was introduced from Northwest China by Simon Louis, of Metz, through his brother-in-law, Eugene Simon, when he was French

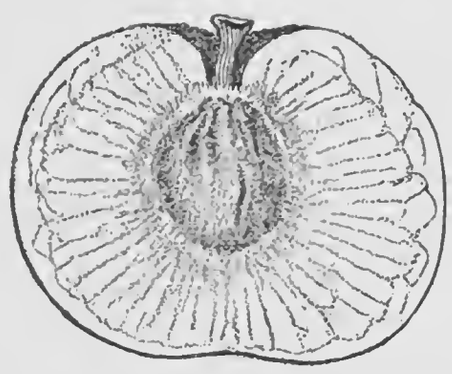

Fig. 390.

Minister at Pekin. Mr. Louis seemed to place quite a high estimate on its fruit for culinary use, especially for growing in sections where the peach failed to do well. After ascertaining that the tree endured the Summers and Winters of Iowa about as well as the Chickasaw Plums, and after tasting its peach-flavored sauce, I naturally recommended it for trial, and published Mr. Louis's estimate of its value. But this was followed by the positive assurance that it would not be apt to be worth growing in sections where the peach, nectarine, or the best apricots succeed moderately well. I said then, and believe now, that on the northern borders of the peach belt it is worthy of trial, as it comes nearer to the peach and nectarine in flavor, when cooked, than any variety of the plum I have ever met with.

Some good botanists of Europe agree with the writer in the opinion that in tree, flower, and fruit it comes nearer to the almond and peach than to the plum family, and that crosses with it of both peach and plum may bring interesting and valuable results. Aside from its possible value for fruit, I may add that it makes a neat-foliaged, pyramidal tree for the lawn or walk border.

Ames, Iowa.

FROM P. J. BERCKMANS.

I HAVE not fruited Prunus Simonii, but have a row of the trees planted in an orchard, and now two years old. The trees are of erect and compact habit, almost like Lombardy Poplars. Foliage luxuriant and bright green. The trees are of rapid growth.

Augusta, Ga.

FROM ELLWANGER & BARRY.

THE Prunus Simonii is a novelty—quite distinct in tree and fruit. It is quite as much peach as plum. Our tree is bearing, and young nursery trees have borne.

Rochester, N. Y.

Horticultural.

THE POPULAR GARDEN.

WILLIAM FALCONER.

BY this I mean a farmer's yard or small city lot, just such a garden as anybody may have, and which should be ornamental and useful. If it is very small, don't crowd it up with trees, but set out some trees along the street in front of your property, for shade. You can have vines on your fences and up the pillars of the piazza. If the garden is very small, you may need it all in culinary crops, but even then you can have lots of flowers along the edges of the pathways and around the house. If of fairly good size, have trees, shrubs, flowers and a lawn and kitchen garden. Keep your trees pretty much together in belts and clumps; or if isolated, in the vicinity of each other. Keep shrubs in the same way. Don't cut up your lawns much. Have an open, smooth piece of lawn in front of the house big enough for a croquet or play ground. Avoid many flower beds. Round, oval and oblong-square are the best forms. It is easier to cut out a flower bed in the sod than it is to fill it with handsome plants and keep it full all Summer. Never cut out flower beds in the middle of a lawn, but rather towards the outer-edge of the lawn or near the walks.

THE FENCE should be neat, strong and efficient; it may be a rail, wire or picket fence, a stone wall or anything else equally well adapted for the purpose, comely, and consistent with its surroundings and one's means. Let the gate also be neat, strong and serviceable, and always in good repair and working condition.

THE WALKS.—Don't have many. Let all you have be needed and so disposed as to be "short-cuts" to the points you wish to reach, be it the front gate, the back gate or barn. While gently curved walks are pleasant to look upon, meaningless "wiggles" are absurd. Remove an obstruction rather than "wiggle" around it.

THE SURFACE OF THE LAND should be even. Reduce the bumps, fill up the holes, and make even the puckered surface. You may retain the rolling, wavy nature of the land.

DRAINAGE. — If the land is heavy, low, springy or mucky, it will need under-draining. Also make provision for readily draining off surface moisture, which otherwise would be apt to collect into pools in Winter or after a heavy shower in Summer.

SOIL.—Make the best of whatever it may be. To begin with, subsoil it all over, but remember to keep the subsoil in the bottom and the surface soil at the top. If the soil is heavy, good drainage, a thorough breaking up and addition of sand, ashes, decayed stable manure or other light material will greatly lighten it; if light or sandy, a good addition of clay, heavy loam, muck or rotted cow manure will help it much.

SOD.—After the ground has been drained, well broken up and pulverized, firmed and smoothed, sow to grass, using clean Red Top, or Blue Grass or an equal mixture of both. Sow after the first good rain in September, or in Spring just as soon as the ground is mellow. Roll or tread the surface evenly and firmly after sowing and raking in.

ENRICHING THE LAND.—At the first preparation of the land you may incorporate into the soil all the rotted manure you want to, and mix it well with the earth; but after that, whatever is given as a dressing to lawns or nourishment to trees and shrubs let it be given as a mulching, and whatever to flowers or culinary vegetable crops let it be plowed, dug or forked into the soil, but always kept near the surface.

PLANTING TREES. — After fencing, road making and preparing the ground are completed, planting is in order. Now look to the future. Know what trees you like best, what sorts you need and why you need them, and be sure that your selection is the best that can be made for the purpose; then go ahead and plant your trees. Plant the large ones towards the outer boundary of your lot, and don't crowd them around your house or dot them all over your ground.

LANDSCAPE EFFECT.—Talking of landscape gardening in a city lot of a few rods or the farmer's ordinary garden patch seems to me to be so much twaddle. In parks and private gardens of several acres landscape effect must be considered, and in these cases landscape architects, as Olmsted, Lee or Miller, are engaged, or should be, to plan and lay out the place, and afterwards professional gardeners should be employed to take care of it. The popular garden should always be subservient to our means, convenience and taste; of course we must try to make it as pretty as we can.

KIND OF TREES.—Sugar and Norway Maples for shade; Australian Pine and White Spruce for shelter; Yellow-Wood, Red-Bud, Paul's Thorn, Silver Bell and Chinese Magnolia for beautiful blossoms; the Fern-leaved Weeping Birch and Weeping Deciduous Cypress for elegance; the Golden Oak and River's Purple Beech for color in foliage; the Fastigiate Oak and Chinese Cypress for columnar form; and the Colorado Blue Spruce, Nordman's Fir, Douglas Fir, Red Pine and dense White Pine as evergreens. But this is not a tithe of the available and desirable species.

AVOID TREES that don't thrive in your neighborhood or are much subject to insect pests. Elms are robbers of the soil; horse-chestnuts drop their leaves early; and catalpas are very messy.

SHRUBS.—Thunberg's, Van Houtte's and Fortune's Spiræas, Japan Quince, Japanese Diervilla, Persian Lilac, large-flowered and fragrant mock-oranges, deciduous azaleas, African and Chinese tamarixes, dentzias, snowballs, rose-acacias, roses of sorts, althæas chaste tree, golden hypericum and Large-flowered Panicled Hydrangea.

VINES. — Chinese Wistaria, clematises, akebia, honeysuckle, roses, Trumpet Vine Virginia Creepers, Pipe Vine, Climbing Wax-work, Silk Vine and Japanese Ivy (Ampelopsis).

HARDY PERENNIALS.—Tulips, poet's narcissus, old-fashioned daffodils, wake robin Lily-of-the-Valley, irises, lilies of all kinds, yellow and white day-lilies, Soloman's Seal, fraxinella, pæonies, Double-flowering Fern-leaved Spiræa, panicled gypsophila, Lance-leaved Coreopsis, evergreen candytuft, pentstemons, moss-pinks and late phloxes, larkspurs, double-flowering varieties of feverfew, butterfly weed, bee balm, yuccas, David's Clematis, bell-flowers, double white achillea, yellow anthemis, pink showy sedum, Japanese anemones and mist flower. Also Sweet Williams, hollyhocks, Canterbury Bells and pansies.

The Vineyard.

NIAGARA GRAPE SEEDLINGS.

Niagara Grape seedlings from the Rural Distribution; all white; absence of foxiness; valuable as a parent of new varieties.

AS the RURAL distributed among its readers a large quantity of seeds of this variety, it may be of some interest to know what may be expected to result from this distribution. I had planted some seeds of the Niagara before they were sent out by the RURAL. Some of the seedlings made rather weak and slender growth, with foliage of a wild and peculiar type somewhat resembling currant leaves and suggestive of the Rupestris species. None of them has shown indications of fruiting. The larger number of the seedlings, however, have the general character, both in growth and foliage, of the Niagara, and so far every one that has borne, has produced a white grape, showing that the variety has a very strong individuality which impresses itself upon its progeny. And although there are marked differences in the seedlings, both in shape of berries, flavor, and time of ripening, the most remarkable characteristic of all that have fruited here, has been an entire absence of either "foxy" taste or odor, which are so prominent in the Niagara. Whether this is due to some accidental cross-fertilization with another variety, or to a natural amelioration, it is impossible to say; but the result certainly promises improvement. The clusters of all—it being the third year from planting out, and the first year of bearing—were quite small. The earliest one bore a large, oval, lemon-yellow berry ripening last of August, three weeks before Niagara was equally mature. Others ripened in succession; the most of them with the Niagara about the same time. I have seen Niagara seedlings from two other sources this season; and these were also white. It now appears as though the Niagara may be valuable as the parent of new varieties of real value: as I have so far seen none that were inferior to it, while several seem to better in quality, and promising well as to growth and habit of vine. If seedlings generally prove as good as those I have seen, we have reason to expect some valuable improvement as the result of the Rural's distribution, and, I am free to confess, beyond any anticipations both when I planted seeds myself or when the seed were sent out from the RURAL Office.

Delaware, Ohio. GEO. W. CAMPBELL.

[We are glad to receive the above from Secretary Campbell. It will be remembered that the seedling of Niagara sent to us by Dr. Greenleaf was white, free from foxiness and of better quality than the Niagara.—EDS.]

BAGGING GRAPES. — In my experiments with ripening grapes, I find long-shaped bags convenient. Slit each corner of the mouth of the bag, and apply so the vine will occupy the slits: tie a string around the mouth of the bag above the vine. That will protect the stem and the cluster from frost, and the grapes will ripen to perfection. E. B. C.

Parma, Mich.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

PRUSSIAN AGRICULTURE.—Consul J. E. Potter sends to the State Department an account of the farming systems employed in the various German States. Not much can be learned by the American farmer of the German farmer except, perhaps, a lesson in the strict economy which the latter is obliged to practice. Families of seven are readily supported on farms of 10 acres in Germany. An instance is given where a 10-acre farmer made a better living than one who owned 20 acres adjoining him. The smaller farm supported one horse, two cows and seven pigs. The barn was so large that it seemed all out of

proportion to the farm. The manure pit was fitted with a water-tight foundation. The liquid manure was poured over the solids from time to time, and the hogs were allowed free access to the pile. This manure pit is fairly considered to guard the life of the farm. The owner of a first-class farm was questioned as to his business methods and profits. He had kept a complete set of books. The farm of 146 acres was divided into 104 acres of plowed ground, 18 acres of meadow, 15 acres of woodland and nine acres devoted to fruits and garden. The products were wheat, rye, oats, potatoes, sugar beets, hay and garden produce and fruit. His total crop was valued at $3,942.47. The family consisted of nine persons, five of them over 14 years of age. The cost of producing a bushel of various crops was—wheat, 84 cents; rye, 67 cents; oats, 20 cents, and potatoes 15 cents. The yearly cost of living for the family of nine persons was figured at about $714. Food cost $300; soap, fuel, beer, etc., $148; clothing, $119, and school expenses $145. Eggs, cheese, or other farm produce that could be readily sold, were rarely eaten, except on holidays. Coffee was considered to be very nutritious. The bill for sugar was but $2.85; for sirup $7.05, for tea $2.47, for coffee $14.16 and for salt $19.00. Adult farm hands were served five meals per day: two breakfasts; one at six and the other at 10; a dinner at 12, a first supper at four and another at seven. Meat and vegetables are given at dinner, and milk, potatoes, coffee and bread and butter at the other meals. Soups made of dried peas and beans, mixed with bacon, are largely eaten. Green beans preserved in salt, and cabbage are much esteemed. About 2½ pounds of bread and one-third of a pound of pork, besides vegetables, are considered a fair ration. Germany is as great a country for potatoes as is Ireland. Labor grades from $71.50 to $35 per year, with board. Large White hogs are very popular, and graded Shropshire sheep are well liked. On the farm mentioned 18 Holland cows were kept. Large cows are liked because they can be turned into beef when they fail in milk. Six oxen are fed for beef every year. About 120 head of sheep are also kept. The Holland cows are considered the best and most profitable milkers. They are kept for the entire year in the stable. They are always fat enough for market. The barns are kept at a nearly uniform temperature of 65°. The cows are never given very cold water. They are largely fed upon "returns of malt"—about like our malt sprouts—green food and grain. The ration for a cow weighing 1,100 pounds is reckoned at, Summer, 121 pounds of green clover; Fall, 110 pounds of sugar beets and 10 pounds of dry hay, and Winter, 82 pounds of sugar beets and 16 pounds clover hay. To this are added 11 pounds mixed bran and flaxseed meal. The expense of this ration is figured at 45 cents per day, which is just about covered by the milk. The other expenses of labor, rent, bedding, interest, etc., are figured at eight cents, and it is thought that the manure more than pays for this, leaving the carcass of beef for extra profit. A species of silage is prepared by leveling off strips of ground that shed water, near the barn, about four feet wide and as long as may be desired. All the green food, including stubble beets and some other roots, which at the close of the fall season have not been consumed, are deposited on this ground in thin layers, pressing each layer as compactly as possible, with the feet, or otherwise, until the long heap is from three to four feet high, tapering from the bottom to a point at the top. It is then covered with clean straw, and this with a layer of earth deep enough only to prevent freezing and to keep out the air as much as possible. Fermentation ceases very soon when the material is closely pressed and kept cool. These beds of silage are opened, when the food is wanted, at one end of the ridge, so as to expose only a small surface to the air.

PENCILS AND STOVE POLISH.—Catalogue and circular for Jos. Dixon Crucible Co., Jersey City, N. J.—The catalogue contains prices and descriptions of the celebrated "American Graphite" pencils and other articles of stationary made by this concern, which, as set forth in the catalogue, literally created a new American industry. Dixon's pencils are well known, and are said to have no superiors. They are used in the Government Departments at Washington, and by numerous schools, colleges and public institutions. The circular refers to Dixon's Stove Polish, and contains an alleged address on the subject by the renowned Brother Gardner at a meeting of the Lime Kiln Club. Dixon's stove polish has been in the market for 58 years, and having stood the test for all these years, the makers are warranted in their claim that it is the oldest, best, neatest and quickest. The only change in the polish is that instead of lowering the price or quality, they have doubled the size of the packages. Send for one of the circulars, which contains Bro. Gardner's speech and pictures of the members of the Lime Kiln Club.

P. J. BERCKMANS, Augusta, Ga.—A catalogue of fruit and ornamental trees. We find that grafted trees of the Japan Chestnut are offered at 50 cents each. Mr. B. says he has grown this tree for three years, and some of the trees "are bearing fruit." He says the burrs contain at times as many as five large nuts, and that the quality is similar to our native chestnuts. The catalogue also offers Simon's Plum; also Kelsey's, Botan and other new Japan plums.

BLOOMINGTON NURSERY, Bloomington, Ill.—A wholesale catalogue of trees, plants, shrubs, roses, bulbs, etc. Particular attention is called to their large stock and low prices of certain apples, cherries, pears, small fruits and ornamental trees.

H. S. ANDERSON, Union Springs, N. Y.—Circular of the new plum Shipper's Pride. This plum has many good qualities.

THOMAS G. ZANE.—Illustrated catalogue of strawberries and other fruits.

What Others Say

QUEER EXPERIMENTS.—Prof. A. E. Blount, of the Colorado Ag. College, has made some queer experiments according to several of the local journals. It seems that in one of his reports respecting the fattening of pigs, the aggregate weight of five pigs is given as 498 pounds. "The rumor has it," says a writer in the Live Stock Record, "that the pigs were guessed off; another that one was weighed and the others sized up with that one." The pigs were put in a pen and fed on corn alone and water for three months—84 days. During that time they gained 790 pounds, having consumed 1875 pounds of corn or 22.32 pounds a day. The gain of the pigs per day was 9.4 pounds. In answer to a criticism Prof. Blount replies that in his report "corn and water" should have read "corn and slops." But in this report he wrote "corn and water *alone*" as if to emphasize the fact that only corn had been fed. The pigs would have fattened on the slops alone and, as the Live Stock Record says, the experimenter who could innocently lose sight of such an important factor in his work is not one in whose experiments the public could place confidence; while if the omission to mention the slops was intentional, the offense becomes inexcusable. What Prof. Blount means by three months or 84 days is not explained.

Another journal—the Denver Tribune-Republican—alludes to his reports of experiments in cattle feeding as practically worthless as the age of the steers, details as to the hours of feeding, whether soiled or pastured, etc. are all omitted.

We have before now felt obliged to call attention to several matters which Prof. Blount should explain. One is that Blount's Prolific Corn, which, in reply to our inquiry, he informed us was the "result of science and cultivation," is really the Tennessee Prolific, and another is that several heads of wheats which he sent us as his "hybrids" were found to be old varieties.

SOAP FROM WOOL GREASE.—French chemists are said to have solved the problem of the utilization of the heretofore waste grease from scoured wools by using it to make soap. The fat having been heated to the melting point, absorbs certain compounds of sulphur, to the extent of retaining in a fixed state 100 times its volume of sulphureted hydrogen. When the fat is allowed to cool it is found to be soap. The combination of substances destroys the unpleasant odor of each, the mixture being fine and homogeneous. In the report of Consul Williams, at Rouen, giving these particulars, it is stated that manufactured soap of this kind has already become a commercial product in France. It is not toilet soap, but so cheap that it is likely to displace soaps based on soda for many important uses, "particularly in vine culture and horticulture as a defense against the insects that prey upon plants."

THE DIFFUSION PROCESS OF SUGAR-MAKING.—Last year the Department of Agriculture began to experiment in a small way at Ottawa, Kan., with the diffusion sugar-making process as applied to sorghum cane. Instead of crushing the cane as in the sugar-cane process, it was shaved off in minute slices and the sucrose, or sugar-yielding sap, extracted by streams of water. The results obtained were so encouraging that the field of operations was removed to Fort Scott this year, and with a largely increased plant, experiments are now in progress on a scale of some magnitude. Monday last a telegram was received from Professor Wiley, the Chemist of the Department, who is in charge of the works, announcing the complete success of the experiments. The telegram states that sirup has been obtained from the sorghum cane of light color, good flavor and crystallizing well. There was complete extraction of sucrose in six of the cells of the battery. In the process now used in the South there is a loss of nearly 50 per cent. of the saccharine matter contained in the cane, while the experiments at Fort Scott show an absolute extraction of all the sugar.

TIME TO WEAN COLTS.—As a rule colts are weaned too late in the season. They should have time to learn to eat heartily of other foods before cold weather, says the National Stockman. A colt foaled in May should be weaned in September, which will allow both it and its dam to go into winter-quarters in better shape than if weaning is postponed until October or November. If the mare is kept breeding, and has not anything else to do but to breed and nurse her colts, she will get along if the colt is not weaned until December; but the colt will not do so well if put upon fodder and hay all of a sudden at that time of year. The young thing should be taught to eat before it is weaned.

BUY BRAN EARLY.—The time bran can be bought cheapest is at the opening of the market for new crop wheat, as millers at that time are anxious to economize room. Bran is bulky in proportion to its weight, and for this reason many farmers have not the proper room to store it. But the thoughtful feeder will supply the necessary storage room and buy early, so as to save a considerable sum in buying ton, five-ton or car-load lots.

CATTLE IN BRAZIL.—Referring to the cattle of Brazil, the Live-Stock Journal, London, says that Rio Grande do Sul is one of the most southern provinces of Brazil. The country is wholly agricultural, and the principal product engrossing attention is cattle. This industry is assuming large dimensions, as about 800,000 head are slaughtered yearly for export. It is estimated that there are about 9,000,000 head of cattle in the province, and the practice is to slaughter oxen at about four years old, and cows at 14 or 15 years. The Brazilians in Rio Grande have little idea of early maturity, though they study economy of production. In fact, the owners pay little or no attention to their herds, and the cattle have to forage for their food. Cattle-breeding, as understood in England, is unknown, and vast herds wander about at their own sweet will, unattended, unprotected, and positively uncared for.

WHAT AN EGG WILL DO.—For burns and scalds nothing is more soothing than the white of an egg, which may be poured over the wound. It is softer as a varnish for a burn than collodion, and being always at hand can be applied. It is also more cooling than the sweet oil and cotton which was formerly supposed to be the surest application to allay smarting pain. It is the contact with the air which gives the extreme discomfort experienced from the ordinary accident of this kind, and anything that excludes the air and prevents inflammation is the thing to be at once applied. The egg is considered one of the best of remedies for dysentery. Beaten up slightly, with or without sugar, and swallowed at a gulp, it tends, by its emollient qualities, to lessen the inflammation of the stomach and intestines, and by forming a transient coating on these organs, to enable nature to resume her healthful sway over a diseased body. Two, or at most three eggs per day would be all that is required in ordinary cases; and since egg is not merely medicine, but food as well, the lighter the diet otherwise and the quieter the patient is kept, the more certain and rapid the recovery.

WORTH NOTING.

WILLIAM FALCONER, having tried many kinds of muskmelons on the sandy soil of his island home, thinks that the Huckensack, all things considered, is the very best.

WALDO F. BROWN says, in the Weekly Press, that the heaviest yield of wheat ever grown in Ohio—over 60 bushels to the acre on a 10-acre field—was grown where a crop of clover was burned off because it was too heavy to be turned under.

WHEN Sir J. B. Lawes, comments the above Journal, is not willing to report on an experiment because it has been running only 27 years, it is time for Americans to wait at least one season before condemning or extolling a breed, a fruit or a method in farm practice.

THE Orchard and Garden says the trailing habit of the Lucretia Dewberry is of no advantage in the climate of New Jersey, but proves to be so in all localities with a climate too severe for the upright blackberry varieties. The fruit is very large, luscious and produced in great abundance. But the grower should apply a light mulch around the plants, if he wishes to keep the berries from getting soiled and gritty.

FOR early celery it is now time to "bank up." The later celery should be "handled," that is, the stems should be supported by the soil and so strengthened. Instead of banking up, we are trying the simple experiment of placing and supporting a board on either side.

SOW spinach now.

DR. BECKWITH, of the N. Y. Ex. Station, finds the Alaska Pea no better or earlier than several other first-earlies planted near it.

SOME people feed carp as they do chickens. A writer in the Farm and Fireside says that when he wishes to see the fish or let a neighbor see them he gives them sheaf oats. When he wishes merely to feed them he gives them thrashed oats or shelled corn. Anything that a porker will eat is food for carp.

THE Mass. Ag. College is certainly worthy of the support of every farmer, as Our Country Home tells us. Pres. Godell is a good and efficient man; Major Alvord, the Professor of Agriculture, is as good a man as we know of. He is good and true. Prof. Fernald, Professor of Entomology and History, comes from the Maine Ag. College where he was much respected. Prof. Goessmann is one of our best chemists. The college is well equipped. Apply to Pres. H. H. Godell (Amherst, Mass.) for any needed information.

AN ingenious name, a druggest informs us, has been given to a proprietary anthelmintic, viz., the Early Bird.

HERE are two conundrums propounded and answered by a friend:

1st. A man met three beggars. To one he gave 10 cents, to the second five cents, to the third man 10 cents. What time was it?

Ans.—A quarter to three.

2nd. Mr. Andrew Little had a beautiful daughter. She fell in love with his coachman. When Mr. Little discovered it he was very angry and pursued the coachman. What time was it?

Ans.—A little after one.

KILL off the old hens and the young roosters.

A THOROUGH kerosening of the hen houses now will pay. It will cost less and be more effective in killing lice than a coat of whitewash.

AS soon as the leaves change color is a good time to transplant.

IT is gratifying to see how widespread the practice is becoming of sowing rye for early feeding in the Spring, says the New England Farmer. In the West the best dairy farmers sow fields of it every year.

D. H. THING says that there is a farmer's daughter in his school district who has mowed all her father's grass the past season, raked the hay, kept school to the satisfaction of the district, plays the piano skilfully and makes as nice biscuit as any of the mothers.

THE new tree Cercidiphyllum Japonicum loses its leaves early at the Rural Grounds. We doubt if it will ever prove a great success as an ornamental tree.

TRY Kelsey's Japan Plum.

MR. P. J. BERCKMANS says that the Japan plums are as distinct from our native varieties as is the LeConte Pear from the Bartlett. The trees resemble somewhat our vigorous varieties of the Chickasaw type, but the foliage is larger and quite distinct. They are hardy as far North as where the Wild Goose succeeds, and for our Southern States they open a new era in plum culture.

IN the late report of the Ohio State Horticultural Society, A. S. Cutter asks if forestry means anything to us personally? Yes, very much, is the reply. If any farmer has within his premises an acre or two, or a half dozen acres of land poorer than the rest, that land will recuperate under timber cultivation as it will with no other available treatment. Land that is growing trees loses no strength, but continually gains in all the essential elements of the soil, and these few poorest acres will become to his children double the value, acre for acre, of all his farm besides.

DR. HOLMES says that men remind him of pears in their way of coming to maturity. Some are ripe at 20, like human Jargonelles, and must be made the most of for their day is soon over. Some come into their perfect condition late, like the autumn kinds, and they last better than the summer fruit. And some that, like Winter Nelis, have been hard and uninviting until all the rest have had their season, get their glow and perfume long after the frost and snow have done their worst with the orchards. Beware of rash criticisms; the rough and astringent fruit you condemn may be an autumn or a winter pear, and that which you picked up beneath the same bough in Au-

gust may have been only its worm-eaten windfall .....

In the race of life it doesn't take very long for poverty to overtake laziness.....

Everybody says that good times are coming, and, as times are controlled for good or for bad, very largely by what everybody says, everybody is glad to hear everybody say this.

Prof. Cook, Director of the New Jersey Experiment Station, states in his report that he tries experiments over and over again before he says anything about them. He says of potash that it must be soluble before it is available. He would like to say that sulphate is better than muriate, but as yet he has not said it, but does say that he sees no difference. After experimenting twelve years, he sees no reason why any one should pay seven cents a pound for potash in the sulphate when he can get it for three cents a pound in the muriate..

Speaking of the vitality of seeds from commission men, W. S. Devol, of the Ohio Agricultural Experiment Station, says he has not observed a single instance where a variety from commissioned grocers gave so large a per cent. of germinated seeds as did the same variety put up by the same firm and procured direct from the firm..... .....

Public watering places are excellent places for spreading diseases among horses. Avoid them if there are any dangerous or contagious diseases raging in your neighborhood.....

This Winter will be doubly severe on your young horses unless you have them in first-class condition when they go into winter-quarters. Good care from now on will be well repaid before Spring.....

Dr. Gadsden, like nearly all other American veterinarians and most of those of Europe, insists that the only safe course is to slaughter every animal that has ever had pleuro-pneumonia, as he believes the disease to be incurable, and considers the so-called recovered cases the most dangerous.....

The penalty for abusing horses is generally paid by those who do it, yet frequently they are unaware of the fact.....

Everywhere.

RURAL SPECIAL REPORTS.

Canada.

Dominionville, Ontario, Sept. 28.—Crops in this section are good. Wheat, oats and peas are better than an average. Corn not much grown. Hay hardly an average. Potatoes rotting badly—not an average crop.

H. A. M.

Roxton Falls, P. Q.—Wheat, barley, oats, buckwheat and peas are good and harvested in good order. Hay better than expected. Corn shortened by drought. Potatoes yielded well, but rotted badly in some places.

J. F. L.

Delaware.

Dover, Kent Co., Sept 29.—We are now having some very warm weather—the hottest of the season; thermometer ranging from 75 to 90 in the shade. Wheat was badly damaged by the rain before it was thrashed. What has been sold brought from 60 to 80 cents. Corn is nearly all in the shock, or else topped; many fields that had a growth large enough for 50 to 60 bushels per acre will not produce more than 30 to 40 in consequence of so many barren stalks, which we attribute to the fact that when the silks and tassels were in condition to fertilize we had two or three days of hard rain which probably destroyed the pollen. The seeding of wheat is now the order of the day. We commenced last Saturday; but the greater portion will not be sown until next week. It is now too hot. We are afraid of the fly.

S. T. S.

Illinois.

Chicago, Cook Co., October 5.—For a week the whole Northwest has enjoyed extremely bright weather, and every department of farm work has moved along uninterruptedly. There are no areas at present needing rain where the pastures were not seriously damaged by the terrible drought of July and August. The favorable conditions also have enabled us to complete the Fall seeding of winter wheat in all areas north of the Ohio River. Of course the acreage question is one of great interest, and in nearly every State in the winter wheat belt the acreage promises to be fully as large as in 1885. I think that the low prices of everything which farmers have to consume and have in a great measure reconciled our farmers to the prevailing prices of wheat. The movement of winter wheat for the last 30 days, owing to the fact that farmers have been so busy seeding, is only nominal. At the same time there does not seem to be any feeling among the producers that higher prices will prevail, for the present at least. The movement in the spring wheat belt continues very free, and there are no signs at present that it will be materially reduced for the next 30 to 60 days. Reports with regard to yield in Minnesota and Dakota are still just as conflicting as ever

The first killing frosts of the season put in their appearance October 1st and 2d. The corn crop in the meantime had everywhere matured. So far we have had very little drying weather to put corn in condition for cribbing. A great deal of corn has been cut up in the different States for feed, and so far no reports have been received which would indicate that the crop was any better than has been reported during the last 60 days. Nobody pretends to say that corn is particularly scarce. At the same time if the statements are true which have been so generally made that there is a deficiency of 350,000 bushels in the yield, this shortage must be felt very perceptibly before another crop is made. The receipts of old corn out of farmers' hands, and also what is known as the cribbed corn along the railroads, have been very materially reduced during the last 30 days.

The hog situation is a question which will interest us very particularly from the present time until the winter packing season is well advanced. I notice that the Government has lately reported considerable disease called hog cholera. "Hog cholera" is a very wide form of expression; and it takes in every ill that hogs are heir to. It has baffled so far the skill of science to determine what it is, or to point out a remedy for the disease. It comes when we expect it the least, and does not leave us as long as it has any material to work upon. That we have had this disease this Fall is a fact, but so far, from my investigation I do not think it has been anything like as fatal as it was during the Fall and Winter of 1885 and 1884. I think there is a fair supply of hogs still in the country, and that the fall and early winter run may probably fall a little below that of the preceding season. Hogs are not held for particular seasons, as in former years, but are now marketed all the year round whenever they are fit to go.

C. M.

Kansas.

Frankfort, Marshall Co., Sept. 30.—We have had some showers this month, and cooler weather of late, but it is yet too dry for plowing. Crops are not an average in this vicinity. Corn something more than half a crop. Early potatoes pretty good, but late ones almost nothing. Pastures have been short. Clover and Timothy are growing nicely, but not enough for half pasturage, and hay is needed.

A. N. Y.

Kentucky.

Louisville, Jefferson Co., Oct. 3.—Dispatches to this place report frosts all over the State. About half of the tobacco crop is uncut, and so much has been injured that one-half to three-quarters of it will make only frosted lugs. Tobacco in lowlands is much damaged, while that on the uplands is little hurt. An experienced broker and handler thinks Friday night's frost will much impair the quality, but not reduce the quantity of the crop. Reports from the Flat Lick section, noted for dark, rich tobacco, are bad.

M. L. H.

Massachusetts.

Sandwich, Barnstable Co., Oct. 4.—The inland cranberry bogs suffered more on Saturday and last night by frost than at any time this season. At nine o'clock last night the thermometer registered 30 degrees, gradually falling until midnight. It was the coldest night this season. In the little village of Mashpee the frost did heavy damage. The largest grower there is the Mashpee Manufacturing Company, which loses one-half of its crop—about 600 barrels. Oliver M. Holmes, another large grower there, lost 400 barrels. There are many smaller bogs there and in the immediate neighborhood, including those which cannot be flowed. These are nearly total wrecks. Many of the berries were only nipped, which necessarily reduces the price.

R. H.

Wyoming Territory.

West Ferndale, Whatcom Co., Sept. 28.—All crops here are above the average on a largely increased acreage. Prices are: wheat, $1.50 per cental, or 100 pounds; oats, $1.25; peas, $1.50; barley, $1.50; hay, $6 per ton, eggs 25 cents per dozen, dressed meats six cents per pound, potatoes 40 cents per bushel. Mrs. Fisher's articles were very good, and we hoped she would visit the Nooksack Valley. She would have found a great deal more agricultural land than on the White River, and not half as hard to clear. The photo. of her was an agreeable surprise. She saw things about as they are, except the Chinese question. She certainly did not see the moral side of that, or she would have written differently about the Mongolians.

Z. H. R

Virginia.

Richmond, Henrico Co., Oct. 2.—Our market this week for leaf tobacco has been a quiet one, and little else but low grades of lugs and nondescript leaf seemed to find ready buyers, and these sold at very low prices, ruling at 2¾ to 3½ cents. This morning a heavy and damaging frost is reported from all parts of this and adjoining States of North Carolina and West Virginia. From one-third to one-half of the crop was uncut, and it appears that little of this escaped the frost, which blackened it in many sections. Of course, much will have been cut green to-day, with still very threatening weather. The late tobacco was chiefly depended on for the best of the crop, and the weather till yesterday was fine on the plants in the field. Potato vines were blackened in and near town. The market, no doubt, will be firmer and higher, and some have withdrawn good stocks from sale already. There must be few wrappers or good fillers made at any rate. Our tobacco year ended September 30, 1886. Total stocks on hand are as follows, with comparisons of previous years:

	Inspected.		Uninspected.		Total.	
	Hhds.	Tcs.	Hhds.	Tcs.	Hhds.	Tcs.
1886.....	18,744	1,329	6,608	307	25,372	1,736
1885.....	13,547	1,098	4,990	75	18,537	1,173
1884.....	7,873	147	1,689	22	9,567	429

The annual report of the president of the Danville Tobacco Association shows that the sales for the year were 40,353,942 pounds at an average of $9.41 per 100.

THE FARMERS' CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

COW-POX IN COWS.

W. H. P., Grover, Pa.—The teats of some of our cows have become completely covered with scabs which come off when one tries to milk the animals. It is cow-pox I suppose. Is it contagious, and what should be the treatment?

Ans.—There are many forms of eruption on the teats and udder of a cow, which are sometimes confounded with those of variola or cow pox; but the eruptions of genuine cow-pox have certain characteristics which distinguish them from those produced by what are called spurious forms of the disease. The local symptoms of true cow-pox are heat, swelling and tenderness of the teats for three or four days, followed by irregular, pimply hardness of the skin, particularly about the base of the teats. The pimples can generally be felt in from five to ten days after communication. They become red when about the size of a pea, are very painful and hard, gradually increasing in size, and in three or four days they attain the size of a horse bean; and are circular in form on the udder and oblong on the teats. They rise in the center, becoming more or less pointed, and contain at first a clear and, later, an opaque fluid. If the vesicles are broken, troublesome sores occur, the discharge from which will communicate the disease to the milker, if not protected by previous vaccination. If not broken the vesicles become depressed in the center and around the base is a very red and tender halo or circle. The size is greatest about the tenth day, when it is a pustule—having an inflamed base and containing pus. The pustule dries up, and dark brown or black solid scabs or crusts form on the surface. Vesicles, pustules and scabs may sometimes be seen on the same teat at one time. The scabs if left undisturbed, gradually become thicker and darker until about the fourteenth day, and fall off spontaneously at about the end of three weeks, leaving shallow, smooth, oval or circular pits of a pale rose color. In tropical climates the disease is generally very severe, often causing death; but in temperate regions it is generally mild, usually causing only a slight diminution in the milk yield and a little loss of appetite. Sometimes, however, the mouth becomes sore, driveling of saliva takes place, the cheeks are pushed outward and inward by a partial breathing through the mouth, there are some abdominal pains and diarrhea; but these symptoms are almost entirely confined to the hot sections of the country. The disease is contagious and when once it appears in a herd it will usually pass through it, unless special care is taken to isolate completely all infected animals. A stable is often infected by it so that every cow brought into it will take the disease. Beyond making the udder and teats very sore, the disease is not harmful; and in ordinary cases non-interference is the best course, as it will come to an end naturally in about three weeks. Sometimes, however, treatment may be advisable. The course of the disease is hastened and ameliorated by giving daily doses of one ounce of hyposulphite of soda for a week or ten days, and continuing smaller doses of one dram daily as long as the pustules remain. Care should be taken not to break these, so as to avoid painful sores and a good deal of inflammation. The soreness is relieved by painting them over with camphorated soap liniment mixed with an equal quantity of ether. The milking should be done with milking tubes, when there is any danger of breaking the vesicles, pustules or scabs. The person who milks the diseased cows should milk no others or the infection will be conveyed in that way. Indeed, those who attend the infected cows should not go near the others. The feed should be laxative and cooling—bran mash or beets and carrots are advisable; but no corn meal or cotton-seed meal should be used.

CUTTING BACK RASPBERRY AND BLACKBERRY CANES.

J. A. Mc E., Canton, Mo.—Will the cutting back of raspberry and blackberry canes in October injure their fruiting next year? If a cane of either berry, not having been pinched back, has been allowed to grow five feet in length, and is now cut back to two or three feet, will it bear a full crop next season?

Ans.—We should prefer to leave the new canes as they are in order to secure the best yield. The cutting back of the canes of the current year's growth had better be done early, when they have reached the desired hight. Later the laterals should be pinched off or cut back. The object is to secure all the bearing wood possible to each cane. Cutting, or pinching back in early September will hasten maturity. But by cutting them back now, nothing would be gained. If the old canes have not yet been removed, it would be better to wait until the Spring and then make one job of it, viz., cut out the old canes and cut back the new ones.

Miscellaneous.

F. S. W., Des Moines, Ia.—1. What is the difference between Optimus and Livingston's Favorite Tomatoes? 2. What between Pearl of Savoy and Beauty of Hebron Potato?

Ans.—1. The Optimus is a better keeper—less liable to rot. 2. We have before stated they are very nearly alike; but we are not prepared to say that they are the same.

H. G., Hamburg, Conn.—Is kainit a good dressing for peach and plum trees; and if so, when should it be applied?

Ans.—We don't quite understand the question as to planting "potato onion sets in the Fall." Please repeat. Yes, it is a proper dressing for any kind of fruit trees if the soil needs potash. Better add raw bone.

W. W. O., Muncie, Ind.—The flower sent for name is Tagetes tenuifolia, a Mexican marigold.

DISCUSSION.

C. H., Columbus, Ohio.—In a late Rural, the Burpee's Turner, Henderson's Mikado and Livingston's Potato-leaf Tomatoes are all said to be the same. I exhibited the Potato-leaf at the Ohio State Fair, and others exhibited the Mikado and Turner; and of the Potato-leaf 95 per cent. were perfect tomatoes, while of the other two not a perfect tomato was shown. My only interest in the matter is a desire to see justice done to Mr. Livingston.

R. N.-Y.—We know nothing of Livingston's Potato-leaf Tomato, except that he sent us several plants in order to ascertain what they were. We found them to be the Mikado or Turner's Hybrid, though the Tomatoes average smoother as if a better or longer selection had been made.

Miscellaneous Advertising.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your grocer for Dixon's big cake.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
KLBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, OCTOBER 16, 1886.

WE tell the reader about all that is known of the half peach, half plum, Prunus Simonii, on page 689. It seems to us an acquisition, and it is probable that its seedlings may give us valuable fruit, intermediate between the plum and peach.

Two or three years ago, the writer grafted one of his seedling grape-vines upon a Concord. The seedling was of sturdy growth, but not remarkably so. This year upon the Concord the main cane has grown 25 feet—the longest growth we have ever observed at the Rural Grounds.

WE have a final word to say of Clapp's Favorite Pear, as it is produced at the Rural Grounds. The trees bear a greater *weight* of fruit than any we have ever raised, and they bear every year. The tree is very vigorous, fast-growing and bears young. The pears are uniformly large and showy, ripening a full week before the Bartlett. The flesh is white and quite juicy. That is all we can say for its quality. They are rather sweet, the sweetness of a little sugar and a good deal of water, without spiciness or sprightliness. The books describe this pear as "juicy, melting, buttery, rich, vinous, perfumed, sweet."

NOTICE.

THE Thanksgiving Number of the RURAL NEW-YORKER will be dated November 20th. It will present a full account of the RURAL's next Seed Distribution, and we shall issue 24 pages. Advertising rates will be the same as usual for the regular paper (30 cents per line) and 50 cents per line for the Supplement, which will be sent out from its date until next June.

WE have several times spoken of the Mikado Pear, to praise it as an ornamental tree; to praise it for the beauty of its round, golden pears which hang like so many balls suspended by slender stems two inches or more in length; to praise its wonderful productiveness, rapid growth, its early bearing; to condemn the *quality* of the fruit, no matter how carefully or in what way it is ripened. But we have now to add that when canned it is as delicious as any pear we have ever eaten. It is a question for each one to decide whether this tree is or is not worth cultivating for its beauty as an ornamental tree and for the value of its fruit, so bountifully produced, when canned. The Mikado is a Japan pear, hardier than the Kieffer and earlier by two weeks to ripen.

AT a recent school meeting in a Western State a bluff old man, who had grown tired of paying taxes to support experiments in education, said: "We don't want any more apparatus here—what we do want is more of the living stuff in our schools." Living stuff! He might have used a more elegant phrase, but hardly one that would have put the truth more to the point. We do need "living stuff" in our schools. We need originality, energy and common sense. We never will have it till we hunt it out and pay for it. If we try to economize on the teacher's wages, or hire some "poor stick" of a teacher just because he is cheap, we take the first step towards laying in a cargo of "dead stuff" that will not pay its passage. Our schools need looking after and overhauling. Put "living stuff" into them by all means.

A FRIEND had a lot of choice young heifers to carry through the Summer. The pasture fairly swarmed with bloodthirsty flies that rendered life for cattle almost intolerable. The heifers were fitted with jackets made out of light cotton cloth like the ordinary horse blanket, only arranged so as to button underneath the animal. With this covering only the head, neck and legs were exposed to the flies. This cover cost but little and made hardly any extra work. While cattle in the neighboring fields were driven almost crazy by flies, these little things enjoyed comparative comfort. The flies could only attack a part of the body where they could be reached and driven away. Nor was the increased comfort of this young stock the only point to be considered. We believe the heifers were in far better condition at the end of the season to pay for this protection. There is a good lesson here that stockmen will do well to heed.

THE POOR MAN'S FRIEND!

BEFORE Congress the oleomargarine people claimed that from 50 to 60 per cent. of their product consisted of pure butter. The other day samples of the stuff were seized by the Dairy and Food Commissioners in Cincinnati and analyzed by Henry A. Weber, Professor of Agricultural Chemistry in the Ohio State University at Columbus, and according to the sworn statement of the Professor, the highest percentage of pure butter found in any of the samples was 20 per cent., and the lowest six per cent., "the balance of the adulteration—94 per cent.—consisting of lard, tallow, salt and coloring matter." Taking the average of the 12 samples, "they contained just 10½ per cent. of pure butter and 89½ per cent. of adulterations." This stuff was purchased at the rate of 20 to 23 cents per pound from parties who claim to keep first-class groceries. The retailer pays from 11 to 12½ cents per pound for it, and it costs the manufacturer from seven to eight cents per pound. Last year 150,000,000 pounds of oleo were turned out in the United States, costing, at an average of seven cents per pound, $10,000,000, and selling for $37,000,000. Take the whole country through and the average price at which oleo is retailed is not less than 25 cents per pound. Every handler of the stuff claims, however, to be the "poor man's friend," yet what cost seven cents per pound is sold to the "poor man" for 25 cents!

MAKE WINTER WORK.

CAN'T you make work for the hired man this Winter? Try it. Can't you make arrangements for feeding stock or cutting wood that will enable you to give the hired man a home, at least? The cities are filled every Winter with farm hands who have no place to stay after November. Many of them would come here anyway, but there are some who would stay at the farm if they knew they could have a good home. These are the men you should help. Many a young man can be made into a useful citizen by a little encouragement, such as you can easily give. You have a home, with plenty to eat and drink and enough to wear. If you have a promising young man at work for you, don't let him go tramping off to the city this Winter—if a few words from you will keep him away. Exert yourself, make a little extra work for the sake of giving him a job. We make no plea for the many foul-tongued rascals who are found on too many farms. Get rid of them by all means. They are worse than poison in your family. But if you have a man who is capable of appreciating a home, and who has good in him, keep him if you can. You have a chance to carry out a little practical benevolence that you will never regret.

HEAVY CHARGES.

Last March we told how the great trunk railroad lines east from Chicago had put up the rates on shipments of dressed meat, much to the disgust of the packers, who roundly declared that the trade would be utterly ruined by the rise. It appears that between March 1 and September 1, this year, 176,677 tons of live cattle and 138,181 tons of dressed beef were shipped east from the Lake City. The increase in rates on March 1 was from 25 to 35 cents per 100 pounds on live cattle and from 43½ to 65 cents per 100 pounds on dressed beef. In spite of the payment of this great increase in transportation charges, the live cattle trade has not fallen off, while the dressed meat trade has largely increased and those engaged in it have made enormous profits. The railroad pool which controls the charges, and among whose members the profits are divided, have also made heavy gains. The pool allows from 17½ to 20 cents per 100 pounds for service in transportation of live cattle from Chicago to the seaboard. At 20 cents per 100 pounds, the cost of carrying 176,677 tons would be $706,708; while the shippers, at 35 cents per 100 pounds, paid a grand total of $1,236,739, giving a clear profit of $530,031. The pool allows 27½ cents per 100 pounds for service in carrying dressed beef, amounting, on 138,181 tons, to $759,995; at 65 cents per 100 pounds, the shippers paid $1,796,357, giving a clear profit of $1,036,358, or an aggregate profit of $1,566,389 in six months, to be divided between the members of the pool. All this, together with the great profits of the shippers, has had, of course, to come out of the pockets of producers and consumers.

PLEURO IN CHICAGO.

The cattle affected with contagious pleuro-pneumonia in Chicago and those exposed to infection are still quarantined under the direction of the National Bureau of Animal Industry. None of the animals have been yet officially killed for want of funds to pay for the slaughtered animals, and because no decision has yet been reached as to the disposal of the carcasses. Last Sunday 160 of the quarantined animals are reported to have been "spirited away;" a number of others, the telegraph says, have since disappeared; the milk of most of the cows is sold secretly and openly in the neighborhood of the distilleries, and, according to all reports, the quarantine is maintained in a very inefficient manner. It is probable that the vanished beasts have been slaughtered for sale, though there is some fear that some of them have been shipped out of the city. The Board of Health of New York is closely inspecting all dressed beef from Chicago to prevent the sale of any diseased carcasses. A telegram from Baltimore this morning tells of similar precautions there, and doubtless other places where Chicago dressed beef is largely sold will be equally prudent. Investigation has proved that the reports of pleuro-pneumonia said to have been carried from Chicago to several other parts of the country were unfounded. Texas fever or some other diseases were mistaken for the plague. The dilatory action on the part of the Illinois authorities is short-sighted and blameworthy in view of the importance of prompt and vigorous action.

FORTUNES IN THE CLOUDS.

WITHIN the past week lengthy advertisements concerning enormous fortunes lying unclaimed in England, Holland and Germany have appeared in a great number of papers—some of them among the best in the country. Indeed a good deal of judgment appears to have been exercised in selecting journals of wide circulation and high reputation for integrity as the means by which a very alluring bait has been placed before the public. The weekly editions circulated chiefly among the agricultural community, seem to be especially selected by the advertisers. A large alphabetical list of names is given of people who are alleged to have left fortunes for which no valid claims have hitherto been made, and which will be readily surrendered to the rightful heirs, who are very likely to be among the thousands who bear the same names as those in the list given or in the far larger one which is promised for 50 cents. For this sum a list of surnames only is given with the number of unclaimed fortunes left by different people of the same name—Brown, 98; Lyons, 3; Smith, 264—and a heavier fee is then demanded for the given names of the defunct. For still larger fees more information will be doled out, and the gullible and greedy will be temptingly supplied with alluring hopes so long as they are able and willing to make disbursements.

The assurance that there are large fortunes awaiting claimants in the English Court of Chancery, the Bank of England and other foreign depositories is utterly devoid of truth, and the accounts published every little while that some Brown, Jones or Smith has received a vast estate by tracing his pedigree to the defunct owner of millions thus held in trust, are entirely fictitious. The alleged extracts from foreign newspapers announcing the existence of such deposits are, in nine cases out of ten, either sheer fabrications or extracts from advertisements palmed off on the public as editorial statements.

For years a number of swindling claim agents have made a precarious living in London by extorting money from the credulous on pretense of being able to secure for them enormous sums awaiting rightful heirs yet undiscovered. A frequent advertisement of such a fraud in the London Times is always introduced by the assertion that "to-day" an English laborer receives from the Court of Chancery £250,000. Minister Phelps, however, says there isn't a particle of truth in such stories, and readers of London newspapers know that every few days these rascally schemers are dragged before the magistrates for swindling some "claimant" under pretense of proving his title to a fortune. Further information with regard to these alleged bonanzas is given in this issue, in the department devoted to the exposure of frauds.

We earnestly urge our contemporaries in all parts of the country to disabuse the minds of the ignorant and gullible of the mistaken idea that a single dollar can ever be obtained by them through the allurements of this widely circulated advertisement. Nobody will ever recover a cent except the claim agents, and every cent paid to them will be a dead loss. The advertisement was offered to the RURAL NEW-YORKER last Tuesday, but knowing that statements it contained were false, it was, of course, at once refused. Most of the papers that have admitted it, would, no doubt, have done what we did, had they, like ourselves, been for years constantly watchful to detect, reject and expose all schemes for duping the public. The least reparation they can make to their readers, however, is to warn them that the alluring fortunes spoken of in the advertisement have an existence only in the clouds, the moon, the covetous fancy of a simpleton, or the scheming brain of a swindler.

BREVITIES.

RED-TOP Grass seed for the lawn.

EMMONS POND hits the nail pretty squarely. See page 670. "Push Ahead."

PRES. WILDER writes us that he thinks the Eumelan Grape is not deservedly appreciated.

SECRETARY CAMPBELL favors us with a very interesting article on seedlings of the Niagara. See page 689.

From the continued crossing of rye upon our rye-wheat hybrids we have now several plants which are by parentage seven-eighths rye.

THE leaves of our common catalpa were wilted and discolored like those of a canna by the frost of last week, while those of the Catalpa speciosa are as green as ever.

MR. FALCONER, on page 608, pertinently remarks: "Talking of landscape gardening in a city lot of a few rods or the farmer's ordinary garden patch, seems like so much twaddle."

SEVERAL years ago in our Seed Distribution, we sent to applicants the Thousand-fold Rye. It yields splendidly at the Rural Farm, and we should like to hear how it behaves with others.

D. S. MARVIN writes us that the cause of the doubling of the flowers of gladioli must be in the air this season. The same thing which the RURAL mentioned has occurred with some of his flowers.

LOOK over the RURAL's black list of Congressmen who voted against the "oleo" bill. If you find one of them running for an office within your reach, throw your ballot under his feet and trip him up.

It has long been the opinion of the writer that certain diseases may be communicated to both children and adults, but especially the former, through milk. For this reason all the milk drank by the family is boiled.

BY selecting for seed those pods of Limas which have the most beans, the average number is increased certainly. For several years we have saved only those that contained five; but it is found that the beans (seeds) are smaller and that thus far nothing has been gained. What is gained in number is lost in weight. The strain known as King of the Garden, is thus far, the best Lima we have raised.

O. H. ALEXANDER, of Charlotte, Vermont, referring to the R. N.-Y.'s remarks regarding Macomber's white seedling of the Antwerp Raspberry, says that he has tested it for three years by the side of Cuthbert, and finds it just as hardy. He prefers it to any other. "The flavor," he says, "is all that one could desire." So it is, and we hope it may prove as hardy in other places where there is less snow than in Vermont. Mr. A. calls it "White Mountain."

THE English papers all contain reports of the "root market." Prices are given for mangels, beets and turnips as regularly as our papers give them for hay and straw. The annual root crop of England is immense, and the feeding value of this crop adds greatly to the value of England's agricultural wealth. In some sections of our own country, the root crop is an important item, but in others it seems to add little to farm forage. In a cool, moist situation, roots will be profitable. It is idle to advocate the growing of roots extensively all over the country. In some sections other animal foods can be more cheaply produced.

THE State Grange of South Carolina appeals to other State Granges, the National Grange and all farmers throughout the country to send aid to a large number of farmers in the lower section of the State who have been made destitute by the earthquakes. Hundreds of farmers have had their houses destroyed and are unable to build them without financial aid. They live in out-of-the-way places, and it takes time for reports of their condition to reach the towns and the world at large. Now that the Mayor of Charleston has announced that no further aid is needed in that city, why shouldn't the contributions which are still flowing in be turned over to the relief of the suffering farmers?

A PROVISION of the Pennsylvania constitution forbids a common carrier to engage in any other business. A number of the railroads of the State have also engaged in coal mining, and have lately combined to restrict the production of coal, a necessary of life, as well as to control its sale and extortionately advance its price. Governor Pattison has just very properly denounced the combination as "constantly, violently and flagrantly" violating the constitution, and he calls on the Attorney-General to enforce the law. Is there any check on powerful corporate monopolies?

Miscellaneous.

LAW.

RAILROAD FENCES.

As a rule, railroad companies are obliged to fence their tracks, and are responsible for all injuries to stock, whether by negligence or not, in case they have not done so. In one case some sheep got through a railroad fence and were killed on the track. The company pleaded that the fence was good enough for ordinary purposes; but that the keeping of sheep in that field had not been contemplated. The Court ruled in favor of the plaintiff. In Maine legal and sufficient fences must be made on each side of the road passing through inclosed or improved land or wood-lots belonging to a farm, and the companies are liable to a penalty for failing to make and repair them. In New Hampshire, if the roads neglect to maintain such fences, the owner of the land can build them and recover double the cost from the company. In Vermont the roads are obliged to maintain fences, where necessary, and in case of failure to do so, are liable for damages caused by absence of fences, except where the landowner has been paid for fencing the road, and has agreed to maintain the fences. In Massachusetts the companies are obliged to fence the entire length of the roads except at the crossings of highways, etc. In Connecticut every company is required to build and maintain fences on both sides of the road, except where the railroad commissioners may decide they are inexpedient or unnecessary. If the companies have agreed with the owners of adjoining lands to make and maintain such fences, and the latter fail to do so within 60 days after notification, the roads may build the fences and recover the cost in an action for debt. Where there are no laws, and no obligation is imposed by covenant or prescription, the common-law doctrine is in force, and the company is no more bound to fence its land than is the individual. At common law, owners of adjoining lands owe each other no duties, and are subject to no obligations to maintain fences. As owners of land, railroad companies are subject only to the same liabilities as other owners.

Railroad men frequently complain that farmers along the lines often have a strong inclination to find surreptitiously a profitable market for poor stock on the railroad tracks. The late Col. Thomas A. Scott, the great Pennsylvania railroad king, used to say that to enhance the value of scrub stock no cross was more effective than a cross by a railroad engine.

Here are some recent decisions of interest to farmers:

HOMESTEAD EXEMPTION.—In Kentucky, according to the decision of the Court of Appeals of that State, in the case of Roberts *vs.* Riggs *et al.*, the release or waiver of the homestead exemption, in order to be valid as against a mechanic's lien for additional improvements, must be in writing, subscribed by the defendant and his wife, and acknowledged and recorded in the same manner as conveyances of real estate, otherwise the lien of the mechanic is subordinate to the right of homestead.

MORTGAGES OF FUTURE CROPS.—The Minnesota statute relating to the filing of chattel mortgages is applicable to mortgages of future crops, the seed for which had not been sown at the time the mortgage was executed, and which were, ther fore, not literally *in esse*. So held by the Minnesota Supreme Court in the case of Miller *vs.* Chapel. The Court says that the theory upon which chattel mortgages of crops to be grown are supported is that they are property having a potential existence, and that the mortgagor being in possession of the land upon which they are to be grown, has a present vested right to have the crops when they come into actual existence.

USE OF PUBLIC HIGHWAY.—According to a late decision of the New York Supreme Court (McCaffrey vs. Smith) neither the State legislature nor a village can confer authority on a person to occupy part of the public street as a hack stand as against the adjacent lot owners. The court said: The legislature undoubtedly had the power to authorize the village authorities to pass ordinances and by-laws (which they might enforce) limiting and restricting the use which the public might make of the streets beyond their rights of travel—ordinances which could be enforced as against the adjoining owners themselves, for the purpose of keeping the streets open to free and uninterrupted travel. But the legislature had not the power, neither had the municipal authorities, as against the adjoining owner, to confer upon any person the right to make use of the highway for any other purpose than to pass and repass without the consent of the owner of the fee.

CHATTEL MORTGAGE.—One Stewart held a chattel mortgage upon wheat and certain other personal property belonging to one Witherell. The mortgage, which was admitted to be usurious, contained a clause authorizing the mortgagee to take possession of the mortgaged property before the mortgage became due. A few days before the mortgage matured Stewart procured from Witherell a writing by which the latter in terms "turned over the property" covered by the mortgage to Stewart. The wheat, however, was not removed, but still remained in Witherell's granary and under his control. Stewart afterward came to Witherell's premises and without his consent removed and sold the wheat. The Supreme Court of Minnesota held (Witherell vs. Stewart) that the mortgagor was entitled to recover the value of the wheat taken in an action for the conversion of the same.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

WHY MAIDS WILL WED.

A GOOD wife rose from her bed one morn
And thought with nervous dread
Of the piles on piles of clothes to be washed
And the dozens of mouths to be fed.
"There's the meals to get for the men in the field,
And the children to fix away to school,
And all the milk to be skimmed and churned—
And all to be done this day."

It had rained in the night and all the wood
Was wet as it could be,
There were puddings and pies to bake
And a loaf of cake for tea;
And the day was hot, and her aching head
Throbbed wearily as she said:
"If maidens but knew what good wives know
They'd not be in haste to wed."

"Annie, what do you think I told Ned Brown!"
Called the farmer from the well—
And a flush crept up to his bronzed brow
And his eyes half bashfully fell.
"It was this" and coming near he smiled,
"It was this: That you are the best
And dearest wife in town."

The farmer went back to the field,
And the wife, in a smiling, absent way,
Sang snatches of tender little songs
She'd not sung in many a day.
And the pain in her head was gone and her clothes
Were as white as the foam of the sea,
And her butter as sweet and golden as it could be.
The night came down—
The good wife smiled to herself as she said:
" 'Tis so sweet to labor for those we love,
It is not strange that maidens will wed."

—*New Age.*

OF INTEREST TO WOMEN.

FROCKS for children are loose and short-waisted, with full skirts and wide belts. Coats are made after the same model. Woolen gowns are the only thing for street wear except in the case of old ladies, who may wear gray or black silk.

A pretty style for a little girl is a Gretchen frock with puffed yoke, and puffs in the armhole to match. Much velvet, astrakan and plush is used for pockets, vests, collars, etc., on little girls' frocks and jackets.

The author of "John Halifax" says that every girl who is not entirely dependent on her male relations—a position which, considering all the ups and downs of life, the sooner she gets out of the better—ought by the time she is old enough to possess any money to know exactly how much she has, where it is invested, and what it ought yearly to bring in. By this time also she should have acquired some knowledge of business—bank business, referring to checks, dividends, and so on—and as much of ordinary business as she can. To her information of a practical kind never comes amiss, especially the three golden rules, which have very rare exceptions: No investment of over five per cent, is really safe; trust no one with your money without security, which ought to be as strict between the nearest and dearest friends as between strangers; and lastly, keep all your affairs from day to day in as accurate order as if you had to die to-morrow. The mention of dying suggests another necessity—as soon as you are 21 years of age make your will. You will not die a day the sooner; you can alter it whenever you like; while the ease of mind it will be to you, and the trouble it may save to those that come after you, are beyond telling. It cannot be too strongly impressed upon every girl who has or expects that not undesirable thing, "a little income of her own," what a fortunate responsibility this is, and how useful she may make it to others. Happier than the lot of many married women is that of the "unappropriated blessing," as I have heard an old maid called, who has her money, less or more, in her own hands, and can use it as she chooses, generously and wisely, without asking anybody's leave, and being accountable for it to no one. But then she must have learned from her youth upward how to use it, she must not spare any amount of trouble in the using of it, and she must console herself for many a lonely regret—we are but human, all of us!—with the thought that she has been trusted to be a steward of the Great Master. Such an old maid often does as much good in her generation as twenty married women.

A PLEA FOR THE GIRLS.

"WHAT'S mine's mine" is a selfish saying, perhaps, yet what a satisfactory feeling it implies. To think that the veriest trifle belongs to us absolutely,—"a poor thing but mine own." And here we encounter a very great trouble to many girls. So very many well-meaning parents, while supplying all the material necessities for their daughters omit a greater need than all,—a little independence. We do not mean independence of parental duty, or freedom from the loving bondage of home life, but the independence of possessing something—it may be the veriest trifle, for personal use and expenditure.

We often hear men complain that women have no idea of spending money aright, or of keeping any record of the way it has been spent. Now, if a girl, from babyhood until marriage, is supplied with all she requires, without purchasing anything herself, excepting stray confectionery, it is not at all probable that her housekeeping expenditures will be marked by great prudence or economy. She may have some ideas of cost, and a vague idea of being economical, but she will be wanting in judgment. She would be something like Mrs. Oliphant's Lady Jane, who studied authorities on domestic economy when thinking of marriage with a poor man, and decided to buy only solid silver dishes, as they would obviate the expense of breakage, and keep a competent French cook, who would be so much more economical than an ordinary one.

The English plan of giving each girl an allowance of so much—or so little—on which she is to dress herself and pay all ordinary expenses, is admirable, and worthy of being more extensively adopted in this country. Where it is unnecessary or impossible for a girl to earn her own living there is every reason why she should have her own allowance. It should begin upon her leaving school, when she has, presumably a fair stock of clothes to begin with. The amount of the allowance and the purposes for which it is expended must be the result of circumstances. But one thing must be unchangeable: all gifts or charitable expenses must come out of the allowance; it must be an early lesson that gifts otherwise purchased are not personal gifts at all.

This matter of allowance or income is doubly an act of justice when the daughter is an energetic worker in the house. It is her bounden duty and service to work for her parents. Granted; but the duty of children should not cause us to lose sight of the duty of parents. And if regular work, well performed, is part of the daughter's service, some little compensation will show her that her parents appreciate it, without causing it to take a strictly commercial aspect. We repeat, a fixed allowance, that a girl may regard as her very own, will give her independence of character, and ground her in habits of prudence and economy that will be of infinite benefit to her in after life.

HOW MANY HOURS FOR SLEEP.

"Now blessings light on him that first invented sleep! It covers a man all over, thoughts and all, like a cloak: it is meat for the hungry, drink for the thirsty, heat for the cold, and cold for the hot."—Don Quixote.

Adages are not always to be depended on for good advice. The old saying in regard to sleep "nine hours are enough for a fool" has frightened many people from taking a rest that was necessary to them, "Nature takes five, custom seven, laziness nine and wickedness eleven," is wrong in at least two of its assertions. There are very few instances in which nature does not demand more than five hours sleep. It is true that sleeping, like eating is very much a matter of habit, and you may train yourself to dispense with more than five hours sleep, as you may to omit the third meal of the day. How long you will flourish under such a *règime* will depend upon the strength of your constitution. You may fare like the man's horse, who, when it had become reduced to a diet of one straw a day, in the most ungrateful manner, died on his hands.

A person may need nine hours sleep out of the 24, without being either lazy or foolish. Indeed he is a wise man if feeling that he requires them, he is sensible enough to take them. Goethe, when performing his greatest literary feats, took nine hours sleep.

A full grown adult in a healthy condition, will seldom require more than eight. If, however, he discovers that he is not sufficiently refreshed by eight hours, he should take more. It is a pretty safe rule to sleep as long as you are sleepy. "There are people," says a writer, "who are wise enough to eat when they are hungry, but who have never attained that higher degree of wisdom to sleep when they are sleepy." Unless you are a very lazy person indeed, you are not likely to take more than your constitution requires, for, of course, dawdling in bed is not sleeping.

By shortening the necessary hours for sleep, you may bring upon yourself "insomnia." There are scientific writers on the subject who claim that the best remedy for this is to learn to sleep in the daytime. This is very well where from some cause, work, watching or pleasure you may have failed to get your needed sleep for a night or two. There is undoubtedly a great virtue in naps, even short ones, and the art of napping in the day-time, although I could never acquire it, is a desirable one, and like most arts is a matter of practice. Still it is a bad practice to get into the habit of turning night into day, and if you are not kept awake by care or illness, but merely have lain awake because you could not sleep, I should recommend you to fight the consequent drowsiness of the next day, in order that you may, if possible, resume your natural rest at night. Sleeplessness is generally the result of an unfortunate habit of "thinking," generally on unpleasant subjects after one has retired for the night. Dr. Frank Hamilton, a great physician and a wise man, said: "Gloomy thoughts prevent sleep. The poor and unfortunate magnify and increase their misfortune by too much thinking. 'Blessed be he who invented sleep!' but thrice blessed be he who shall invent a cure for thinking." MARGARET NEWMAN.

THE AGRICULTURAL FAIR.

How much one's ideas are awakened on entering a country fair ground. Here are articles of almost every description placed for inspection, some of them cannot be equaled in our estimation, and such things create in us a desire for the improvements of modern ways. In one of the late RURALS was a picture of the Exposition building at Hornellsville. It was at this place I had the pleasure of attending a fair. On entering the grounds from the east, on either side were displayed the agricultural implements. One, a self-binder, was run by steam on the gounds to show its merits. Among other things that attracted our attention were the plows, harrows, drills, hay-tedders, potato diggers, reapers, mowing machines, cultivators, and all the mechanical appliances used on the farm. Passing along we entered the exposition building. About the first thing that met our gaze was the exhibit from North Carolina. I shall not attempt to name all the exhibits but some were as follows, flax, cotton, jute, sorghum cane, broom corn, sugar cane, crab grass, Hungarian, Red Top, Native clover, corn, chufas, fruits and nuts of every kind and description. There were beans no larger than the smallest pea, that looked very nice indeed. It was interesting to view the productions of that far-off sister state.

At each end of this building is a staircase leading to the second floor. At the east end on this floor is the picture gallery. In addition to the pictures there was one collection of coins that contained 1700 pieces; another collection of foreign coins contained one that was over 1000 years old. The display of arrasene and crazy work was exceedingly fine. There were numbers of silk quilts mostly crazy work, but one that was not of this style contained 9,534 pieces. A novelty in carpets was a hit or miss worsted and silk rag carpet. Some of the quilts had hand-made lace around them, and others had a border of dark maroon velvet pointed; on each point was a ball of old gold and maroon alternately. A large octagon frame contained 92,239 pieces in feather flowers showing much skill. One more thing worth mentioning was the floral hall on the first floor situated in the central part of the building. The flowers were arranged in pyramidal form; in the centre of this a fountain sent its mist and spray over all. Scattered among the flowers were pampas grass which grows in California; in its natural state it is cream colored or white, but these were colored in every hue.

There was a fine display of poultry of all kinds. One interesting exhibit was an incubator hatching young chicks; from 250 fertile eggs 218 chicks were hatched in three days. The little motherless things acted as though they were perfectly contented. In addition to this there was a dog show in a side pavilion.

On the second day Governor Hill was introduced by the Hon. H. Bemis, who gave us a very interesting address. He said: "The *farm* is the *true* home: and farmers should appreciate the good and blessed advantages connected with farm life. By diligent and careful study the farm home can be made the most attractive to all classes of people. Often the people from large cities flock to the country for more beautiful and attractive homes, even though they tarry but a while. True farming should not be confined merely to raising fine stock and horses, but the farmer should look well to the surroundings of his home." In his address the governer said: "I have known some men to be very particular in cutting every spear of grass in their fields, to have them look smooth and nice and at the same time the front yard where the lawn ought to be would be filled with tall weeds and grass. It would pay farmers to invest a few dollars and a little time in making their homes more attractive by planting and setting out trees and flowers, annexing a piazza or two with trailing vines running here and there. Also have bright and cheerful pictures arranged in your rooms together with other things that add to its attractiveness."

The helpful words of these addresses were among the many things calculated to instruct at this fair, and it was unanimously decided that these annual gatherings should do much for the social and material advancement of the class benefited by them.

MARY D. THOMAS.

GOLDEN GRAINS.

SOMEBODY has well said that a woman should never accept a lover without the consent of her heart, nor a husband without the consent of her judgment.....

THE Christian at Work says: "Every new church built is a fresh and emphatic announcement to every noisy infidel and scientific agnostic that the people are not yet ready to throw away their Bibles, their God, and their hope of immortality. Let such notices be multiplied on every hand. The best reply to an infidel is to build a church, and thus propagate the pure spirit of the Gospel."..... .

A PRIDE of doing all work well, and for the sake of doing it well, can be taken in almost any department of household labor. Happy the woman who has learned the secret and the art of how to get, and getting the most recreation possible out of her ordinary tasks.....

IN the light of duty performed, no life can be wholly commonplace, and in the seeking of what the highest is, many a truth will be stumbled upon which can never be found by any who work from lower motives. And in experience of every day life, the words of the German poet are verified, that

"Rest is not quitting the busy career—
Rest is the fitting one's self to one's sphere."....

A WITTY old deacon put it thus: "Now, brethern, let us get a supper and eat ourselves rich. Buy your food, then give it to the church; then go and buy it back again; then eat it up, and your church debt is paid."..... .

A LOVE of good books is one of the best safeguards a man can have.....

A REAL gentleman is as polite to a little girl as to a woman.....

THE right word is always a power, and communicates its definiteness to our action...

WALK boldly and wisely in the light thou hast; there is a hand above which will help thee on.....

A SWEET THING IN CORN.

THE picture shown at Fig. 393, which we

Fig. 393.

have re-engraved from a German paper, may give the ladies a new idea. We have no suggestions to make. It is rarely wise for members of the sterner sex to attempt to pry into the secrets of feminine loveliness. We make more of a success as critics, showing our approval in an earnest manner whenever the ladies seem particularly attractive, without detailing the various combinations of colors and shapes that have produced the pleasing effect. We see no reason, however, why bright corn husks or even a corn cob will not look just as well on a lady's hat as a collection of feathers or dead birds. The corn ornaments would certainly show a kinder heart, at least. A BROTHER.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

"JUST HOW."

ALL branches of housework can be greatly lightened if we only know "just how" to go at the task.

When the clothes are brought in from the line, do not let your servant throw them into the basket helter-skelter in a crumpled heap. Fold them smoothly piled one upon another on the ironing table and cover with the ironing blanket. In the morning they may be sprinkled in half the time; roll up tightly until ready to iron.

A carpet can be brightened and cleaned by

scattering corn-meal or salt over it and giving a second sweeping. It should be thoroughly swept first, however. It will also look clean much longer if a tablespoonful of pearline be dissolved in a pail of warm water, and the carpet be wiped with a flannel cloth wrung out of this. Change the water as often as it gets much soiled.

If oil-cloth be occasionally rubbed with a mixture of beeswax and turpentine, it will last longer.

China that has become stained with tea or coffee can be made to look as good as new by scouring with brick-dust.

A pine floor can be stained oak-color by washing it with a solution of one pound of copperas dissolved in a gallon of strong lye.

Clean irons are one of the marks of a good housekeeper. If your irons trouble you by dropping black specks from the top or sides when ironing, put them into a pan of warm soap-suds and give them a thorough scrubbing. Dry them quickly or they will rust.

Blacking the kitchen stove is the *bete noire* of many a tidy housewife. An ingenious friend of mine saves all her paper bags from the grocery, and when this troublesome task has to be performed, she slips her hand into one of these bags. The hand is not at all soiled, the bags are much more easily put on than gloves, and can be dropped into the stove when you are through with them.

EXPERIENCE.

BUSY HANDS.

A COUNTRY-BRED woman living in a large city gave lessons in cooking to half-a-dozen working-girls. She found them ignorant of the simplest details of work, because they had never seen it done. If they had grown up in country homes she would have found them already familiar with the theory of cooking and only in need of practice.

Washington Gladden believed that country boys made the most successful men, so he sent letters to 100 successful men in all ranks of city life, asking them where their boyhood had been spent, and how their time, out of school hours, was used. The replies showed that most of them were from country homes where, out-of-school duties trained their hands and gave them habits of industry. In many large cities there are now schools where little city girls can learn to cook, set a table neatly, sew, darn, mend, sweep and dust, and their brothers are taught to use carpenter's tools, and to model in wood such things as houses, fences, and furniture, and as their lessons advance, to make many things of value and beauty, of suitable sizes for use. The Children's Industrial Exhibition, held last Spring in New York City, showed the work from such schools (and some work done out of schools) by children all over the country. And there is a stir, and a flutter of little hands in the cities as they busy themselves with these new lessons. The country children already know many things these little folks are studying out with active fingers; why can they not be helped to learn still more? Are there not possibilities for cooking, sewing and carpentering classes in the country?

A class of six or more little girls might meet once a week under the guidance of a grown-up sister, auntie, or mother, and cook the meal they eat together, each one bringing a share of uncooked materials and doing a share of the work, the teacher watching and directing all the work, but doing none. Setting the table and table manners would come in for a share of her care. A work-shop for the boys might be organized during the season when there is the least farm-work, and some farmer, handy with tools, could greatly benefit the boys of the neighborhood by giving them lessons in simple work with hammer, saws and nails. Studying books is good; training the hands to make the study practical is better.

The advantages of such classes would be many: first of all, the children would feel that good work is important, and it would become interesting, and, instead of hurrying through their out-of-school duties in the most careless way, they would find a pleasure in doing them well. Then, in a class, if only of three or four, the sense of companionship and the efforts made by each one to work as well as the rest would add a charm for the children. Try something of this kind and report the results.

ALICE BROWN.

PAINT FOR KITCHEN FLOORS.

FOR the benefit of several inquiring women, we wrote to Mrs. Fisher asking as to the paint for kitchen floors that she approved of in one of her housekeeping serials. She replies:

"The paint I alluded to was specific in nothing but color—as near the hue of dried mud as black and white can be mixed—a dust-gray. So many kitchen floor paints in yellows and browns, show every spot so readily that I thought the exact shade that least shows "dirt" ought to be put up in cans and labeled, 'Kitchen Floor Paint.' Some manufacturer of paints ought to act upon this suggestion.

MARY WAGER-FISHER."

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

HOUSEKEEPING RELICS.

THERE is not a housekeeper who is willing to say that housekeeping is not an advancing art, but there are not wanting women who do not practice in accord with this belief. Why can we not lay down the antiquated things and cease from retrogression? Why use the iron tea-kettle when the neat tin one is lighter and better? Why wring the clothes by hand when there are a score of wringers? Why boil your coffee when you well know it should never boil? Why maintain a yeast jug when for two cents you can buy a cake of the compressed yeast? Why sweeten cake with molasses when sugar is equally as cheap. Why buy flour by the sack and pay $9, when $7 will pay for a barrel of the same flour? I cannot answer. It is not because women are ignorant of the superiority of wringers, compressed yeast, tin tea-kettles, and the best sugar. It may be because we are thoughtless, and content to be behind the times in some things. Who can tell?

MRS. M.

HAPPINESS may not be the aim and end of existence, but it should be cultivated in every lawful way; for the happy child doesn't whine and fret; the happy woman doesn't scold, and the happy man doesn't darken his home when he enters the door.

DESK ORNAMENTS.

TAKE three penholders with pens in them, and paint them red or gild them; then tie together with narrow ribbon and arrange so that they will stand upright like an easel. Attach to this for holding pens one of the little silver or gilt buckets that can be bought at any store where materials for fancy-work are sold. It may also be used to suspend a photograph or birthday card from.

LETTER POCKET.

A pretty letter pocket to hang by the side of a desk is made from a palm-leaf fan, which may be covered with silk, satin, velvet or plush, or even with handsome cretonne. Put a pocket, lined with pasteboard to make it keep in shape, on the front of the fan for holding letters. Suspend with a handsome bow of contrasting ribbon.

LOVER OF FANCY-WORK.

CHILD'S BOOK SATCHEL.

A DURABLE and inexpensive book satchel is made from a common coffee sack, but it should be a fine one. Cut it of the required width, and about three-quarters of a yard long. Work a border in cross-stitch, in red Germantown wool, about an inch and a half from the edge, so that when it is doubled the border will be all around both sides. Cut a piece nine inches long and three wide, and double it together until it is half an inch wide. Whip the edges together with the yarn. Cut another piece and do the same with it, and fasten these pieces on the top for handles. Line the satchel smoothly with red calico.

WALL-SPLASHER.

A pretty one is made of deep gray crash, worked in seaweed design, with toilet set and cover stand to match. The edges of the splasher are fringed, and it is fastened to the wall with four bows of light and dark ribbon to match the embroidery.

RAG MATS.

Old stocking legs make very good mats. Cut them in strips finer than for carpet rugs, and sew and wind into balls. Crochet with a very coarse hook, in single crochet stitch either round or oblong. If you have enough of any particular color, you can make a center of it and then work hit or miss. They are durable and look very well in country bedrooms.

ELSIE.

DOMESTIC RECIPES.

PACKING EGGS FOR WINTER.

LAST year I found the eggs I had carefully packed in salt, according to my usual custom, were a great disappointment. The yelks had either become hardened or adhered to the shell, and not half of my store proved available for cooking purposes. Mentioning this to a friend who is an exceedingly good housekeeper, she said, "Your mistake was in using salt at all, to pack them in. It always has a tendency to make the whites of the eggs watery and the yelks solid. Of all the materials I have ever used I prefer bran or middlings; then I never have any trouble." I shall try that this year and see how it works. I try all the eggs I pack, to make sure they are good to begin with. Roll up a newspaper so that an egg will just fit in one end of the roll, and hold it up towards the light, and the veriest novice can tell at once a good, fresh egg from a poor one. Eggs put away for Winter are better if laid after the hottest weather is passed—say in September. Once on the recommendation of a friend I packed a quantity of eggs in ashes; but when I attempted to use them they were completely cooked. I have also tried lime-water with similar results. A cool, dry room is best for keeping them well. Most cellars are too damp. A friend says she has succeeded well in keeping eggs in salt if they were put down in stone jars. She thinks such jars are more nearly air-tight than wooden vessels.

ENGLISH CHRISTMAS PLUM PUDDING.

Two pounds of raisins, two pounds of currants, one-fourth of a pound of citron, or lemon-peel; one teacup of sugar, two thick slices of bread crumbled fine, seven eggs, a teaspoonful each of cloves, cinnamon and nutmeg grated; two pounds of beef suet, a piece of butter the size of an orange: about two pounds of flour. Mix it all with milk or water and boil four hours in a bag. This quantity makes two large puddings, and may be kept a month. Steam slices as it is wanted and eat with a sauce.

HICKORY-NUT CAKE.

Two cups of sugar, one cup of butter, three cups of flour, one-and-a-half cup of milk, one coffee-cup of nut meats, the whites of six eggs, one-and-a-half teaspoonful of baking powder mixed in the flour.

LEMON CAKE.

Two cups of sugar, one of butter, four of flour, three eggs well beaten, one cup sweet milk, one grated lemon, three teaspoonfuls of baking powder. Beat butter and sugar together first, then add other ingredients.

AUNT RACHEL.

EGG TOAST FOR INVALIDS.

Beat the yelks of four eggs and the whites of two thoroughly, and mix them with two tablespoonfuls of butter; put this in a small sauce-pan and set it over the fire, stirring in one direction until thoroughly hot. Have ready some thin slices of bread delicately toasted, and spread with the mixture of egg, and serve very hot.

Or, put three ounces of butter into a bowl, and stand the latter in boiling water until it becomes liquid. Now add four well-beaten eggs to this, pour into a sauce-pan, and set it over a slow fire, moving it around in one direction until heated; it must not be allowed to boil. As soon as warm pour it back and forth from the sauce-pan to the bowl until thoroughly hot. Have ready some nicely toasted bread, and spread this over while hot.

NURSE.

RICE TOAST WITH POACHED EGG.

Boil some rice the day before and set away in a flat dish until morning. Cut it in slices, brush each slice over with melted butter, slightly grease the broiler, and broil over a rather slow fire. Butter the slices and drop a poached egg on each.

CREAM POTATO BALLS.

Mix two tablespoonfuls of melted butter and the whites of two eggs well-beaten with a pint of finely mashed potatoes, season to taste and roll into little balls. Dip each ball in cream, roll in cracker dust, place in a buttered dish, and bake until a delicate brown.

COOK.

QUESTIONS ANSWERED.

TO REDRESS MAHOGANY; A MAHOGANY STAIN.

MR. A. H. asks how to clean and varnish mahogany furniture, also how to stain wood in imitation of mahogany.

ANS.—Remove every particle of the old varnish with soda water and *fine* sand-paper. Next rub well with powdered pumice stone and raw linseed oil, using as little oil as possible. Several thicknesses of flannel tacked to a block of wood of convenient size for handling will be found to expedite this part of the work. Next wash the furniture with warm water and Castile soap. After the wood has become thoroughly dry, give a coat of the best furniture varnish. Use a fine varnish brush for the purpose. The varnishing should be done in a warm room free from dust, and by a person who understands laying it on. For the stain, boil one-half pound of madder and two ounces of logwood in a gallon of water. To be applied with a brush while hot. When dry go over the whole with a solution of two drams of pearlash in a quart of water. Varnish after the wood is thoroughly dried.

WHEN buying dress goods that are not to be worn out at once, for a growing girl, it is economy to buy a yard or two extra for remodeling the dress for another season.

Wash window glass in clear, warm water—not soap-suds. Add a little ammonia, borax or baking soda to the water.

Why shouldn't the boys have as pretty and cozy a room as their sisters?

Miscellaneous Advertising.

Debility

Languor, and Loss of Appetite, are cured by the use of Ayer's Sarsaparilla. It removes that terrible sense of *Constant Weariness*, from which so many suffer, gives tone and vigor to the stomach, and restores health and strength more surely and speedily than any other medicine.

Three years ago I suffered from Debility and Loss of Appetite, the result of Liver Disease. After having tried various remedies, and consulted several physicians, without benefit, I was induced to take Ayer's Sarsaparilla. The first bottle produced a marked change, and the second and third accomplished so much that I felt like a new man. I have, since that time, taken about one bottle every year, and had no recurrence of the trouble.—William E. Way, East Lempster, N. H.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

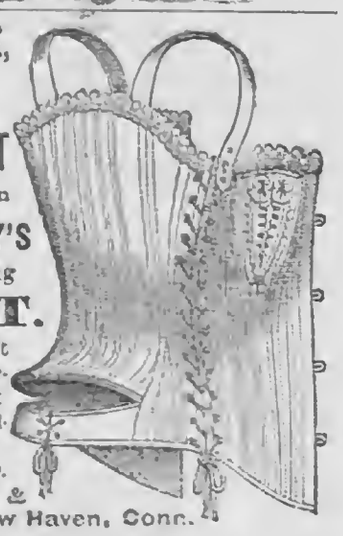
SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

FRIENDS, IF YOU ARE IN ANY WAY INTERESTED IN **BEES OR HONEY,** We will with pleasure send you a sample copy of the **Semi-Monthly Gleanings in Bee-Culture,** with a descriptive price-list of the latest improvements in **Hives, Honey Extractors, Comb Foundation, Section Honey Boxes,** all books and journals, and everything pertaining to Bee Culture. NO THING PATENTED. Simply send your address, WRITTEN PLAINLY, to A. I. ROOT, MEDINA, OHIO.

WANTED A WOMAN of energy for business in her locality. Salary $50. expenses. E. J. Johnson, Manager, 21 Barclay St. N.Y.

"I NEVER!" Ladies, we make a specialty of giving Premiums for the forming of Tea Clubs. Now is the time to get up orders for our celebrated TEAS and COFFEES. Teas of all kinds, from 30 to 75 cts. per pound. **We defy the world on price and quality. No house can give the same quality of goods and premiums as we do.** We have a host of useful and ornamental articles to select from. Send us your address (mention this publication) and we will mail you our Illustrated Price and Premium List, and full particulars. Address NATIONAL TEA & COFFEE CO., Washington St., Boston, Mass.

ELEGANT SHAPE, HEALTH and COMFORT Perfectly Combined in **MADAME FOY'S** Skirt Supporting **CORSET.** It is one of the most popular and satisfactory in the market For sale by all leading dealers. Price by mail $1.50. FOY, HARMON & CHADWICK, New Haven, Conn.



GOLD MEDAL, PARIS, 1878. **BAKER'S Breakfast Cocoa.** Warranted *absolutely pure Cocoa*, from which the excess of Oil has been removed. It has *three times the strength* of Cocoa mixed with Starch, Arrowroot or Sugar, and is therefore far more economical, *costing less than one cent a cup.* It is delicious, nourishing, strengthening, easily digested, and admirably adapted for invalids as well as for persons in health. **Sold by Grocers everywhere.**

W. BAKER & CO., Dorchester, Mass.

GENUINE YANKEE SOAP

After half a century is still without an equal, **AS A SHAVING SOAP.** Its rich, mild and lasting lather leaves nothing to be desired. *All Druggists keep it. Avoid Imitations. Trial Samples by Mail, for* 12 cts. The J. B. Williams Co., Glastonbury, Conn., Formerly Williams & Bros., Manchester, 1840.

10 Scrap Pictures and Agent's Sample Case for a 2-cent stamp. HILL CARD CO., Cadiz Ohio.

Virginia Farms. Mild Climate. Cheap Homes send for Circular. A. O. BLISS, Centralia, Va.

News of the Week.

HOME NEWS.

SATURDAY, October 9, 1886.

IN the Canadian Northwest Territory the Gros Ventres Indians lately killed six of the Blood tribe, belonging to the Crowfeet reservation. The Bloods went at once on the warpath and on their way to the Gros Ventres settlement killed about 100 white settlers, perpetrating horrors as diabolical as those of the Apaches in the South. All the whites at the reservation, including the agent, have been massacred. In a fierce battle between 60 Gros Ventres and the Bloods over 50 of the former were killed and scalped, and 20 of the latter were killed and 30 wounded. Two companies of mounted police are trying to put down the rising; but the whole force—1,500—will probably be needed, besides 2,000 infantry and cavalry on their way to the scene. A general rising of the Indians is feared, as they have been grossly oppressed by dishonest officials and speculators.....Geronimo and his followers are still at San Antonio. Gen. Miles says he had full authority from Gen. Sheridan to act as he pleased in warring against them and giving them terms. They had killed over 400 whites in less than two years, and it was better to accept their surrender conditionally than to risk more outrages. Geronimo and band are reported to have been equipped, clothed, armed and encouraged in their deviltry by Mexicans who offered them a market for their plunder. Other bands of Apaches are still on the war-path in Arizona and New Mexico. .....Tuesday the steamer Mascotte, plying between St. Louis and Cape Girardeau, Mo., burst a boiler flue below Grand Tower—passengers,25; crew,40; burned and drowned, 30; rescued, 35.....The Dominion Government has special agents in this country trying to induce French-Canadians to emigrate to Manitoba—considerable success.. .....Members of the civil service in Canada have just been ordered to take the oath of allegiance to the Queen: on refusal their pay will be stopped. Some are suspected of being Fenians and more of being disloyal..... The Court of Appeals of the State of New York State has confirmed the conviction and sentence of boodle Alderman Jachne. The other 14 boodle Aldermen, now under $25,000 bail each, are soon to be tried..... ....Capt. Henn, the yachtsman, is out of pocket some $10,000 by his experiments with Galatea.....The United States Circuit Court at Cleveland, Ohio, has decided that the local option feature of the Dow Law is not in conflict with the Federal laws. It was maintained that the law was against the United States Constitution as it deprived a citizen of his property ....Mayor Courtney of Charleston has announced that no more public aid is needed. Trade brisk; all busy repairing damages and making money. Several slight earthquake tremors during the week. "Center of disturbance" has moved about 200 miles southwest. Total loss by earthquake, $5,000,000..... .....Eighty-one and a quarter tons of quinine were used in the United States during the past year, according to a report to the National Druggists' Association made Tuesday at Minneapolis. And still we have earthquakes and shakes!..... .....Of the $3,000,000 given to the South by Mr Peabody some years ago for educational purposes, one-third has been lost by repudiation of Southern State bonds..... ....There are 30,000 employed in the meat-packing business in Chicago. Last May they struck for eight hours, and many of them got what they wanted. The employers of the eight-hour men now say they can't compete with the others, and a lock-out or strike is threatened.....The Undertakers' Convention, at Cleveland, Ohio, the other day protested earnestly against the growing practice of cremation, and feelingly appealed to the public to stick to the old custom of being put under the sod by the association..... ....The Oklahoma boomers have finally given up, having generally gone to work on the railroad now building through the Indian Territory. Their recognized leaders, including Capt. Couch, declare no attempts will be made in opposition to the present policy of the Government, and that they will await and respect the decision of Congress.....The American fishing schooners Darsley and Scyylla, seized by the Collector of Customs at Halifax on Sunday, were released on payment of a fine of $400 each, Tuesday. . . ..Judge Gray, of Chicago, Thursday,denied a new trial to the Anarchists, seven of whom were sentenced to death and one to imprisonment for life. They made vehemently bitter harangues in the court-room, but are likely now to meet with the fate they so richly deserve.....The Atlanta Constitution avers that there is more suffering among the laboring people in Augusta, on account of the strike of cotton operatives, than there is in Charleston on account of the earthquake—3,000 out.. .... One thousand delegates, representing the million or so Knights of Labor, assembled in the armory of the 1st Virginia Regiment at Richmond, Va., Monday morning to begin the two-weeks' session of the 10th annual convention of the order. Master Workman Powderly called the gathering to order and made a rousing speech. Governor Lee, of Virginia, gave an address of welcome. Routine work almost exclusively during the week. Powderly will be re-elected..... ....For the quarter ended September 30, there were 1,932 failures in the United States, as compared with 2,173 for the third quarter of 1885. The liabilities, however, are $27,500,000 for the three months of 1886, as against $23,874,000 for the corresponding period in 1885.....Justice Gordon of the Pennsylvania Supreme Court Monday decided that the store-order system, under the act of June 29, 1881, was unconstitutional and void,inasmuch as by it "persons are prevented from making their own contracts." .....The President is looking right sharp after Federal office-holders who, contrary to his views, have engaged in political conventions.....Wiggins is going to leave Ottawa. The falsity of his predictions is making the weather too hot for him.....The President will visit the fair of the Virginia State Agricultural Society at Richmond, Va., the 21st. Mrs. Cleveland will probably accompany him. .....George Bancroft celebrated his 85th birthday last week.....At the jug-handled election in Ga., Wednesday, the Democrats made a clean sweep. Gen. J. B. Gordon, Governor.....Sec. Manning is to remain at the head of the Treasury.....There is not an iota of doubt of a mighty Blaine boom nearly everywhere among Republicans.....California cigar manufacturers who discharged their Chinese workmen, and employed Eastern men, are discharging the latter and again employing Mongolians. The "white" factory stamps were easily procured by the "Chinese" factories, which used them on their goods and undersold the others. To meet this competition the Chinese had to be taken back..... Of the 61 bodies reduced in the crematory at East New York since December last, only 21 were Americans..... ... .The steamer Anchoria of the Scotch Anchor line, plying between this city and Glasgow, is now 22 days out from that city and 12 days overdue. She has not been seen, though vessels are constantly passing both ways over the course she would take. Many report that her machinery was out of order before she started, and that some of her crew refused to go to sea in her. Her agents here still say there is hope, and that she will soon make some port in a disabled condition. Great anxiety among the friends of those on board, most of whom seem to have been from the country, judging by the number of telegrams received by the agents here .....

FOREIGN NEWS.

SATURDAY, Oct. 9, 1886

AFFAIRS in Bulgaria still in a muddle. Gen. Kaulbars still scolding, threatening and blustering unless the Czar's demands are obeyed. Issues orders to the troops to disobey the government under penalty of the Czar's displeasure and acts the part of an arrogant tyrant in a mutinous province. Has been traveling through the country trying to stir up the people against the Regency and in favor of Russia, but hitherto he appears to have been rebuffed by officials, troops and people, who do not seem very anxious to learn "the views and intentions of the Czar." Austria still determined to bar Russian aggression. Germany apparently playing a double game—not displeased with Austria, but very friendly to Russia. If Russia, Austria, Turkey, Italy and England become embroiled, Germany will doubtless try to pulverize France so utterly that she'll never recover. Outbreak of war possible any day; very probable within six months..... ....In British politics Lord Randolph Churchill, Conservative leader in the House of Commons, has put Lord Salisbury, leader in the House of Lords and Premier, completely in the background, and taken the place of Disraeli in speaking for and "educating" his party. In late speeches he has stolen Gladstone's thunder on all points except Home Rule for Ireland, and even in this respect he promises to introduce a bill giving Home Rule to each of the four provinces—Ulster, Leinster, Munster and Connaught. Churchill is now traveling, incognito, on the continent, and is expected to negotiate secretely, but in the name of the government, with Bismarck, Kalnoky and other great diplomatists about the Bulgarian trouble. ....In Ireland a vast number of notices of evictions indicate grave trouble in the near future. In England distress among the wage-earning class is very severe—thousands can't get work at any price; thousands are out on strike on account of recent reductions in wages, and hundreds of thousands are living on slim fare from day to day. Agricultural distress is so grievous that it is hardly possible for tenants to pay rents, so that a great number of farms are unoccupied and many more will be thrown up next rent day..

AGRICULTURAL NEWS.

SATURDAY, Oct. 9, 1886.

CONTAGIOUS pleuro-pneumonia is officially reported in parts of New York, New Jersey, Pennsylvania, Maryland, the District of Columbia, in one or two border counties of Virginia, and at Chicago. There are also some doubts as to its existence in Ohio, Kentucky, and Dakota. The Department of Agriculture is co-operating with the authorities of Illinois to suppress the plague there, and also with those of Maryland, paying for the destruction of infected animals and quarantining those that have been exposed. The authorities of Virginia, Pennsylvania, New Jersey and New York have not yet accepted the rules adopted by the Commissioner of Agriculture for co-operation in measures necessary for the extirpation of the plague..... ....The Ohio game laws, as amended at the last session of the Legislature, prohibit the killing of all song birds and all sparrows except the English sparrow. ..... The shrinkage in cattle values, together with reports of serious epidemics throughout the country, is causing great mistrust and uneasiness among Texas cattlemen. There are rumors that some of the most prominent have already become embarrassed, and that their paper has gone to protest. Extensive failures are looked for..... .....The Secretary of the Interior is considering a scheme to allow certain Indian tribes to utilize their lands by allowing them to take cattle of the whites to pasture at a fair consideration, but no white man to be allowed on the reservation..... It is proposed to locate all the Indians in Minnesota on one reservation. The change would throw upon the market over 3,000,000 acres of land The tobacco association of Lynchburg, Va., reports that the sales for the fiscal year just closed were 49,332,000 pounds of loose tobacco, 90 per cent. more than was ever before sold in one year.....Six thousand Percheron horses have been imported into this county, first and last; more than one thousand last year.....French Premier de Freycinet, replying to a deputation from the Bordeaux Chamber of Commerce, which prayed that the importation of American salt meats into France be prohibited, said that the government would consider the matter..... In the first eight months of this year Great Britain imported 80,508 live beeves from the United States, against 105,808 in same part of 1885; 140 cows, against 373; 5,225 sheep, against 9,625; no swine, against 67. The totals imported from all countries at the same time were 168,069 cattle, against 202,671 in 1885; 33,762 cows, against 36,033; 670,906 sheep, against 598,361; 14,722 swine, against 9,527... .....The corn canning of the country appears to be short. Complaints are heard from Maryland and Maine and also from the West; prices, therefore, are strong. .....It is alleged that many European wool contracts for America have been canceled by paying a penalty of from two to six cents bonus, and that all the wools in bond in America have been ordered back to seek markets at higher figures.....The average weight of hogs in Chicago last month was 230 pounds, the lightest September weight in over ten years. The average has been about ten pounds greater... .....No animal after leaving the Island of Jersey can be re-imported, except in the case of cattle sent to Great Britain for exhibition purposes, and these must be returned to the Island within fourteen days..... ....James W. Sykes, a large seedsman of Chicago, made an assignment last Saturday and was arrested Monday night for borrowing $38,000 from the banks, putting up as security warehouse receipts for seeds which had no existence.....First snow of the season at Marshfield, Wis., Oct. 2. Same day heavy frosts greatly injured vegetation nearly all over the nothern part of the country and as far south as Kentucky and North Carolina, doing a great deal of damage to tobacco..... .....The farmers of Wisconsin are very jubilant over their success in raising "the weed." If the prospect holds good Wisconsin will soon become one of the largest tobacco-producing States in the Union..... ....Destructive prairie fires are now raging near Moorehead, Minn., and in northwest and southwest Manitoba. Hundreds of settlers have lost a great part, or all, they possessed, including hay, stacked grain, fences, barns and often homesteads.....The cultivation of tobacco in Germany is decreasing, owing to the system of taxation. The decrease in the number of planters is 12,000, as compared with 1885.....Wool sales opened at Sydney, Australia, a few days since, at which prices show an average advance of something like 50 per cent, above those of last February..... .....At the Wilton, England, sheep fair, two weeks since, 70,000 animals were sold. Wether lambs sold at $11.75 to $14.40 each; fat lambs, $8.65 to $11.00; full-mouthed ewes, $12.50 to $15.00; wethers, $11.00 to $13.00. . .....It is claimed the Chicago's wool trade for 1886 will show an increase of 30 per cent. over last year, and Chicagoans assert that their market will soon pass Philadelphia and give Boston a hard fight for first place..... ....The California Southern Railway is sending out loads of grapes attached to each passenger train bound east. The rate this year is $450 a car, as against $600 last year.... ... ...Montana cattle to the value of $100,000 smuggled over the border will be seized by officials of the Canadian customs department. .... In September, Chicago received 198,215 cattle, 468,430 hogs, and 82,132 sheep—an increase in all kinds of stock over the same month last year .....During 1885 we exported agricultural implements to the value of $2,561,000 of which $1,348,000 was the value of the reapers and mowers..... ....The exports of live stock and dressed meats from Boston for the English markets last week were 1,013 cattle and 3,992 quarters of beef.....In the months of April and May, 1886, only four Short-horns were exported from Great Britain, and these came to the United States..... .... A telegram this morning from Camden, N. J., says pleuro-pneumonia recently made its appearance near Vincentown, Burlington County, and has spread to an alarming extent. The State Board of Health has attempted to eradicate it by killing infected animals and quarantining herds, but cases are still being found. State Veterinary Surgeon W. B. E. Miller, of Camden, has been ordered by the Government Department of Agriculture to examine into the contagion and report to the National Bureau.....Another from Chicago just as we go to press says notice has been given that persons removing milk for public use from premises infected by pleuro-pneumonia will be arrested. Owners of cows are advised to milk them on the floor, to prevent injury from neglect. The cattlemen say they are unable to pay men to milk these cows when the milk from them cannot be sold, and threaten to refuse to have the animals milked, and throw the responsibility of further sickness or disease upon the health authorities or the State Commissioner..... .....

The Value of Prompt Action.

"I SHALL move immediately upon your works," was the strong language of General Grant at one of the crises of his historical career. Such should be the declaration of every man and woman who feels himself or herself assailed by some lurking foe to health, and especially strong should be the resolution to act if the enemy has already intrenched himself in some vital part of the system. Consumption, Asthma, Neuralgia, Rheumatism, and kindred ailments become dangerous only when neglected. They can all be cured by Compound Oxygen if grappled with in proper season. Drs. STARKEY & PALEN send a Home Treatment that enables any one to cure himself in his own home. Send to them at 1529 Arch Street, Philadelphia, Pa., for a pamphlet giving testimonials. It costs nothing to obtain it.—*Adv.*

Crops & Markets.

SATURDAY, Oct. 9, 1886.

Returns received to-day from 36 of the principal grape-growing sections along the Hudson Valley show that the yield of Concords this Fall is enormous, and exceeds the most sanguine hopes of all interested. Already individual growers have shipped as much as 50 tons, and each expects to ship from 30 to 60 tons more. Large quantities of fruit are being shipped to Boston, Philadelphia, and to points north and west, in addition to the heavy freights now being sent by boat and rail to New York. Last year was a phenomenal season, but this Fall the estimates made show that the gross tonnage will exceed that of 1885 by at least 5,000 tons. The business has assumed such proportions between Cornwall and Coeymans, and in the country between Newburg and Rondout, a section 12 miles broad and over 30 miles in length, that scores of heavy producers, during the past month, saw the necessity of building air-tight "coolers." Hundreds of tons of the choicest fruit have been stored away this week, and the work has only fairly begun. The result will be that New York will be supplied with grapes until well along in the holidays and at reasonable figures.

One the curious features of the fruit culture along the Hudson this Fall is that ripe strawberries were gathered at 13 different points between Marlborough and Catskill on October 5 and 6.

The Baltimore Journal of Commerce publishes this morning special reports from the tobacco-growing sections of Maryland, Virginia and North Carolina. While a considerable part of the crop had already been gathered, the frost very seriously damaged what was still in the fields, ruiuing a small percentage of it, and thus still further reducing the yield. In some few instances the crop is stated to be as large as last year and the quality as good, but nearly all the reports claim that the yield will be much reduced, the estimates running from one-third to two-thirds of a crop, and with the quality, especially in parts of North Carolina and Virginia, very poor. In the great Durham district the yield is estimated at not over 40 per cent. of an average and of very inferior grade.

Heavy frosts, accompanied with ice, last Thursday night, did great damage to the cranberry crop in Burlington, Ocean and Atlantic Counties, N. J. At a moderate estimate the loss is put at 25,000 bushels.

A telegram yesterday from Grand Forks, Dakota, tells of a syndicate "composed of Detroit, Buffalo, Rochester and Scotch millers," which proposes to buy up all No. 1 Hard Wheat raised in the Red River Valley—not to speculate with, but to grind in their own mills. The No. 1 Hard of the Valley is worth from 10 to 15 cents more per bushel for actual grinding purposes than any other wheat, and hitherto it has been very hard to get it un adulterated by millers outside of Minneapolis, as that city controlled elevators along the railroad. The Northern Elevator Company is the only one that issues certificates of wheat stored in its elevators guaranteeing weights and grades, and during the present season the syndicate will confine its operations to the purchase of these tickets, and create such a demand for them as to induce farmers either to start their wheat with this company, or else force other elevator companies to guarantee their own weights and grades. It will begin business on the first of next month.

Packing operations in the West have been on a moderate scale the past week, the returns indicating a total of 140,000 hogs, against a like number for the preceding week, and 125,000 for corresponding time last year; total from March 1 to date 4,900,000, against 4,160,000 last year, making an increase of 740,000 hogs. The Eastern shipments of hogs have enlarged recently, which reduces the proportion available for Western packers. Values of hogs at Chicago have been maintained relatively higher than prices of product for future delivery, and are now about 45 cents per 100 pounds above last Winter's average price at that point, which would seemingly justify the view that, so far as relates to hogs, values may be expected to be lower than now ruling. Product for January delivery has sold this week down to a basis of about $3.60 for hogs, at Chicago, which is lower than the average price paid for hogs last Winter at that point.

The San Antonio, Texas, wool market has reached a point where buyers are holding off. The highest point touched last spring was 19 cents per pound, but this Fall it has run to 21¾ cents. The extremely high prices prevailing have scared off Northern buyers, and sales are consequently slow. The range has been from 17½ cents to 21¾ cents for exceptionally clean wools. A declension is looked for shortly. The total sales for the season, it is estimated, will be 4,500,000 pounds.

A cablegram to De Long Mayer & Co., of this city, on Oct. 6 says American apples had that day met with a very active demand at Liverpool, two steamers from New York and one from Boston having brought shipments. Prices as follows: Phœnix, $3.60 to $4.02; Greenings, $3.36 to $3.48; Baldwins, $3.12 to $4.38; Golden Russets, $3.12 to $3.60; Hubbardstons, $3.06 to $3.72, Kings, $5.04 to $5.28. De L., M. & Co. say apples of the frail nature of Astrachans will not stand the voyng , but the list of those that will do so is a long one: Baldwins, Seeks, Pomeroys, Jonathans, Russets, Kings, Phœnix, Spitzenbergs, Swaars, Greenings, Spies, Hubbardstons, Gravensteins and Newton Pippins all do well. Some shippers send all kinds and think that is the best plan. The trip across is now made in such a short time that apples keep very well, if they are sound when shipped and not over-ripe. The freight is about $1 a barrel.

The Russian Government has just issued its revised and final report of the Russian grain crops of 1885, which reduces the first estimate on wheat about 38,000,000 bushels. The final estimate is as follows: Winter wheat, 77,514,000 bushels; Spring, 100,196,000 bushels. Total, 177,811,000 bushels. The first estimate made last November was a total crop of 215,461,000 bushels. The total crop in 1884 was 266,056,000 bushels, and in 1883 was 218,440,000 bushels.

As We Go to Press wool is quieter, but strong. In spite of speculative buying, home prices are below foreign. The loss of cotton in Texas by the late storm is reported to amount to over 30,000 bales. Estimates of the loss to the Western tobacco crop are placed at from 5 to 10 per cent., Louisville reports inclining to the lower figure. There appears to be some doubt as to the extent of the loss by frost in the Virginia and North Carolina tobacco regions. Hog products are depressed and lower. There is no sign of a g ainn wheat, despite the late excellent export demand. Receipts at the West and Northwest have declined some. Flour is depressed and lower, with continued heavy foreign consignments.

MARKETS BY TELEGRAPH.

SATURDAY, October. 9, 1886

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 2¼c. lower; No. 2 Spring, 3½c. lower. Corn, 1¼c. lower. Oats, ¾c. lower. Rye, steady. Barley, 3c. lower. Flaxseed, 1¼c. lower. FOR SALE CHEAP,
IN BEAUFORT COUNTY, SOUTH CAROLINA,
MORGAN ISLAND,
One of the best Stock Ranges in the County,
About 2,000 Acres of Feeding Ground.
I have raised horses, cattle, and sheep on it for the last twelve years, and they have always kept fat the year round without any feeding but what they got on the Island and marshes. A ready sale for all the beef, mutton, and colts that can be raised on the Island, at good prices.
Price **$3,000.** One-half cash; balance in one or two years, with interest at 7 per cent.
ALSO,
MY HOMESTEAD PLANTATION,
On St. Helena Island,
Containing 200 Acres. Bounded on the North by Johnson's River navigable water. A part of the land has been highly cultivated for a few years, and will produce large crops. The soil is sandy loam. A grand chance to raise early vegetables for the Northern markets. About four miles by water from Port Royal Railroad and steamship landing. Steamers to New York every week.
Large two-story HOUSE, nearly new, finished throughout, with Pump on piazza that pumps good, cold, never-failing water from well 80 feet deep. New Stable, with cellar underneath and good muck beds near.
Price and terms same as for Morgan Island.
Titles guaranteed good.

BUHACH
THE GRFAT CALIFORNIA

INSECT POWDER.

A pure California production, an infallible exterminator of Roaches, Bed-bugs, Waterbugs, Flies, Fleas, Mosquitoes, Ants, Moths, and in fact all insect pests of the household, field, orchard, garden, and conservatory.
BUHACH is guaranteed to be as harmless to animal and plant life as it is destructive to that of the insects.
BUHACH is the powdered blossoms of a California grown flower and absolutely contains no acids or poisonous drugs of any description.
BUHACH is not to be classed with the thousands of worthless and dangerous preparations so called "Insect Exterminators."
BUHACH is the insecticide of progress.
Pure! Powerful! Potent!
BUHACH is not sold in bulk, but in sealed tins with yellow labels, upon which appears our Trade Mark BUHACH as above. Beware of base imitations. Ask your druggist or grocer for it and see that you get it. Descriptive circulars mailed free upon application to us. BUHACH PRODUCING & M'F'G CO.
of STOCKTON, CALIFORNIA,
49 Cedar St., New York.

For the Young.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

I STOPPED the game while it was loudest. It was getting far too rough, and I saw no reason why it should continue. The scholars took my interruption very much to heart. They appeared to think that it deprived them of one of the best portions of school life. There were many sullen mutterings and head-shakings as I broke up the circle.

The afternoon passed slowly away. An examination of the various classes developed some curious facts. Dozens of the scholars could tell the length of the Amazon River or the hight of the Rocky Mountains, but not one could name all the townships in the county or give the names of the counties immediately adjoining it. Several of the boys could spell through the spelling book with their eyes shut, but when it came to writing the words that rolled off their tongues so easily, they made the most ridiculous blunders. The best reader appeared to be the loudest shouter. Reading was purely a physical exercise. The same muscles were brought into play in shaking the sense out of the book that would be used in beating a human foe. Arithmetic appeared to be the favorite study. The scholars figured steadily at the "sums" in their well-worn books. As to the principles governing the "rules" which they repeated so glibly, they knew almost nothing. They were well satisfied that three multiplied by five necessitated the placing of 15 below the line as an answer. The book said so, and that settled it forever. Why or how this result was reached was another matter which had nothing to do with them. The educational system had been burned upon the altar of Bear Creek with the result of driving all the volatile elements into the air and leaving nothing but the ashes. These ashes must be planted again before a perfect growth could be secured.

I found that the last half hour had generally been devoted to spelling and writing. After a careful search I found but two writing books in the entire school; I found that there had never been more than six or seven. When I came to examine some of the writing I could well believe this.

When I called for the first class in spelling, two-thirds of the scholars rose and ran eagerly to form themselves in a long line at the side of the room. There was some little contest for the head, which I at last quieted by ranging the scholars according to size with the smallest at the head and the tallest boy at the foot. This arrangement did not give the most complete satisfaction for it brought my little friend of the morning to the head, where I found she was sure to remain, while it sent the dunce of the school to the foot, a position from which he found it impossible to extricate himself.

I was not long in discovering that much of the enthusiasm that clustered around Bear Creek education was bound into the spelling book. The dull faces grew bright with eagerness as the long words cut gashes in the long line of spellers and shuffled them about like the cards in a pack. Even the poor dunce at the bottom of the line flickered with hope when "triangle" gave him the chance of his life to go up five. But an evil-spirited "y" crept on to his tongue and spoiled his chances. There was a great deal of excitement about the spelling, but there seemed to be very little practical good. I determined to combine the writing and spelling by causing each scholar to write the lesson on the slate. I told them this without thinking that in so doing I struck at one of the cherished traditions of Bear Creek.

The effect of the days' skirmish was evident at night when I dismissed school. Several of the scholars, Mollie Brawn among them, packed up their books preparatory to taking them home. I supposed at first that this was done with a view to home study, but I was greatly disappointed. Mollie Brawn appeared as spokeswoman for the malcontents. She thrust her head in at the door and shouted:

"I can't learn nothin' frum no sech teacher as you be, an' I aint comin' agin. I'll tell my Pa too!"

After this explanation, she turned and ran with all her speed. The cover of the great dinner pail fell off, but she did not stop. I saw her at last far up the road, still running.

After the others had gone, Edith Bell, the little girl whose seat Mollie had usurped, came and tried to make me feel better over the desertion:

"I'll bring my sister tomorrow" she said. "Mamma will let her come, I know, when I tell her what a nice teacher we have this Winter."

As I was preparing to lock the door of the school-house, I noticed a little boy come cautiously out from behind the wood pile where he had been hiding. I recognized him at once. He had given his name as Johnny Billings. His clothes were ragged and seemed to have been cast off by a dozen different people before they fell to him. A great mass of almost white hair stood up straight all over his head. His cheeks were red, but his eyes were dull and grey. He looked as though some one had taken him by the head and pushed him down into his boots, and that when he came back to his old form the springs had broken and left him stunted.

This little fellow hurried up to me in great excitement. He caught hold of my coat in his eagerness, and his dull eyes looked up into mine, with an expression that I have seen on a dog's face before now.

"Say teacher," he asked earnestly, "when do Sunday come in the middle of the week?"

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I have been reading the letters from the Cousins in the RURAL ever since Pa has taken it. I would like to join the Y. H. C. if you will let me. I am 12 years old, and live on a farm of 160 acres, in Dakota Territory. We have lived in Dakota four years, and like it very well. I have seen two blizzards; they were not very bad. I have four brothers and two sisters. We have 13 head of cattle, four mules and 19 pigs. We planted the Garden Treasures but they did not do very well it was so dry. We had green peas and ripe strawberries June 12. We picked two bushels of gooseberries. We will have a few Snyder blackberries this Fall which were sent to us to try, and our black currant bushes were black with fruit. We have a fine grove of young trees on our homestead of many different kinds which are doing well with us so far. The melon seeds which you sent have done well. We have thrashed our flax but not the other grain, and our flax went 14 bushels to the acre. Although the drought was so bad our crops are extra good. A part of this letter was written in June.

WALTER THORNBER.

Iroquois, Kingsbury Co., Dak.

[You took a long vacation in writing this letter. Glad the blizzards were not very bad. I guess most of us would like to see a mild blizzard just to see how it looked.—U. M.]

UNCLE MARK: I wrote to you once before and my letter was put in the waste basket, but I was not discouraged. I would like to be one of the Cousins—may I join? Pa has taken the RURAL for almost 26 years; and I always enjoy reading the Cousins' letters. Pa gave me the Garden Treasures. I planted them and most all of them came up. Our Alaska peas were very nice. We live on a farm and have lots of cows, so of course we have lots of good milk to drink. We milked 18 cows this Summer, and sold our cream. We have horses too, about a dozen I guess. When it is muddy I ride a horse to school, and when I get there I let her loose and she comes home. Well I guess this letter is getting too long, so I will have to close for fear you will put it in the waste basket. From your niece,

Freeport, Ills. ANNA WEAVER.

[Yes, you are now a cousin. I guess you take good care of your horses, so they are glad to come back home. I like milk too.—U. M.]

DEAR UNCLE MARK: I promised to write and tell you about that hen that hatched one chicken and lost it. I set her on 11 Guinea eggs; she hatched four of them. The noise that the little Guineas made was so different from the chickens that she was afraid of them and would not brood them at all. Finally she went into a corner and died. Now, what do you think caused her death? I have a melon that weighs 11 pounds; 31 inches around lengthways, 25 inches around it in the middle. I have an ear of the Angel of Midnight Corn 11 inches long. It has eight rows, having 52 kernels in a row. Your nephew,

Kirkdale. JAMES STEVENS.

[Too bad about that hen, I'm sure. Perhaps her heart was broken to think her children had frightened her. I will enter the melon and corn for the prize.—U. M.]

DEAR UNCLE MARK: We planted the Johnson grass soon after we received it, but it did not come up till this Spring. Some was full eight feet high. We had pretty bad luck with the seeds, for the rabbits ate the peas, the horse relished the corn, the pigs made acquaintance with the muskmelon, the chickens thought it would be fine fun to scratch in the flower-bed, and the watermelons seemed to think that if nothing finished their business up they would themselves, and so they did, for there is not a melon bigger than a baby's head. We have some sweet potatoes that are just getting big enough to eat. We had one last year that weighed 3½ pounds. Hoping this will not reach the waste basket, I will close. Yours truly,

Chickamauga, Tenn. JOHN HOLM.

[I am glad some of the family enjoyed the seeds any way. Too bad you could not keep the animals out.—U. M.]

DEAR UNCLE MARK: I like to read the Cousins' letters. I have some flowers. I water my flowers every day. I have a little black dog; her name is Pearly. I have a kitten named Snowball and a pet horse and cow. I am a deaf and dumb girl 15 years of age. I have two sisters and one brother. I go to school at the Deaf and Dumb Institute at Fulton, Mo. It is a nice school with about 200 pupils. We have not had any rain here for about four weeks. We are not going to have much corn. From your friend,

Warrensburg, Mo. ELSIE LAMB.

[I am very glad you can take so much pleasure from the flowers. We have a great many things to be thankful for, after all, haven't we?—U. M.]

OUR parrot has become very tame indeed. I told you how he fought when we first caught him. He was savage enough for a time, but when he found that we did not want to hurt him, he began to feel better. By treating him gently and patiently we have him now so that he will stand on our hands and make himself at home anywhere. This shows what kind treatment will accomplish. If we had poked sticks at the parrot and plagued him, he would be savage even now.

WE had a little black-and-white kitten named Clover. It was a very bright little thing and we thought a great deal of it. It was just getting large enough to jump about and play. We have a big dog that is something like an old bachelor. He doesn't like children, whether they are human boys and girls, or little cats or dogs, or chickens. He is a very selfish dog; he wants his own dish and always feels angry if any animal comes near him while he is eating. Poor little Clover came running up to the house the other day, just as the dog was eating his breakfast. The little cat did not know what a selfish dog it was. She thought everybody was just as happy and full of play as she was. She went dancing up to the plate to see what the dog was eating, without thinking of stealing anything. The old rascal caught her by the neck, gave her one shake and threw her away, dead. We all felt pretty bad over that. The dog got a good whipping and was glad to run off and hide in the barn. He has lost some good friends by his cruelty. Now, you see what comes of being quick tempered and selfish. I have seen selfish children try to keep things away from their playmates. When the others come near they will sometimes strike at them. Suppose they should strike some friend in the eye and put the eye out. Such things have been done. Don't kick and bite or strike people. Dogs do that, and you are not willing to be called dogs I hope.

Scrofula

Probably no form of disease is so generally distributed among our whole population as scrofula. Almost every individual has the latent poison coursing his veins. The terrible sufferings endured by those afflicted with scrofulous sores cannot be understood by others, and their gratitude on finding a remedy that cures them, astonishes a well person. The wonderful power of

Hood's Sarsaparilla

in eradicating every form of Scrofula has been so clearly and fully demonstrated that it leaves no doubt that it is the greatest medical discovery of this generation. It is made by C. I. HOOD & CO., Lowell, Mass., and is sold by all druggists.

PERSONALS.

THE wealthiest woman in California is Mrs. Mark Hopkins, the widow of one of the four original founders of the Central Pacific Railroad. Her fortune is estimated at $40,000,000. She divides her time between San Francisco and Great Barrington, Massachusetts.

British peers and sons of peers hold salaried offices under the new Tory government to the amount of $550,000 annually. In addition, the Duchess of Bucclench gets $2,500 a year as Mistress of the Robes, and eight other peeresses $2,500 apiece as Ladies of the Bedchamber.

AUGUST BELMONT, the banker, is a short man with a withered leg. His favorite position when speaking to friends is to stand on his left foot, stroking his right thigh, as if it pained him. Mr. Belmont has a square-cut, florid, heavy face and English-cut side whiskers, well sprinkled with gray,

MR. GEORGE J. Gould is an expert telegraph operator. It took him five months to learn the business, and now he can understand a great many messages not intended for him. During the late strikes he found this accomplishment of much service, and was able to talk with his father, who was in Havana.

VISCOMTE DE LA MOTTE ROUGE, Inspector General of the National Stud of France, has been visiting Com. Colman, at Washington. He came to the United States by appointment of the Minister of Agriculture of France, at the request of the Commissioner, to act as judge at the great horse exhibition at Chicago.

IT is said that, notwithstanding Dr. Ward's advice that he fish and shoot industriously while in the woods, in order to reduce his flesh, President Cleveland took it easy, ate very heartily, took a nap each afternoon, and thus came out of the woods 10 pounds heavier than when he went in, and has never weighed so much as now.

NUMEROUS country papers report that through the efforts of Roscoe Conkling the heirs of the so-called Mercer estate are about to realize on their shadowy claims for $500,000,000 worth of property in Harlem. The Ex-Senator says he has never had any connection with or knowledge of the case. A fraud on the credulous somewhere.

WHEN Bob Taylor was first talked of for Governor of Tennessee there was some doubt whether he would accept, and a telegram was sent him to know positively. He returned the following answer: "A poor old man once dragged himself 20 miles to see my mother. When he got ready to leave he said: 'Madame, if you don't believe I can tote a ham home just try me!"

GEN. FRANCIS A. WALKER and John Boyle O'Reilly, Boston celebraties, but of sufficient note throughout the nation to come under the head of "people we talk about," are very much alike in appearance. Says one who knows them: "Both are stout and square in build, with faces of a dark Italian type and expressive eyes." O'Reilly, however, is nervous and of lighter frame.

SAID Fanny Kemble to a Massachusetts countryman whose trap she had hired during a vacation: "Sir, I have engaged you to drive me, not to talk to me." When the vacation was over she sent for his bill. Running her eyes down its columns she paused. "What is this item, sir?" said she, "I cannot understand it." And with equal gravity he rejoined: "Sass, $5. I don't often take it, but when I do I charge."

MR. ROBERT ADAMS, Jr., who recently introduced into the Pennsylvania Legislature a bill to provide corporal punishment for men who beat their wives, quotes Mr. Darwin to the effect that, with the exception of the seal, "man is the only animal in creation which maltreats its mate or female of its own kind," and declares that in Maryland, where a similar law was passed three years ago, the crime of wife-beating ceased as if by magic, after the first conviction.

THE undertaker who embalmed the body of General Grant has been trying to find somebody to pay his bill, but without success, and has finally brought suit for the amount—$500—against Mr. Arkell, the manager of the company that owns Mount McGregor, who gave him the order. On the publication of these not very creditable facts in the New York Sun, the editor of that paper adds a note that if the undertaker will send the bill to him he will remit the amount.

HOLSTEIN-FRIESIAN
CATTLE SALE
POSTPONED.

PLACE OF SALE CHANGED.

Owing to the excitement about pleuro-pneumonia at Chicago, the Auction Sale of Mr. F. G. BABCOCK'S Herd of HOLSTEIN FRIESIAN CATTLE has been abandoned at that point. The cattle will not be sent to Chicago, but are being forwarded from Kansas directly to New York, where they will be sold,

WEDNESDAY and THURSDAY, Oct. 20 and 21, 1886,

commencing each day at TEN o'clock, at the

American Horse Exchange
LIMITED,
BROADWAY and 50th Street, New York.

Persons who have received Catalogues and Lithographs of this Herd will please mark thereon the change of place and dates of sale above-mentioned, in order to avoid confusion.

Money Furnished to buy these Cattle.

While the terms of sale will be cash, the BANK OF HORNELLSVILLE, Hornellsville, N. Y., of which Mr. F. G. Babcock is President, will have a representative at the sale from whom responsible buyers desiring loans at two to six months, to apply towards their purchases, can secure the same at 6 per cent. per annum on their notes payable at Bank.
For Catalogues, etc., address
PETER C. KELLOGG & CO.,
107 John Street, New York.

850,000 GRAPE VINES
100 Varieties. Also Small Fruits. Quality unsurpassed. Warranted true. Very cheap.
3 sample vines mailed for 15c. Descriptive price list free. LEWIS ROESCH, Fredonia, N. Y.

EARHART EVERBEARING RASPBERRY.

STRONG plants were received from the introducers, Hale Brothers, South Glastonbury, Conn., Nov. 21, 1885. Our first note was made June 29, of this year. "First ripe berries. The bearing branches are wreathed with clusters. The laterals, from six to 12 inches long, bear from six to 10 medium-sized berries with a slight bloom. They are of good flavor and firm. The seeds are rather large. Canes thick and vigorous." Again, the following note appears in our records under date of Augnst 30: "Earhart bore its first crop with other medium-early caps. Many berries are ripening now, while others are quite green. Taking an average cluster, we count 30 berries all green."

The illustration, Fig. 394, was drawn from a cane cut Sept. 10. Most of the leaves were cut off so as to show the berries, several of which had dropped off, as shown. The berries continued to ripen until frost.

On September 1st, Hale Brothers sent us a box containing about 30 fruiting tips and longer stems. One six inches long bore 28 berries, all ripe. Six branches about one foot long bore respectively 29, 15, 21, 40, 35 and 25. One branch 15 inches long bore 69, half ripe, the rest green or red. The above may be considered an average of the 30 stems. On one stem with nine laterals there were 380 berries, one-third fully ripe, the others in various stages of development.

The productiveness of this variety is something remarkable. Even though it bore but a single crop, we should deem the Earhart a desirable variety, for its first crop was as large as that of ordinary kinds. When it is considered that it bears almost constantly during the entire season, and that the berries are in quality better than the Gregg and of fair size, we need only further to learn whether it will thrive as well generally as it has done here, with the Hale Bros. and in Illinois, to be satisfied that the Earhart is a valuable acquisition. That it is hardy and thrifty there is little doubt.

FROM THE REPORT OF THE FRUIT COMMITTEE R. I. STATE FAIR, SEPT. 23, 1886.

"An exhibit of fruiting canes of the Earhart Raspberry is worthy of special commendation. Single canes containing over 300 perfect berries are shown. Some of the berries are three-quarters of an inch and over in diameter and of as good quality as any black-cap. Other canes exhibited have buds, blossoms, green and ripe fruit, indicating that as an everbearing variety it is well worthy of consideration, and a special premium."

ITS HISTORY.

"Like many of our best fruits, the Earhart is a "chance seedling" found in the woods in Mason Co., Ill, about 1870, ripening its fruit in Oct., in such profusion as to attract attention. The original plant being removed to a family garden, and given good care for a year or two, proved to be an everbearing variety, producing its first or main crop with the other black-caps the last of June and early in July, while the new canes each season begin to bloom and bear fruit the last of July before the main crop is gone, and continue in fruiting till stopped by freezing in Fall. They bear not an occasional berry, but whole canes are thickly set with fruit.

My first knowledge of this berry was in 1884, when the editor of the R. N.-Y., handed me a letter he had received from Illinois regard to it, saying, "Here, Mr. Hale, it may pay to follow this matter up, for if half the story is true, it's the most remarkable new fruit yet produced." After some correspondence I was convinced of the honesty of the writer, and in June '85 visited Illinois to see the fruit, and there found one of the strongest-growing black-caps I had ever seen, carrying an abundant crop of fine, large fruit on the old canes. The strongest of the new canes were just beginning to bloom for the second crop, while the younger of the new canes were showing traces of buds, and three months later—Sept. 20th—rows eight rods long yielded 18 quarts of fruit at one picking, and had been fruiting continuously since June, and still had buds, bloom and green fruit that would ripen later. Early in May last, we planted out 600 plants on our farm here in Connecticut—tip plants with no wood on them, but plenty of good, strong roots. These made an early and rapid growth, and by the last of July began to bloom, and since August 15 there has at all times been an abundance of ripe fruit on nearly all these plants, many single canes producing over 100 perfect berries, while some plants have produced over 400 berries, many of them three-quarters of an inch cross-diameter. Early in July of this year I again went to Illinois and although the main crop had been about all picked there was some fruit left and some was ripening on the new wood. I counted 190 berries on one new cane, and a photograph of one taken September 16th shows 520 perfect berries. These qualities may not be of great value to the market gardener; but for the family fruit garden it is the most valuable novelty I have ever seen.—J. H. HALE."

THE EARHART EVERBEARING BLACK-CAP.
Drawn from a branch cut Sept. 10 at the Rural Grounds. Fig. 394.

* * *

MANURE *versus* FERTILIZER FOR POTATOES.

Our neighbor, Mr. A. J. Bogert, pretty nearly duplicated an experiment which we tried with potatoes last year. On one half of a measured acre he plowed under 11 tons of New York stable manure. On the other half 400 pounds of Mapes potato fertilizer were sown broadcast before planting, and 200 pounds were spread along the drills just before the first hoeing. The potatoes were planted in drills three feet apart and 15 inches apart in the drill. The manured half yielded 59 bushels of marketable potatoes and 11 bushels of small ones. The fertilized half-acre gave 78 bushels of marketable and 11 bushels of small potatoes.

* * *

PEAS PLANTED LATE.

OUR method of securing a succession of peas has been to plant, early in the season, the earliest, intermediate, late and latest varieties at about the same time, and in the order named so that the land could be cleared for later crops as the peas matured. Years ago we planted peas in July or August. They mildewed so badly that we rather hastily concluded that late-planted peas could not be made to pay. In a market sense perhaps this is true.

We were pursuaded to return to the experiment last August after a visit to C. A. Dana's island home in the Long Island Sound, where our contributor, Mr. William Falconer, the Superintendent, treated us to peas which seemed even more tender and delicious than those of early June. We planted a few rows of the Alaska Pea August 16. The vines, instead of growing to the length of three feet, as they did from April plantings, began to bloom when one foot high. The peas set freely and produced a very good crop by the first of October, the vines having remained quite free of mildew. The soil on either side of the young vines was mulched, the weather being dry, and two waterings were given afterwards. Two of the best peas picked are shown in our illustration Fig. 396, page 703.

The Alaska is a smooth pea, as our readers well know. Would it have been better to plant wrinkled peas—those of the thriftiest, bushiest growth, like Abundance or Everbearing? Or would the dwarf kinds, like American Wonder, or the half-dwarfs, like Stratagem, have been better?

The deliciousness of the Alaska when cooked will be borne in pleasant memory until another season, when we shall try the experiment again, though in order to escape early frosts, we shall plant from the 1st to the 5th of August instead of the 16th.

* * *

PRUNE D'AGEN. (?)

SEPTEMBER 4, we received from Mr. J. M. Ogle, of Puyallup, Wash. Ter., three plums which weighed 12¼ ounces. He calls it Gros D'Agen; says it is very common in the nurseries there and that many specimens will weigh four or more ounces. The tree he describes as a moderate grower, "requiring much cutting back to enable it to carry its immense load. As hardy as any one of our cultivated plums." He further says: "Its keeping qualities are good. I have a box now (Sept. 13) that are yet moderately firm, picked three weeks since and kept in an open room. They will readily bear shipment to New York."

With these large plums were others which he calls Petit d'Agen which were of the same color and quality as the others. This we have no doubt is the Prune d'Agen, but the large ones, a specimen of which is shown entire at Fig. 398 (page 705) and in half section at Fig. 397, we are in doubt about. The suture is small, the color reddish-purple. The flesh clings somewhat to the stone. The quality is superb, sweet, sugary, juicy and tender. We do not remember to have eaten finer plums.

Farm Topics.

CORRESPONDENTS' VIEWS.

DISCUSSIONS IN FARMERS' CLUBS ought to be the best part of the exercises. Sometimes they are interesting, but oftentimes they fail. Some farmers are no speakers, and do not like to talk. There are apt to be two or three loquacious members who are so fond of hearing themselves talk that they monopolize the whole time and disgust others who have good ideas to present. To make these discussions more interesting, we take a new plan which works well. The topic is announced a few weeks previous to the date of the discussion. An editor or compiler is appointed. He interviews the several members of the Club and gets their experience and opinions on the subject. These several opinions are written out in a condensed form with such mild comments as may suggest themseves, and are read as a whole. After the reading, short speeches can be given by those who wish to explain their views more fully. Many farmers who have valuable ideas are induced by this system to take part in the discussion. If they were obliged to speak their views they would remain silent. F. R. D.

Pittsfield, N. H.

LESS MEAT; MORE FRUIT AND VEGETABLES.—It has been said that it requires 15 acres to raise as much nutriment in meat as one acre will produce in fruits or vegetables. I consider that it requires more labor to sustain the animal creation than it would human beings without the aid of animals. Why not eat less meat and more fruit and vegetables? The old idea that we must eat just so much meat in order to live is all nonsense. Plenty of men keep fat and do good work who do not eat half a pound of meat per week.

Brandon, Vt. E. F. E.

GOOD USE OF A PREMIUM.—We propose to put the bell which we obtained as a premium for two subscribers for the RURAL on our school-house. This building, like those in many school districts, is used not only for school purposes, but for church and Sunday-school as well. The lack of a good bell has been a great inconvenience. The school board have always felt too poor to buy one, and there has always been a discussion between the church people and the school board as to which ought to buy the bell. If there are other districts like ours, this looks to me like an easy way out of the trouble. The ladies ought to be able to secure two subscribers in almost any district in this country.

Charlevoix Co., Mich. MRS. M. A.

A GOOD GRAVEL WALK, four feet wide—from my front door to the gate—a distance of 60 feet, was made as follows: I stretched a cord the whole length of each side of the walk to guide in digging. Large stones were placed along the borders of the walk, close together, so as to form continuous lines. The dirt was dug out of the place where the walk was intended to be built, and thrown over to the outside of the stones, thus holding them in place. The walk was then filled in with small stones with gravel on top of them. This was rounded off, leaving it a little higher at the middle, so as to shed water. The walk is built like a macadamized road on a small scale, and works finely. I did the work the latter part of August, when work was a little slack. A good walk is a great comfort. It is worth the extra work to get rid of tracking through the mud in Spring. A FRIEND.

GET A WAGON-JACK.—About the easiest tool to make is a wagon-jack, and yet I know farmers who never use one at all. Whenever they want to grease the wheels they hunt up an old rail and lift the wheel by main strength. A board under the rail will hold it up unless something tips it over, and, then, what harm does it do to have the axle drop into the dirt? The time and labor spent in running after the rail would count up were it not for the fact that such farmers never grease their wheels till they fairly yell out in agony. B. H. J.

Crawford Co., Pa.

A SNACK IN TIME.—Can we improve upon our present system of eating three meals per day? I claim that it never pays to let a person get very hungry A hired man will lose too much time in listening for the dinner bell. Talking about this to a friend last year, he said he always took a lunch when he went to a field far away from the house. Whenever he saw the hired man looking at the sun, he told him to go and get something to eat, either out of the basket, or, if near home, at the house. By eating a "piece" at intervals he never got very hungry, and kept up his work. There is more in this plan than people will see at first glance.

Ingham Co., Mich. J. M.

Field Crops.

THE BULLIFORM OR HYGROSCOPIC CELLS IN THE LEAVES OF GRASS.

DR. W. J. BEAL.

ON the upper surface of the leaves, running from base to apex of the blade, are rows of large, thin-walled cells which are really cells of the epidermis. They are very sensitive to changes of moisture and have been called hygroscopic cells. By the French they are called bulliform cells, as they often puff out like a blister. The rows of cells in each band is constant for any species, but varies from three to 12 or 15. These cells penetrate more deeply than the other cells of the surface, all of which are filled with water or air. The bulliform cells are different in different grasses. In Orchard Grass there is a single band above the mid-rib of the blade. When slightly dried, the bulliform cells contract, and as they run deeply into the leaf, the blade closes like the two leaves of an open book.

The leaves of June Grass have a band of bulliform cells near the mid-rid on each side. These when they dry cause the leaves to shut up or close in the same manner as those of Orchard Grass. The leaves of Timothy and Indian corn have several bands of bulliform cells all across them between the veins. These do not extend very far into the blade. When dry weather comes, the leaves roll up from each edge, as is observed when the leaves of corn "roll."

The leaves of Panicum plicatum, a grass cultivated for ornament, have bands of bulliform cells alternately above and below the blade. These contract when dry weather comes and the leaf closes in a zigzag manner like a fan. Other leaves have rows of bulliform cells differing from those mentioned.

The advantages to the leaf in closing or rolling are to protect the upper surface and so, to some extent, check the evaporation of moisture. If fastened open in dry weather a leaf will suffer more than when rolled up. A few leaves of grasses are absolutely indifferent and will not close on the approach of dry weather, while others roll up most of the time in all sorts of weather.

The leaves of most sedges (Cyperaceæ) grass-like plants, have single bands of bulliform cells above the mid-rib, which cause them to close in dry weather in the manner of Orchard Grass and June Grass.

Leaves of grasses are generally protected and strengthened by stout fibers which are just beneath the epidermis on one or both sides. One can form some notion of the extent of these fibers by the strength and the feeling of a leaf. In dry countries, the fibers are well developed.

There are many other interesting things to study in connection with the leaves of grasses, such as the different joints on the same plant, a comparison of the fibro-vascular bundles, a study of the old and the young leaves compared, a study of the tips of the leaves. Many experiments can be made to help to decide certain different points of structure and growth. There is none the less interest in the study of grasses, because many of them are useful, or because the order furnishes five-sixths of the money value of all the staple crops of the United States—and all this without considering the money value of our domestic animals. In speaking of matters of practical importance—of a money value—we are too apt to lose sight of the beauty that is in them. Those interested in this subject will find a more scientific and detailed account in the November number of the Botanical Gazette.

Ag'l Coll., Lansing, Mich.

The Herdsman.

CONTAGIOUS PLEURO-PNEUMONIA IN ILLINOIS.

Its introduction from Maryland; unsuspected ravages for months; retribution on the live stock dealers; authorities hampered by short-sighted parsimony; violence of the cattle owners; results of quarantining Illinois; risks of recklessly spreading the disease; precautions against shipping diseased dressed or canned beef.

IN the year 1883 pleuro-pneumonia was taken from Maryland to Ohio. The next year the plague was brought from Ohio to Illinois, and was thence sent into Missouri, Kentucky and possibly to Texas. After taking such measures as seemed to be in their power the Live Stock Commissioners declared that the malady had been eradicated in this State. It now seems to be more than probable that the disease has existed among the cattle of the northern part of Illinois ever since its presence here was first discovered in 1884. It is remembered that Mr. Clark, whose Jerseys were among the first cattle in Illinois to show the effects of the infection, said at the time when his herd was quarantined that a large number of cattle had been exposed to the infection by being brought into contact with his own stock before the nature of the disorder was suspected. The cattle thus exposed were scattered throughout the neighborhood, and no doubt that they conveyed the infection to other animals in scattered districts can be reasonably entertained. The wide publicity given at the time to information about the malady served to alarm owners of cattle, and at the same time it taught the unscrupulous among them to conceal the existence of the disease, and to hurry the ailing of their herds to market whenever such showed signs which led their owners to think that pleuro-pneumonia was the cause of their illness. There is no doubt that at the very time when the Illinois Live Stock Commission declared that this State was free from pleuro-pneumonia cases of that disease were concealed in the vicinity of Chicago. It is asserted by Dr. Rose that cattle have been dying in the Chicago distilleries during the whole of the last two years, of a disease like that which has created this alarm.

About the middle of September the announcement was made that pleuro-pneumonia had been discovered among the cattle in the northern part of Chicago. For some days the matter was kept from the knowledge of the public, those in the secret being unwilling to create a feeling of alarm before they could ascertain with certainty that this was the true bovine lung-plague. When there could be no longer a doubt upon this score it had also been learned that some 3,000 cattle had been exposed. Then began again the old, old fight between trade on one side, determined not to admit the truth, and science on the other hand, supported by the gathered knowledge of centuries of experience and loss, but unsupported by money or by effective laws. The stock-yard interest came forward, though unexpectedly, to urge that the most effective means known should be promptly adopted for the extinction of the disease; but the authorities are prevented from stamping out the plague, for, owing largely to the opposition offered by the very parties who are now most anxious to have all exposed cattle killed and sent to the rendering tanks, no sufficient appropriation for this purpose could be got from the last Illinois State Assembly. Opposition from the same sources had much to do with the refusal of the last Congress to appropriate enough money, and to give enough power to the Bureau of Animal Industry to enable that organization to act promptly and effectively. The veterinarians have therefore found that they are practically powerless so far as stamping out the malady is concerned. All they have been able to do in the case has been to prove that the disease is contagious pleuro-pneumonia, and by the aid of the General Government, to put a guard over the infected herds.

The present condition seems to be that, having learned what should be done in the case, the parties who should have power to act at once and effectively for the protection of the cattle interests of the whole country, find that they can do little or nothing to stay the course of the plague. Their position is an unpleasant one. By the stock-yard people and the packers and shippers of dressed beef they are urged to slaughter the exposed cattle and send all the carcases to the rendering tank. The local butchers want to get the beef of the cattle which may not show signs of the disease when slaughtered. The owners swear their stock shall not be killed before they are paid for, and have gone further than to threaten violence to the State and Government officials and the guard employed to prevent the removal of cattle or of infected articles. Last Friday one Irishman who owns two or three of the sick cows, and who has caused much trouble to the officials, attacked a watchman, and with the aid of half a dozen of his equally courageous countrymen succeeded in mauling the single guard unmercifully. The chief offender was arrested and will be fined, probably, for assault. One may well wish for the power of the effete monarchies for at least a long enough time to allow of dealing with this matter as it should be dealt with.

A report has come from Kankakee, a few miles south from Chicago, to the effect that contagious pleuro-pneumonia has appeared among some cattle taken to that place from Chicago. It is to be hoped that the outbreak will be found to be due to Texas fever. From Dakota a report came saying that pleuro-pneumonia had recently been taken there by stock from Chicago. The truth of that report, if it is true, has not been ascertained. Such statements indicate the existence of a feeling of fear which has found expression in declarations by a number of States and Territories of quarantine against cattle from Illinois. As most of the cattle taken to the West from the country east of the Mississippi pass through Illinois, the quarantine practically cuts off the movement of breeding stock from the East to the West. No one will, however, deny that simple prudence demands that such measures as will fully protect the cattle interests of the country should be at once adopted and maintained until proof shall have been given that cattle may be taken from the vicinity of Chicago without endangering herds with which they may come into contact. The statement that 160 of the quarantined cattle were last Sunday spirited away from under the very eyes of the guards placed over them by the State to prevent their removal, will scarcely tend to restore confidence among the cattlemen in the country. An assertion in one of the Chicago dailies, yesterday, to the effect that farmers and others continue to take cattle from Chicago to pasture and fatten on farms will alarm many. It is no more than fair, however, to say here distinctly, that as yet no evidence has come to light to prove that a single case of infection has been traced to the stock yards here.

Naturally enough, the shippers of dressed beef and the beef packers are somewhat alarmed about the effect the excitement may have upon people in the East, who do not know how the dressed beef and the canning business is conducted here. Those who are best acquainted with these two branches of the cattle business know that no crippled, bruised or diseased animal is ever knowingly bought by any of the larger firms. When, by some oversight, a beast that is not in good health is bought, it is condemned to the tank at once. No firm in good standing can afford to allow such an animal to go into its cans, or into its refrigerators. The loss from sending one or two, or as many thousands of cattle to the rendering tanks would be the merest bagatelle as compared with the injury that would be done to any business house if even so much as a single piece of glazed beef, or a can of spoiled meat should be discovered among its shipments. "E. VERO."

Chicago, Ill.

GUERNSEY HEIFER ENID 353.

THERE is no doubt that the Guernseys are steadily forcing their way by sheer merit into the dairy herds of this country and England. Their butter and milk are as rich as those of their rivals, the Jerseys, and the average yield of both is seldom less. They are larger, more robust, better foragers and able to withstand the inequalities of weather over a wider range of country. There are far fewer of them than of the Jerseys, both in their original homes and in the rest of the world; they have never been boomed, and no records have been widely published of enormous yields of milk or butter under forcing conditions. Probably the best thing that can be said in their praise is that wherever they are known they give entire satisfaction. A likeness of a fine specimen of the breed, re-engraved from the Live Stock Journal (London) is shown at Fig. 399, page 709. Enid is the property of Mr. G. Nevile Wyatt, Slough Place, Cuckfield, Sussex, and was winner of the first prize at the great annual show of the Royal Agricultural Society, at Norwich last July. There were 41 Guernseys, and as there was only one class for all sorts of Guernseys—that for Cows or Heifers in-milk or in-calf, calved in 1883—she must have been the finest specimen of the breed in the greatest cattle show in Europe.

DEVONS AGAINST JERSEYS.

BREEDERS are too modest in their praises of Devon cattle. In this rocky country they will beat any other breed when given ordinary farmer's care. There are many Jersey grades here which do well when housed and treated in first-class shape. The trouble is farmers who keep them won't always treat them as they need to be treated. On a cold, stormy day I have noticed the cattle in different barn-yards. Those with Jersey blood in them stand with rough coats, all humped up against the weather. The Devons are always bright and happy and ranging about for food. Our Devons always keep fat and hearty, and if there is anything to eat in a pasture they are sure to find it. A hillside pasture runs a Jersey down to skin and bones, but it has hard work to drive the ribs of a Devon into view. On common fare such as 90 per cent. of farmers give their cattle, I believe the Devon will beat the Jersey at both milk and butter.

Greene Co., N. Y. E. P.

JERSEYS AND ALDERNEYS; SELECTION OF A BULL.—Many farmers are hopelessly mixed as to the difference between Alderney and Jersey stock. The prevailing impression here seems to be that the cream-colored Jerseys are Alderneys. These are considered best for butter. A

grade Jersey bull, light in color, called an Alderney, is patronized while a bull of far better breeding, but darker, is neglected. In spite of all that has been said about fine stock, the use of thoroughbred bulls is far from extended. Good stock seems to range in localities. Somebody starts a herd in a township and the stock around him slowly improves. In the wide stretch of country that lies outside these places, it is hard work to get farmers to see that a blooded bull is any better than a grade. If they raise their own calves they seem to think that a calf from a good cow will be sure to turn out well, no matter what the bull may be. Too many of our bulls are simply overgrown calves. They are put to service as early as possible and are to be slaughtered at three years old. This system hurts the dairy business. V. H. S.

Bergen Co., N. J.

R. N.-Y.—There is no difference in this country between what are known as Alderneys and Jerseys. Both terms are applied to cattle from the Island of Jersey and their descendants. It is probable there are not 50 real Alderneys in the whole country; and whatever number there may be, they have doubtless been imported as *Guernseys*. Alderney is a little bit of an island with an area of about four square miles, a part of which is too rough for grazing purposes. Potatoes are the chief articles of export, and wheat is also largely grown. Not much land is, therefore, available for grazing purposes, and not many cattle have ever been raised there. Alderney Island is a part of the Bailiwick of its much larger neighbor, Guernsey, and Alderney cattle closely resemble the Guernseys, with which they compete at the cattle shows in Guernsey. They have no herd book of their own, but are registered in an appendix to the Guernsey herd book. St. Anne, the port of Alderney, is 20 miles northwest from St. Peter Port, Guernsey, and 45 miles due north from St. Heliers, Jersey, and nearly those distances nearer to England than either. It was, therefore, generally the last port at which vessels trading with the Channel Islands called, and the cattle they had on board when they reached England, whether originally shipped from Guernsey, Jersey, or the adjacent French ports, were all called Alderneys. The Jerseys were then, as they are still, by far the most numerous; hence in time the name Alderney was applied to animals of this breed exclusively, which are somewhat smaller, less robust, and more refined than either the Guernsey or real Alderney cattle.

The relative influence of the sire and dam upon the progeny, either for the dairy or the shambles, is a matter not altogether beyond dispute; but all agree, in a general way, that half the value of the calf comes from the sire, and in turn his excellence comes almost entirely from his parents. The great advantage a pure-bred bull has over a "scrub," grade, or cross-bred animal, is that he is far more likely to transmit to his progeny all or most of the characteristics of his breed, and the longer the breed to which he belongs has been established, the greater his prepotency, or power of transmitting these characteristics. The offspring of a "scrub" bull may resemble either of the parents, or hark back to some remote ancestor, or partake of some of the traits of several ancestors, or be different from either so far as recognizable. Neither in form, color, fattening nor milking qualities can any definite results be reasonably expected. The same is true with regard to cross-bred and grade bulls to a great extent. In all these cases no definite result can be foretold with regard to the progeny of any sire, however well formed and excellent the animal may be himself; whereas when a pure-bred sire is used we may always expect to see in the progeny many characteristics of the breed to which their sire belongs.

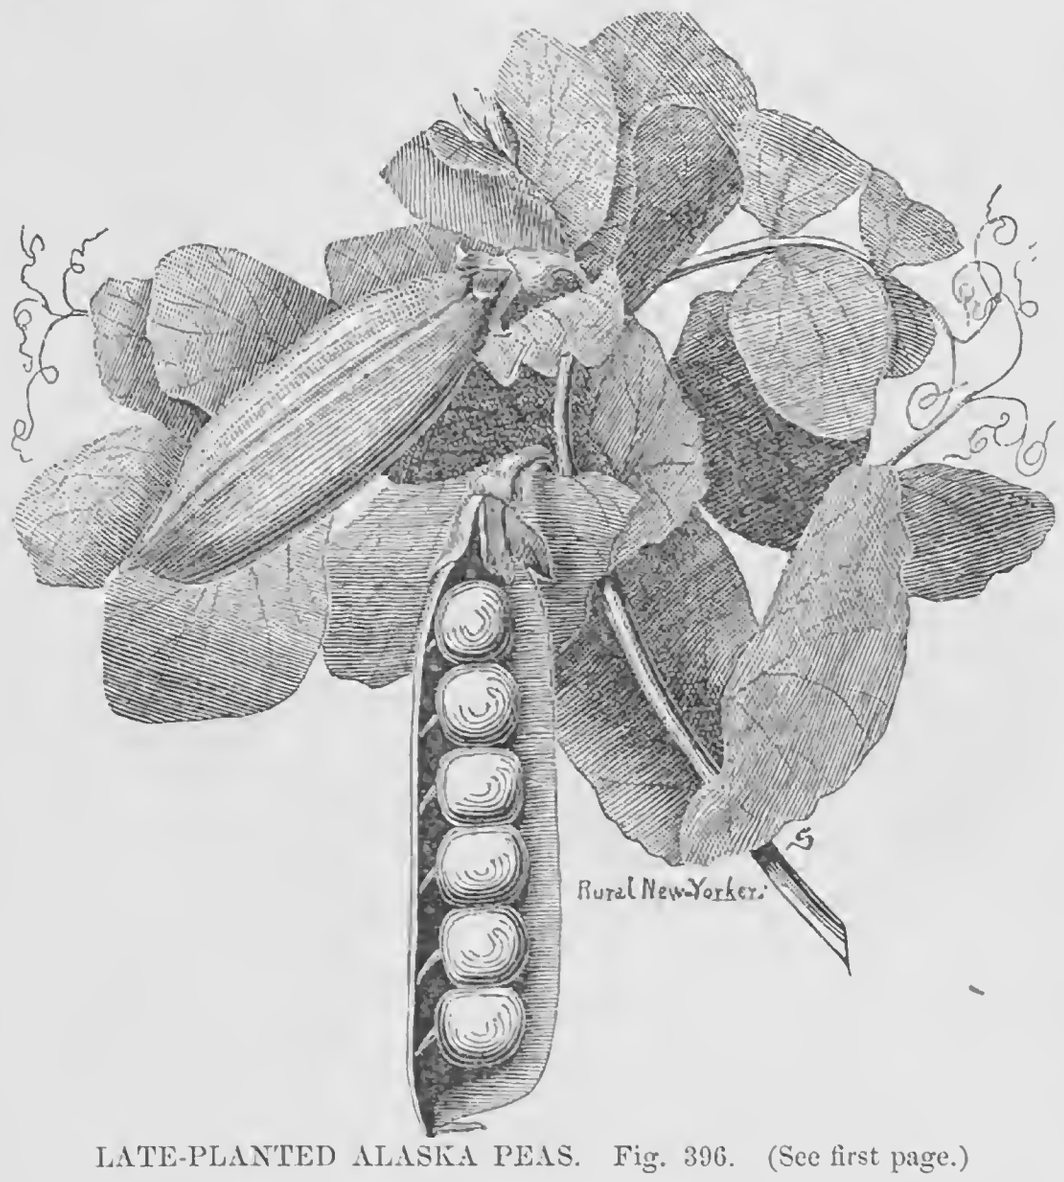
The characteristic colors of the Jersey are mostly light red or fawn, and black mixed and splashed with white, and solid colors with black points are preferred as indicative of the most careful breeding. So long as sire or dam adheres to the characteristic colors of the race, however, a preference for breeding purposes should depend on other considerations—on the bull's side, on his escutcheon (for a good escutcheon in a bull is as important as in a cow), on the milking capacity of his dam, granddam, and other female ancestors, on the performances of his previous progeny, on his temper, his freedom from faults, and his general appearance. If one wants "solid colors," or any other special feature, and can get them with plenty of milk, well and good; but the sensible breeder will look to more important points than color in selecting a bull to breed from.

THE LITTLE BRITTANY CATTLE are now attracting some little attention in the Gulf States and in New England. They are in size between a goat and a Jersey heifer. They have been well termed "Jerseys boiled down." Their milk is rich and the butter excellent. They can make a living where larger cattle would starve. It is claimed that they can produce more milk and butter from a given amount of feed than any other breed of cattle. There is a good place for them on rough hilly farms where with larger cattle a good share of the feed is consumed in providing motive power with which to hunt for more. Several Brittany cows kept in a herd of common cattle will improve the quality of the butter.

HEREFORD ON AYRSHIRE.—A noted Hereford breeder is trying, as a side issue, a cross of a Hereford bull on an Ayrshire cow. The cows from this cross are strongly marked with the Hereford marks, but are good dairy animals. It is generally considered best in crossing breeds, to use a male of the smaller breed.

AGAINST POLLS.—The arguments advanced against polled cattle are that a hornless head is but poorly confined in the ordinary stanchion, that a polled cow can get her head between rails and work them out of place, and that the lack of horns gives the herder overconfidence. He places too much reliance upon the supposed gentleness of his animals until he is crushed or pounded with the blunt head. The blow from a horn is like that from a spear. The blow from a polled head is like that from a sledge-hammer.

ECONOMY ON THE RANCHES.—The Montana Stock Growers' Association decide that no free meals shall be given on the ranches and that a list of all visitors shall be kept. Many cowboys make it a point to spend the Winter in visiting. They ride from one ranch to another getting their meals free. The rule will tak



LATE-PLANTED ALASKA PEAS. Fig. 396. (See first page.)

care of these fellows, but it is a poor one in that it prevents hospitality to those who are honest and deserving.

Horseman.

NECESSARY ATTENTIONS TO THE HORSE.

THE owner and driver have control over the sundry little things that appertain to their own personal comfort, but the poor horse that hauls the load and the driver both over good roads and bad, controls nothing. He is forced to pull a heavy load against a badly fitting collar, a galled shoulder, or with a check rein so tight that he is unable to get down to a comfortable and effective pull. It is the little things, not singly, but combined, that give the horse discomfort—the galled shoulder; the collar that in part cuts off the wind in ascending a hill; going up hill with head checked up taut; too tight a belly-band, cutting short the full expansion of the lungs. The direction of the draft is too high for a slanting shoulder, or too low for one that is upright. The shoes are too smooth for slippery roads, thus preventing the possibility of planting the feet firmly for a steady pull. In such a case, the fore feet slip to the right and the left, and the hind feet, one at a time, slip backward with a crack, in some cases giving a fearful strain to the leg and loin. Yet, in such a case, many a driver will give the horse a sharp cut with the whip for permitting a momentary check in the movement of the load.

Horses are made to pull heavy loads, and make speed over hard pavements or frozen ground when the feet are tender, no allowance being made for the discomfort to the beast. Many horses that perform hard labor, and do this from day to day on moderate feed, are hurried over the road or made to draw loads beyond their strength. To deny a frequent breathing spell is one of the many inhumanities put upon the horse. This denial of a brief, needed rest causes many a horse to become balky. A person ignorant of the horse's peculiarities and capabilities, buys a horse when thin in flesh and correspondingly weak, and being ignorant as to the real effect of this upon the animal's ability to pull a load, overloads; the horse stops with a wheel deep down in a rut, or at the foot of a hill—why? Not because he is, or ever has been, other than a willing horse, but because he is asked to do what his strength is not equal to, and he does the most natural thing for him to do under the circumstances, the only thing, in fact, left for him to do, namely, to *stop*. The new owner denounces him as a confirmed balker, and straightway resorts to the whip.

The man who has had experience with horses, can, at a glance at the countenance of a poorly fed and over-worked animal, pass upon his ability, or rather want of ability, to perform labor as readily as a medical expert would pass upon the condition of a pale, ill-nourished, over-worked shop girl, such as we meet mornings and evenings on the street cars of a crowded city; and the truism that you cannot expect something from nothing, applies to both these cases. After having bought a strange horse, if after putting him into use, it is discovered that he seems not to be equal to the work you put upon him, it is possible to show him favor by giving him the best of the road. The average driver permits his team to follow the beaten track, regardless of mud and ruts; and now and then a wheel drops into a rut hub-deep, giving the team a violent check back, and requiring the utmost effort to gain solid ground. By looking ahead, keeping the team "well in hand," as all competent drivers do, the best ground can be selected for the load to pass over. In making a stop to give a horse a little respite, a prudent driver will always come to a halt upon firm ground, and if practicable upon decending ground, thus insuring an easy start. Upon macadamized roads, where hills are cut through, and there are no ruts or soft places to shun, success hinges upon having strong legs and feet, and good wind, and so managing as to preserve these intact. "WESTERNER."

FEW PERCHERONS IN ENGLAND.—English papers do not like the statement recently made, that many Percheron horses have been carried into England. The Live Stock Journal says it would be hard to find a single Percheron stallion in the whole of England. With Shire, Clydesdale and Suffolk horses the English do not care for Percherons.

ILL-TEMPERED STALLIONS.—The editor of the English Suffolk Stud-book tells the truth about stallions. An ugly horse is set down for his true disposition. There are many otherwise splendid horses that are very fiends in temper. It is more than an even chance that this temper will be stamped upon their offspring, and thus fill sections with stubborn, brutal horses. Is it honest to sell colts from such stallions without speaking of the defect?

Dairy Husbandry.

DAIRY NOTE

T. D. CURTIS.

HOW MUCH PER 1000 POUNDS LIVE WEIGHT?

THE question has long been asked, How much per cow? More recently the question has been raised, How much per acre? The quantity of food consumed has also been agitated as a legitimate topic to be considered. This is closely allied to the question, How much product per 1000 pounds live weight? This is a proper question for experiment and record. The ration for each 1,000 pounds of live weight being tolerably well settled, the other question of amount of product from 100 pounds of live weight naturally follows, and the two combined must give us a closely approximative key to the value of the cow for dairy purposes. If the size of the cow and the amount of the ration are left out, we can form little idea of the value of the cow from the number of pounds of milk yielded, the quality of which is not given, or from the amount of the butter product, the cost of which is not known.

FALL SHELTER.

This is the season of the year when it is in order to remind dairymen of the suffering that comes to cows and other stock from exposure to the cold rains and the frosts that follow the hot season and precede the cold. The sudden falls of temperature often chill animals, as they do men, to the very marrow; but the animals have no overcoats to put on, and must bear the cold in their summer dresses. By these chills they contract colds and incur suffering from lung troubles and and rheumatism, the same as human beings do when thus exposed—for animal flesh and blood are the same in both cases, and are similarly affected by undue exposure to sudden changes of temperature. Cows in milk will attest their suffering by the shrinkage in the flow of milk. This shrinkage can never be fully regained, even though the cow may remain in apparent good health and the set-back caused by chilling will so affect the general health that the bad effects will continue for weeks if not months, and so far disqualify the animal for resisting the rigors of Winter. The best of health and condition should precede the going into winter-quarters. It pays the farmer, therefore, to provide good fall shelter for his stock, and to see that all animals have access to it at least as often as they naturally seek it.

VARIATIONS IN CREAM MEASURE.

That there is a marked variation in the quality of cream is a comparatively modern discovery, the cream of some milk being twice as valuable for butter making purposes as that of some other. And cream behaves differently under the same conditions. The amount of shrinkage or condensation, by standing after being raised, varies materially. For instance, at the Minnesota State Fair, the past season, in testing the milk of eight Jerseys, seven Holstein-Friesians, and one grade, by the cream gauge and test churn, the per cent. of cream was noted at the end of 12 hours, and again at the end of 12 hours more. It was found at the end of the last 12 hours that five of the Jerseys had increased the measure of cream and three had decreased it, while three of the Holstein-Friesians had increased the measure, three had decreased, and one remained the same. The cream in the grade-milk was increased. Now, why this difference, under precisely the same conditions, if it is not in some way owing to the quality of the cream? And the quality must be peculiar to each individual cow, for the cows were all blooded animals, and doubtless well kept, so that the difference in quality could not be attributed to difference in keep.

OLEO LAWS AND BUTTER PRICES.

SOME weeks since the RURAL published what it called a black list of Congressmen who voted against the Oleomargarine Bill. We were advised to show our disapproval of their course by refusing to vote for them again in case we ever got a chance. The farmers of the country seemed to consider it good, sound advice. Now, will they come right up to the mark and make their words good? Over here in New Jersey we are told that at least two of these black-listed Congressmen are again running for office. We have one Republican and

one Democrat that I know of. I shall vote against one of them anyway, and would vote against both of them if I lived in the district where my vote would reach the Congressman. I claim that the farmers of New Jersey have a chance now to show just where they stand. We sent in loads of petitions, now let us stand up like men and show what there was back of these petitions. If we fail to do it we might just as well keep our mouths shut in the future, for no House of Representatives will have respect for men who talk one way and vote another. We ought to rule this country, so everybody says, but we never can rule it by signing petitions. We have got to back up our talk with our votes. I don't believe there is a question that can be reached at the present State election of more vital importance to the farmers of New Jersey than this one of honest butter. It may be that we cannot send up the price of butter by defeating these men, but we can, at least, stop them from injuring us further, and add more dignity to the farmers' vote. C. W.

Passaic Co., N. J.

[There has been some little inquiry concerning the state of the New York butter market as compared with previous years. The following figures show the range of prices. The first row of figures gives the prices for the best creamery butter, and the next row prices for best dairy. These are taken from our market reports for the last five years. August and October are taken as sample months:

	CREAMERY.		DAIRY.	
	Aug.	Oct.	Aug.	Oct.
1882.....	25	31	24	29
1883.....	22	29	21	25
1884.....	22	29	19	23
1885.....	19	21	16	19
1886.....	20	32	17	26

These figures show that good butter is quoted in this market at a higher figure than at any time since 1882. Creamery butter is 11 cents higher than last year, while best dairy is seven cents higher. Since August the price has increased 12 cents on creamery butter and nine cents on dairy. Last year the increase, in the same time, was but two cents on creamery and three cents on dairy. The greatest increase known in the same time before this was in 1884, viz. seven cents on creamery and five cents on dairy. How much of this increase was due to the "oleo" law may be imagined when we consider that other articles of produce have advanced little if any. In 1880 New Jersey produced 9,513,835 pounds of butter. Figuring this, even at one-half the advance in price of the past few months, an idea can be gained of the importance of the oleomargarine law.—EDS.]

DAIRY CONTESTS AT FAIRS.—How much do the milk and butter contests at the fairs prove? That one breed is superior to another or that one breeder is more enterprising than another and can put a better cow into the field? It is too often more of a contest between feeders than between breeds. What the great public want to know is how to get the most milk and butter out of a certain amount of food. If one cow gives more butter than another, all right, but how much more meal or bran does it take to do it?

EXAMINE THE TEETH.—I notice that whenever a good dairyman wants to buy a cow he looks at her teeth. The udder, stomach and chest are all looked at, but the mouth comes in for a careful examination. That seems like good sense when you come to think about it. After all, it is the food that makes the milk and butter rather than the stomach and udder. One is the power and the others are the machines. A cow must have good teeth to take care of her food. Before I bought a dairy cow I should want to see her eat.

Ontario, Can. H. G. BROWN.

Sheep Husbandry.

Notes from the Western New York Farm.

FEEDING LAMBS.

WILL THE MANURE ALONE PAY?

THIS is the all-important inquiry in a long letter from a friend in Ohio, and it is one that equally interests every farmer of this country, especially such as desire to improve their farms and are not satisfied with the meager crops that barely pay the cost of cultivation. The vast majority of farms in all the older States are on the decline, and despite the better tillage are annually yielding less and less, and the area to which this rule will apply is extending rapidly westward. In localities where a score of years ago, the manure was considered a nuisance and was dumped into some ravine to be washed away by the Spring freshet, and where it was claimed that the fertility of the soil was so abundant that it could not be exhausted in a century of continuous cropping, men are now carefully saving all the manure made, and anxiously inquiring how the supply can be increased.

Farmers are becoming fully conscious of the fact that the soil is not a laboratory in which fertility is made, but merely the granary in which it is stored, and unless the supply is in some way replenished it must eventually become reduced beyond the point when paying crops can be grown, and the wisest cultivator is he who so manages his soil as to return a full equivalent for what is taken away as long as he can before this point is reached. Even the farmers on the rich prairies of the West cannot be too careful in returning to their fields every pound of waste material containing plant food. Of course, the elements of fertility can be obtained in bone dust and other sources of phosphoric acid; in potash salts; in oil meals, gluten meals, cotton-seed meals and other sources of nitrogen, and in many parts of the country it will pay richly to buy and use one or more of these things singly or combined in the various commercial fertilizers; but no one should use these to the neglect of all the barn manure he can make. Millions of pounds of oil meal, cotton-seed meal, gluten meal, bran and other foods rich in nitrogen, potash and phosphoric acid, the by-products of our manufactories are shipped across our starving fields and exported to the Old World, there to be fed and the residue used to enrich their fields. Every pound of this should be fed at home, and the manure used to restore and maintain the productiveness of our acres.

It is a beneficent provision that these so called waste products retain very nearly all the plant food contained in the whole grain, and that when fed to fattening animals very little is taken from them beyond such as come mainly from the atmosphere, so that were our farmers to provide suitable quarters and feed all these foods, together with other suitable foods, the exhaustion of our lands would be almost unappreciable.

Now, in answer to the question: Suppose a

R. N-Y

GROS D'AGEN PLUM. Fig. 397. See 1st page.

car-load (200) of lambs are put in to feed, and the quarters are of the best, and the animals are so cared for that the gain in price and weight will be sufficient to pay for the food consumed, and no more, what would the feeder have in the Spring to pay for the labor and profit on the investment? He will have fed of clover hay, or its equivalent, 30 tons; of corn, nine tons; of bran, four-and-one-half tons, and of oil meal, the same. Conceding that he must have the plant food contained in these foods, and that unless they are put upon his soil in this manner, he would be compelled to purchase them in the cheapest form to be found, it would cost him at least $240 to buy what would be contained in the hay; $54 for that in the corn; $49 for that in the bran, and $72 for that in the oil meal, or an aggregate of $415. This calculation is based on the very lowest valuation of grain by any chemist of the plant foods contained in these various foods; but suppose that one-half is wasted and lost (a thing which would be inexcusable), there would still be a profit of over one dollar per lamb. Surely the *manure alone will pay.*

* * *

Those breeding early lambs, and who have had rams and ewes together for the past two months, should have separated them the first week in October, unless perchance lambs are wanted after March. And after they have been taken away the rams should be put into extra good feed and grained a little every day, in which case they will be ready to use again in November for raising lambs for the next Winter's feeding.

A recent steamer brought from New Zealand to London 11,410 carcasses of mutton, averaging 65 pounds apiece; 523 legs, averaging eight pounds apiece, and 225 haunches averaging 24 pounds apiece, besides 75 quarters of beef averaging 200 pounds each, and 56 cases containing 2,520 dozen kidneys which brought 48 cents a dozen.

The Swineherd.

BERKSHIRE SWINE.

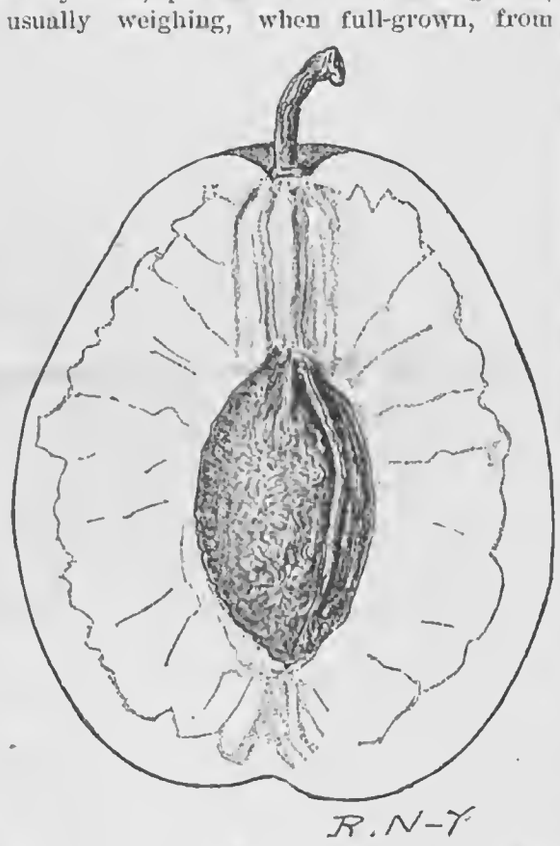
A. B. ALLEN.

Prepotency of Berkshires; antiquity of the breed; superiority for hams and bacon; origin of the Improved Berkshires; excellence of these; their early maturity; the American Berkshire Association, and Record; caution in buying; number recorded; points; as graziers; best feed; their popularity.

THIS is the most ancient improved breed known, which, with its other superior qualities, raises its value to the highest pitch; for the longer any breed of animals has been in existence, the greater the certainty of stamping its qualities in all their integrity upon its offspring. For crossing on other breeds less ancient, improvement is also more certain and rapid. When Berkshire boars are put to strange sows, there is not one of the resulting litter which will not prove superior to the dam, while several of the pigs almost invariably so closely resemble their sires in color and all desirable points, as to be taken by those not perfectly familiar with true Berkshires, for them.

The time of the commencement of the improvement in Berkshire swine is not known. When visiting England in the Summer of 1841, for the purpose of obtaining some foreign importation into the State of New York, to recruit my piggery there, I was informed by the most aged breeders that they had known Berkshires from the year 1780, in as great perfection as the best then existing in England.

Originally the Berkshires were a buff and sandy color, spotted with black; of large size, usually weighing, when full-grown, from



R. N-Y

GROS D'AGEN PLUM. Fig. 398. See 1st page.

about 800 to 900 pounds, and coarse in all their points. But notwithstanding this, their flesh was quite superior at that time to that of all other British swine for hams and bacon, in consequence of a greater predominance of lean to fat, so well streaked—or marbled, as it is termed—as to render it tender, juicy, and highly savory.

When English farmers began to grow more enlightened as to the best sorts of their domestic animals, they saw that these swine were too slow feeders for a good profit, as they did not mature and could not be properly fattened till they had attained the age of about 2½ years. Looking about them to see how they could be improved, particularly in this respect, a recent importation of Siamese stock struck them as most likely to do this, by crossing the males on the native females, which being done, and their produce bred together, they formed what has since been called the Improved Berkshire swine.

The Siamese were scarcely half the size of the native sort, but possessed a thick, round, deep body, with extra well-developed backhams and shoulders, a fine head, dished face, short, prick ears, and small legs and feet; it will be seen that it was admirably suited by crossing to make a rapid improvement in the form and earlier maturity of this large, coarse stock, without lessening its hardiness, thrift and good constitution. The color of the Siamese was from dark slate to a rich plum, with two or more white feet, and a white tuft at the end of the tail. This color and markings were generally imparted immediately to the cross progeny, as well as all other desirable qualities, making them, down to their present descendants, the best fleshed and most profitable swine to breed and rear that the world has yet known.

Those of the present day can be grown to weigh 300 to 350 pounds when 12 months old, 500 to 600 pounds at 18 months, beyond which time it is not generally profitable to keep them for slaughter. They can be easily well fattened at any earlier desired age, and always turn out a first quality of flesh, eagerly sought for at an extra price in all our markets. Being very hardy, thrifty and active, the present stock are found quite superior for crossing on different breeds with a view to improve their flesh for hams and bacon, while no others can in this respect improve them.

For the purpose of keeping the breed strictly pure, and to guard purchasers from being imposed upon by unprincipled men in selling them grade stock for full-bred, a large assembly of breeders met February 25, 1875 at Springfield, Illinois, and organized the American Berkshire Association, electing a President, Vice-president, Secretary, Treasurer and an Executive Committee of six persons. Soon after this the Association commenced the publication of the American Berkshire Record, for the purpose of recording the pedigrees of all such as the owners desired to enter, and which could be proved to be pure stock. The same thing was done in Great Britain in 1884, and the two Associations have had an elevating effect, and put an end almost entirely to the nefarious sales of grade animals for full-bred. When people wish to purchase now, they enquire as to the pedigree of the pigs offered for sale, and then refer to the published Record, and if the two correspond, the bargain is completed. Eight volumes of this have already been published, the first of which was issued in May, 1876. These recorded 11,518 head, and since this up to October 1, 1886, the additional number of 1,996 have been received for record in volume ninth. The aggregate now is 13,514, of which 4,626 are males and 8,888 are females.

At page 16, volume third, of the American Berkshire Record this improved breed of swine is officially described as follows:

"Body color, black, with smooth, pliable, plum-colored skin; hair rather fine, soft and thick; feet and tip of tail white, with dash of white in face, and not unfrequently the nose white, as also some white on jowl; forehead and face broad, the latter dishes, with eyes rather large and very clear, and snout short; ears of medium size, thin, and very soft, and carried rather upright; neck short, broad on top, with jowl large and full; shoulders broad on top, and deep through the chest; back broad; sides deep, and nearly straight on bottom line; hams large, reaching well forward on back and well down on hock, well rounded, and deep through, causing the legs to stand well apart, these as well as the forelegs, short and strong, and standing well on the toes; tail tapering and rather fine and set well up. In general form, a modern, well bred Berkshire, in good condition, is symmetrical throughout, attractive in appearance, and recognized at once as an animal of more than ordinary merit."

Lean, tender, juicy flesh predominates in the carcass of the improved Berkshire swine. This makes their hams and shoulders quite superior to those of all other breeds for smoking, and the side pieces for bacon. The meat is well defined as being fine-grained, rich, savory and nicely marbled. Possessing high vital powers the Berkshire is hardy, active, thrifty, and less liable to be attacked by prevailing diseases than most swine. Being good graziers, when nearly full-grown and subsequently, they thrive well in an abundant grass or clover pasture during Summer, and on vegetables in Autumn. Pigs of course should have some grain. When they come to be fattened, pure corn is not the best feed for them; it should be mixed from one-third to one-half with oats, barley, rye or buckwheat, the four latter grains probably in the order named. Peas are also an excellent mixture. All five of these have a tendency to make tender lean, instead of fat meat, while corn alone is too gross. The grain ought to be ground, for otherwise much of it will pass through the swine undigested, and be a great waste. Add to the above a pint to a quart of oil meal per day, and a few vegetables should also be fed with the provender, for with these all animals fatten faster and better than without them.

With so many excellent qualities, and such care taken in their breeding, Berkshires are multiplying more rapidly over the whole civilized world than any other sort of which we get an account. A knowledge of this is an important incentive to an increase in their careful raising, for the profit in doing this is highly promising. They are in great vogue now, and nothing can supplant the demand for their particular quality. Other breeds are preferable to make fat pork for salting and barreling; but for hams and bacon, the Berkshires excel in an eminent degree.

Farm Economy.

PORTABLE SILO.

AN illustration is given at Fig. 395 (p. 705) of an English arrangement for handling silage. A

portable silo with a foundation of concrete, wooden walls, and a corrugated iron top is coming into use quite extensively. Of late a system of packing the silage by means of a heavy roller has received considerable attention. This roller is shown at work in the cut.

It may be rolled to and fro simply by hand. For convenience and economy it is made hollow and filled with water or sand, or the roller may be solid or otherwise formed and weighted. Though primarily for use in the silo, the roller may be used for open stacks, with the addition of a few upright posts and boards at the sides, which can be afterwards removed when the pressing is finished. The roller, as shown in the sketch, is traversed back and forward over boards laid on the top of the grass. It should be noted that sand, where conveniently obtained, gives nearly double the weight of water ballast, without adding to the cost of roller.

This rolling process was first used in 1884, when with three of the rollers in use 1,000 tons of silage were packed. The rollers were also used in packing down stacks. The rollers give an even and continuous pressure far better than that of treading.

Indust'l Societies.

AMERICAN HORTICULTURAL SOCIETY AT CLEVELAND.

(RURAL SPECIAL REPORT CONTINUED.)

More about the Lucretia Dewberry; perfect fruit only wanted at shows; California for the next convention is 1888; the new Bureau of Pomology, and its proposed scope; the press and horticulture.

CONTINUING the small fruit discussion at the second evening session, Mr. Albaugh, speaking of the Lucretia Dewberry, said: "The original plant is now nine years old. My brother at Covington, Ohio, was the disseminator. I have seen its distribution attributed to E. Y. Teas. It came originally from Virginia, having been brought to Miami County by a soldier. The Lucretia ripens about with the Gregg Raspberry. It is larger than any blackberry I know of; vine probably about as hardy as the Taylor." Mr. Caywood; "The Lucretia, I think, is a wonder, a magnificent berry, almost a week before the standard varieties. It is a whole week ahead of our Minnewaski; being very large. We have an acre of it for market, planted four feet apart. We tie the upright canes to a stake, then let them trail over the ground near the stake." Mr. Crawford: "It is as good as it ever was claimed to be. The vines grow very long, eight feet at times; roots from the tips, but will also grow from root cuttings." Mr. Albaugh said his brother raised about 100 bushels of the Lucretia this year, which he sold at 18 cents a quart.

On assembling Thursday morning the various awarding committees reported. Mr. Vandeman said his committee (on apples) had acted upon the principle that when the only specimen shown was imperfect and defective, no first premium should be given. He thought perfect fruit only was wanted at these exhibitions. President Earle heartily sustained this position, and the members all voted aye. (Let every fruit committee in the land adopt this much needed reform inflexibly.) It was recommended by the committee that some place in California should be chosen for the next meeting of the society, the time being fixed in February, 1888, and the point to be located by the Executive Committee. At least some place on the Pacific coast was strongly urged, depending in some degree upon the adjustment of rates with the railway companies. President Earle read a letter from President Hilgard, of the California State Society, inviting them to meet there in 1888. Some of the members seemed a little startled at first. The broad scope of their association began to dawn upon them more fully. Many were calculating the cost to see if it came within their individual possibilities. Mr. Earle strongly urged the proposition, and no one seemed to oppose it. The matter was finally left to the Executive Committee to decide.

A paper was then read by H. E. Vandeman on "Pomology as a Division of the Agricultural Department at Washington." He enjoys the title and position of "U. S. Pomologist" under the new law; the first Pomologist created by the Government. Many members were wholly ignorant of any such Division, and few knew the law had passed, among them Pres. Earle. So Mr. Vandeman's paper really contained some surprising information pleasing to all. The appropriation of only $3,000 in addition to his salary, was, he thought, wholly insufficient, and he urged the members to use their influence to secure an increased amount next year. Some of the objects to be accomplished were mentioned by the Pomologist. The establishment and maintenance of Experimental Stations, one for each district, with systematic, careful and timely reports, were suggested. The collection of statistics of the great pomological industry of the Nation, its progress and possibilities, production and consumption of fruits, investigation of foreign markets, all these should receive attention as well as the cereal products, which he thought were scarcely greater in total value than the fruit product. New fruits should be tried and reported upon, and the adaptability of varieties to special sections of country be ascertained. The real facts about every fruit, good or bad, should be known. A cabinet of accurate fruit models, native and foreign, showing varieties as grown in different States and localities, together with a description of each fruit, plant, branch and foliage, was suggested. Reform in the nomenclature was also much needed. But at present "the garment must be cut according to the cloth." Our Congressmen must be urged to greater aid. "Let them know they represent pomologists as well as politicians and tradesmen." Several members spoke earnestly on this subject. Let us secure the proper appropriation. The total value of the annual fruit crop in the Union is now over $100,000,000.

"The Press and Horticulture" was the subject of the next paper by Herbert Myrick, it being read by the young editor himself. He said the press had done much for home fruit growing, but very little for the seller. There is too much space between the producer and consumer. Neglected reports of fruit crops should be looked after, and these should cover the whole country. The press has not done its whole duty to horticulture. Many papers refuse to notice new fruits, fearing to advertise some one. The subscriber wants his journal to print such news while it is fresh. More horticultural writers are needed. Some who have never written for the press sometimes send the best news because founded on experience. Local horticulturists should keep their papers informed of their doings. More attention to the business side of horticulture was urged. The proper marketing of the fruits is now more important than the further production of new varieties. Such are a few of the salient points emphasized by Mr. Myrick in his paper, which he read in a loud, clear tone of voice.

H. H.

NOTES FROM THE BAY STATE FAIR.

ALTHOUGH the statement is very generally made that the Bay State Agricultural Society was organized as a protest against the old New England Association, yet we think some of the managers, at least, have a higher object in view, and that while it is a protest against "the ring" as it is called; yet it will accomplish a much higher object for the farmers of New England in showing that a successful agricultural fair does not depend upon speech making, horse racing, or political wire-pulling.

The object of the Bay State Agricultural Society, according to its constitution, is to promote the interests of agriculture, horticulture and the mechanic and domestic arts connected therewith, and the raising of choice breeds of domestic animals in the Commonwealth, by holding exhibitions, institutes and courses of lectures and by publishing reports. Any person may become a member upon the payment of $1. Six consecutive annual payments, or the payment of $5 shall constitute life membership.

This is the first fair held by the society, and the first agricultural fair held in Boston for 30 years, the last one being held under the auspices of the National Agricultural Society of which the venerable Marshall P. Wilder was president at the time, in October, 1856.——A special bureau of information added materially to the comfort and convenience of visitors. Experienced men were in charge to direct visitors and give all desired information.

FRUIT AND VEGETABLE NOTES.

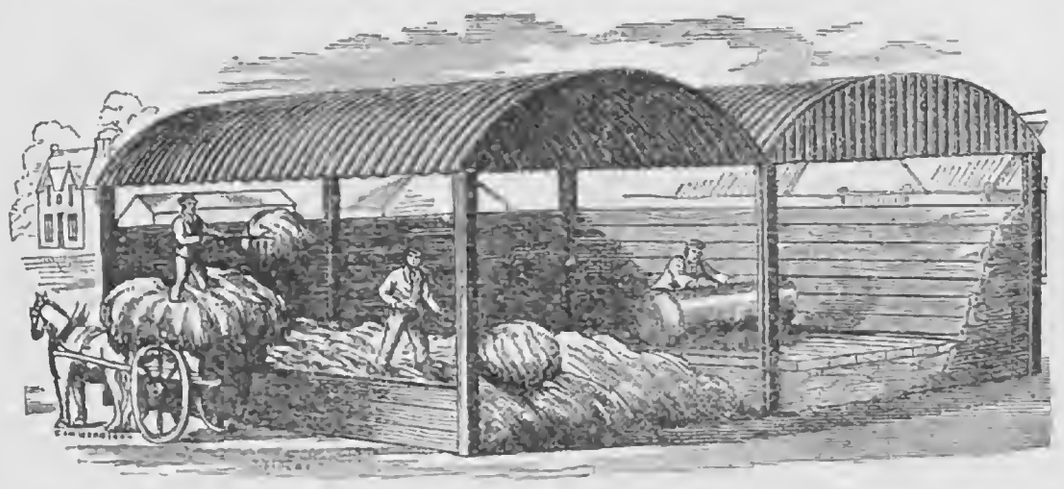
The special prize of $50, offered for the best show of apples, brought out a large and fine collection. They were shown on plates containing either half a dozen or a dozen of each variety.——Marlboro Grange showed 108 plates; Southboro Grange 72; Worcester Grange 168, and other granges smaller collections.——A number of new varieties, some of them unnamed, were shown——Maiden's Blush and a variety of sweet russet attracted much attention.

The show of pears, although not large, was of considerable excellence. As a matter of course, the venerable Marshall P. Wilder led the exhibit. Some remarkably fine specimens of Clairgeau, Angouleme, and Anjou, were shown.

Among the grapes we noticed many fine specimens of the Niagara. Two enormous clusters of the Black Hamburg and two of the White Syrian, exhibited by Mr. Simpkins of "Sandyside," Yarmouth Port, were fine.——The Eaton shown by Messrs. John B. Moore & Son, led all other varieties for size and beauty. The vines of this variety at the Rural Grounds have not fruited yet, but we are inclined to think very favorably of it, from the specimens we have seen and tasted.

The finest vegetable exhibit in the form of a collection, was that of Mr. James J. H. Gregory of Marblehead. An exhibit of over 200 kinds of vegetable seeds was of interest, and attracted much attention. A large number of seedling potatoes, some of considerable merit, were included in the collection. W. W. Rawson also exhibited a large number of seedling potatoes.

Houghton Farm made a big showing of potatoes, the product of each hill being put in a tray by themselves——In the general exhibit, Dakota Red led in number. Some very fine specimens of the Beauty of Hebron, Pearl of Savoy, and White Elephant were exhibited together with a large number of new and old varieties.——Messrs. Schlegel & Fottler showed a new cauliflower grown by Mr. Peter Fottler.——Mr. Aaron Low exhibited the Bay State Squash, a sport from the Essex Hybrid. The Bay State promises to be a valuable cooking acquisition. It has excellent cooking and keeping qualities.



PORTABLE SILO. Re-engraved from the London Live Stock Journal. Fig. 395. (See p. 704.)

IMPLEMENTS.

THE Brown Endless Cutter Mowing Machine attracted much attention. As its name indicates, the knives are on an endless chain, cutting always in one direction. If it will stand the test it is a great improvement in mowing machines. It has only been partially tested as yet.——Breed's Universal Weeder is a new implement. Its principle is something like that of the Thomas Smoothing Harrow. It consists of a series of steel rods placed vertically in a frame and is intended to scratch out the weeds and pulverize the surface of the soil, about young corn, potatoes, etc.——Peabody's Fertilizer Distributor is a new candidate for public favor. It is of such a character as to prevent a judgment of its merits without seeing it in actual operation——The new Blanchard Factory Butter-Worker was exhibited in operation in the Dairy Department. It consists of two cylindrical rolls between which the butter is run. It can be run by an unskilled dairyman, and the butter, it is claimed, cannot be spoiled by over-working. It is one of the best new dairy apparatus, and is already having a large sale.——Hill's aerator is a new device for cooling milk quickly after it is taken from the cow, by forcing a stream of pure, cold air through it from the bottom.——The Dana wind-mill was ingeniously arranged so that its merits could be shown without being in actual operation. Mr. Dana has made the subject of wind-mills an especial study, and his mill is the result of a long experience and many costly experiments——The Deerfoot Milk Cooler, shown by President Burnett, is so arranged that ice water from a tank flows through a hose into another tank, around the butter, and so keeps it cool——The Johnson Cream Separator is made in two parts so that the cream may be taken away in the upper vessel or cream holder, while the skim-milk is left in the lower one.——The Higganum Manufacturing Co. exhibited the new Clark's flexible disc harrow and the Sherman silage and fodder cutter. One of the novel features of this cutter is the arrangement of the feeding rollers so that they are adjusted and run with the knives, giving the machine a positive feed.——Belcher & Taylor showed their new reversible sulky plows. It is evident that sulky plows are increasing in popularity in New England. The Yankee swivel plow is evidently destined to be one of the most popular plows ever introduced. It has already had a large sale. This firm also manufacture and control the sale of the Hitchcock potato digger, which is not only an excellent potato digger, but may also, by a change in the mold-board, be used as a ridger or shovel plow.——The Planet Jr. implements are everywhere conceded to be valuable. It is not strange that the popularity of these tools should be so universal.——Mast, Foos Co., of Springfield, Ohio, made a large exhibit, showing their iron turbine wind-mill and Buckeye force pump, lawn mowers, etc.

Although the fair has cost in round numbers somewhere near $45,000, yet the probabilities are that the receipts will more than cover the expenses and leave a handsome sum in the treasury. This is especially gratifying, because it proves that even financial success may be attained without the adjuncts of horse racing and side shows, neither of which was allowed at the exhibition. It is not true that the financial success even of the largest and best agricultural fairs depends upon horse-racing, gambling, and leased privileges. G.

THE GREAT ST. LOUIS FAIR.

(RURAL SPECIAL REPORT.)

THE 26th annual great St. Louis Fair opened at St. Louis, Mo., October 4th, and continued until the 9th inst. The second day was Children's Day, and over 60,000 people visited the grounds, 40,000 of whom were boys and girls. All under 14 years of age were admitted free. On Wednesday the crowd numbered about 70,000, and on Thursday the attendance was the largest, over 140,000 being present. Practically Friday was the last day, and over 50,000 people gathered there. From this it will be seen that the fair was a financial success. The weather from the beginning to the end was all that could be desired. Not a drop of rain fell to dampen the ardor of those wishing to attend. Premiums to the amount of $70,000 were offered.

In the cattle department there was not an empty stall. A. Bourquin, Nokomis, Ill., exhibited a herd of Swiss cattle which attracted much attention as this breed is seldom seen in the West. Short-horns, Aberdeen-Angus, Holstein-Friesians and Jerseys were numerous. Altogether the show of cattle was a creditable one.

The sheep exhibit numbered, in all, about 300 head, consisting of all the prominent breeds. This department was better filled than usual. The accommodations for swine were found totally inadequate to the demand. Illinois and Indiana made the best showing.

In the poultry department Light Brahmas were first in number; then came the Plymouth Rocks. The show of turkeys was greater than last year. This department was full, and the exhibits much better than in former years.

Of agricultural implements the display was one long to be remembered. The long row of permanent buildings erected by manufacturers from all over the United States, presented a magnificent appearance. Osborne & Co. received the prize for the handsomest building erected in 1886, and Deere, Mansur & Co. received first prize for the largest display of implements. Among the new machines shown and deserving of mention was the Cyrus Roberts' shuck corn-sheller, cleaner and separator, made by Roberts, Thorp & Co. This machine cleans and separates the corn from the husks and cobs without shifting the elevator, and the grain can be delivered by means of the elevator spout at either side of the sheller into a wagon or gunny sack. The Whitman Agricultural Co. exhibited their new continuous hay and straw press in operation, with a new concentrating power device, which gradually changes the fulcrum from 21 down to seven inches, thus requiring great strength. This device gives the same plunger throw as in their former press, but with a great increase in power. They also showed their magic feed-mill, which is warranted to grind 30 bushels an hour with two-horse power. The old and reliable firm P. P. Mast & Co., exhibited their full line of implements tastefully arranged in their permanent building. Mast, Foos & Co. made a creditable display of implements, including the iron turbine wind-mill.

The Albion M'f'g Co., showed their spring-tooth harrow, cultivators, etc. We are pleased to see our old friend Col. A. W. Butt, (late a well known member of P. P. Mast & Co.,) financially interested in this old and thoroughly reliable firm, and heartily wish him all the success possible in his new enterprise. This company, as now organized, is officered as follows: Col. A. W. Butt, president and treasurer; Horatio Gale, vice-president; E. P. Burrell, secretary. The Syracuse Chilled Plow Co., exhibited a full line of their goods including hand and sulky plows, cultivators, and road scrapers. The latter articles being the only implements of the kind on the grounds, attracted much attention from the fact that they are inexpensive and capable of doing excellent work. They have received many encomiums from road commissioners and superintendents of streets. This company were the only exhibitors in their line from the Empire State. The Bucher & Gibbs Plow Co., manufacturers of hand, gang and sulky plows, made an excellent display. This enterprising firm have made and sold over 170,000 plows. F. E. Myers & Bro., showed the Myers' double-lock reversible hay carrier, one of the most perfect in use; also the new Myers' iron track carrier. This carrier is made of the best annealed malleable iron, and is very strong and neatly finished. They also show a full line of force and lift pumps. J. E. S.

A CORRECTION.—The RURAL's report of the poultry department at the New York State Fair is sadly at fault as regards numbers. The following are the exact figures: Fowls and guinea fowls, 740; turkeys, 16; geese, 140; ducks, 70; pigeons, 230; rabbits, 34; dogs and puppies, 28; making a grand total of 1258; noise-making specimens under one roof.

F. W. GAYLOR,
Sup't Poultry at N. Y. State Fair.

What Others Say

CINCINNATI'S LIVE STOCK TRADE.—In his annual address to the Pork Packers' Assoeiation of Cincinnati, Sidney D. Maxwell, secretary, presented the following synopsis of the live stock trade of that city during the past year:

The shipments from the eity in the past year aggregated of hogs 215,025 head, compared with 257,639; of cattle, 71,066, in comparison with 58,585, and of sheep, 382,983, compared with 373,128 Of these there were shipped from the Union yards, of hogs, 182,085, in comparison with 124,220; of eattle, 50,755, compared with 39,550, and of sheep, 348,891, in comparison with 332,238.

The net receipts, whieh are the only measure of manufaeture and local consumption combined, show a considerable increase in both cattle and sheep, little change having occurred in hogs. The net receipts of hogs were 564,931 head, compared with 566,052 in 1884–85, and 556,351 in 1883–84: of cattle, 127,738, in comparison with 111,562 in 1884–85 and 125,452 in 1883–4, and of sheep 182,279, compared with 167,154 in 1884–85 and 147,556 in 1883–84. The consumption of hogs shows no materinl change in three years; that of cuttle makes the largest exhibit in the same period, and a marked increase over 1884–85, while that of sheep is the iargest in the history of the city.

The weight of the different kinds of stock received, as indicated hy such as were weighed at the Union yards, which are fairly represeutative of the whole city, shows a slight increase in hogs, but a reduction in both eattle and sheep, the gross weight of the hogs having been 239.17 pounds, in comparison with 237.14 in 1884–84 and 228.10 in 1883–84; of cattle 980.04 pounds, compared with 987.33 in 1884–85 and 984.68 in 1883–84, and of sheep 78.18 pounds, in comparison with 78.59 in 1884–85 and 80.50 in 1883–84, the average weight of the sheep having been the smallest in eight years, the weight of hogs in the past year having been 2.03 pounds greater, and of cattle 7.29 pounds less than the preceding year.

A CORRECTION CORRECTED AND AN ABSURDITY EXPOSED.—

"We observe that some papers speak of the Martin Amber and Landreth wheats as being the same, or very similar. The editor who makes such statements knows nothing about the two varieties of wheat. They are very distinct from each other in growth, in straw and grain, and while the Landreth is an old variety under a new name, the Martin Amber is a *new variety*, and in many respects entirely different from any other sort. In fact, it is more distinct from other varieties than any other sort originated in many years."

The above statements, which we find in the Epitomist, published by the seedsmen J. A. Everett & Co., of Watsontown, Pa., are essentially untrue. The RURAL NEW-YORKER is the "some papers" alluded to. "The editor," it says, "that makes such statements knows nothing about the two varieties." We have three times raised the Martin's Amber beside the Armstrong or Landreth, a-d find them in all respects the same. Therefore it is untrue that "they are very distinct in growth, in straw and grain." "The Landreth is an old variety under a new name." How does the Epitomist know that? Merely beeause the R. N.-Y. has talked of the Armstrong for 10 years or thereabouts. But when was the Armstrong disseminated? Not until a year or so previous to the so-called Martin's Amber, and *then* it was called Landreth. If the originator of the Armstrong chooses to allow the Landreths to call it "Landreth," that is its proper name, since it was not generally known as Armstrong. It is *not* an *old* variety any more than Martin's Amber is an old variety.

This firm is now selling Yankee Prolific Oats at a high price, though it should know that this is an "*old* variety," viz., the White Russian. The same firm now offers a new wheat under the name of "Everett's High-grade," and the statement is made that it is a cross of "Martin's Amber on a number of other varieties!" This crossing was begun only *four* years ago, according to the statement, and although the cross was made upon "a *number* of different varieties" it has been *fixed* and offered for sale at $3.50 per bushel in four years! If the firm really knows anything about crossing wheat it would know that this statement is simply absurd. We dislike very much indeed to call attention to such matters, more especially in the present instance, since J. A. Everett & Co., are advertising patrons and friends of the R. N.-Y.

BOILED DOWN AND SEASONED.

PROF. SHELTON says that corn fodder to be valuable must be cut while it is yet bright and green .....

THE Farmers' Supply Association is the title of an organization of farmers, recently formed in Scotland to purchase agricultural supplies, especially fertilizers, from first hands at wholesale rates. This is the right way to proceed, says the Vermont Watchman. Co-operative buying for cash in large quantities does away with middlemen and enables manufacturers to sell on the closest possible profits....

MR. W. H. RAND tells the American Garden how the Marlboro Raspberry behaves in Vermont. With ordinary care it made the strongest growth for the first season that he ever saw, while the few berries which he allowed to mature were of large size and fine flavor. Naturally he looked forward to the next season's fruitage with much pleasure. But the plants seemed "suddenly to develop a decided antipathy to Vermont soil and treatment and were apparently tired of living. The few berries produced were of ordinary size and quality." Again he says: "So far the plant seems entirely hardy".... .....

MR. J. H. HALE, of South Glastonbury, Conn., speaks emphatically in favor of the Lucretia Dewberry, in the New England Homestead. He is convinced that it is a vigorous healthy plant, as hardy as the Taylor Blackberry, as productive as Snyder, as large as the Lawton and the best in quality of any of the blackberry family, and the earliest of all to ripen. He does not see how it is possible to produce a better fruit of its class.....

IN Ohio the Lucretia is planted in rows eight to 10 feet apart and four to five feet apart in the rows, forming a thick matted row or bed four to five feet wide. They throw up fruit spurs a foot high.....

ANOTHER writer in the same good journal condemns for one reason or other the following summer pears: Kirtland, Osband's Summer, Bloodgood, Clapp's Favorite, Madeline and Rostiezer. He commends instead of them the Summer Doyenné, Giffard, Manning's Elizabeth, Tyson, Margaret and Bartlett.....

WEBB & SONS' (England) farm-seed catalogue just received, gives an engraving of their Yellow Globe Mangolds, several of which weigh from 41 to 47 pounds.....

W. P. ATHERTON states that there are 3,500 named varieties of the apple; only 300 are in general cultivation, and of this number not over 50 possess any special value.....

MR. H. B. GURLER, the eminent dairyman, is an advocate of winter dairying, says the U. S. Dairyman. He claims that by changing from summer to winter dairying he has raised the average net profit on forty cows from $15 to $40 per head. His winter ration is early cut clover and Timothy, with equal parts by measure of wheat bran and corn meal. One Winter his milk suddenly shrank from 855 to 750 pounds, and on ascertaining the cause he found that late had been substituted for early cut hay. The above agrees with L. B. Allen's practice.....

MILK, it says, is a very necessary and nutritious article of human food, but unless produced from healthy cows, maintained under proper sanitary conditions with air and exercise, and provided with sound and wholesome food, there is probably no other article of food so full of danger and so liable to disseminate diseases of various kinds.....

THE Paris cows (25,000 in number) have been found a prolific source of pulmonary consumption, it is said... ....

A WRITER in the Dakota Farmer says that a few months since he visited a dairyman in New York, who had for years kept good common cows. Four years ago he bought a fine pure-bred Holstein bull and crossed upon his cows. Last year his two-year-old heifers gave double the quantity of milk his common cows did.....

ENGLISH cattle sales are well mixed up with oratory. At a recent Short-horn sale one speaker quoted a collier who said he must keep a bull-pup because "a man looks so stark-naked without a dog." In the same way, the speaker said every farmer ought to buy a good Short-horn because a farm will look so stark-naked without one. Another speaker said his cattle were descended from the stock of an old clergyman, consequently they were the most orthodox cattle in the kingdom..... ...

EVEN in Colorado farmers are taking steps to provide more fodder for the winter-feeding. There is serious talk of utilizing straw and stalks. We have seen tons of straw burned up to get it out of the way. Even during the burning farmers were complaining of hard times and taxes.....

SEE that the onions are *dry*, says the Farmer. Let them freeze solid. Then the thing is to *keep* them frozen till wanted. They must be well covered to keep them from thawing...

PROF. SANBORN, of the Missouri Agricultural College, estimates that the demand of sheep for food exceeds for each 1,000 pounds of live weight, that of cattle by 25 to 35 per cent.....

"IT must be remembered, however, that the sheep not only produces mutton, but a fleece of wool at the same time, while the steer converts its food into meat only. In another way the sheep is more economical than the steer. It feeds largely on what is rejected by the steer, and would otherwise go to waste.....

RANDALL tells us, says the National Live Stock Journal, that in trials as to the relative shrinkage from cooking between mutton and beef, the result was in favor of the mutton. Prof. Sanborn makes comparisons thus: "Given 100 pounds each of live steer and sheep at four cents a pound, live weight, if we substract eight pounds of wool at 20 cents a pound from cost of the sheep, the dressed carcass of the steer at 60 per cent. shrinkage, will cost 6.66 cents per pound; the dressed carcass of the sheep will cost 4.61 cents a pound; or the former costs 42 per cent. more than the latter." It would seem, from all the evidence, that there can be no doubt of the greater economy in growing mutton than in growing beef.....

ABOUT the last man to trust, says our Iowa contemporary, the Homestead, is the fellow who has left the farm years ago, has lost its habits, tastes, and instincts, and has no visible interest in it, and who is always putting himself forward as the friend of the farmer. This class of farmers will bear close watching.....

THE true friend of the farmer, says Edmund Hirsey, in the Massachusetts Ploughman, is not so anxious to circulate information that will encourage every one to go into the business of farming, as he is to better the condition of those who are already in the business.....

WITHIN the last five years L. F. Allen has adopted the progeny of thorough-bred Guernsey bulls on his herd of high-grade Short-horn cows, thus producing a better class of milkers for butter-making, the Short-horns not being always up to the required standard for that object. Thus he writes to the Agricultural Gazette, of England..... .....

THUS far, his short experience favors the Guernsey over either Ayrshire, Jersey or Holstein. He prefers them to Jerseys for their greater size and hardihood, robust forms, carrying more flesh and equal quality and quantity of milk, according to size.....

MR. ALLEN intends, as time progresses, with a continuous use of thoroughbred bulls, to breed the grades still higher, it having been fully proved with those who have long used both Guernseys and Jerseys that well-graded cows of those bloods give as rich milk and as high a quality of butter as thoroughbreds, at much less cost of purchase than they.....

MR. ALLEN says that we see occasional accounts of enormous American weights of butter in a seven days' trial of both Jersey and Holstein cows, the example being one cow selected from 50 or 100 or more, at an extra expense of food, oftentimes detrimental and sometimes fatal to the animal; but the tales reserve the average yields of the herds from which they are selected, which, if fully stated, would give us a much truer value of them. "Some people's geese are always swans." So it may be with the owners of these extraordinary cows. It may be that the regular quantity of butter given by these 25 to 40-pound butter cows in a single week's trial might not, on the same rations as other cows get, amount to over seven or eight pounds per week during the milking season of eight, nine or ten months.

THE proportion of different seeds which Mr. Allen has adopted is as follows: Six quarts of Timothy, four quarts of medium red clover and two quarts of Alsike Clover per acre. The smaller size of Alsike seeds makes them equivalent in number to the double quantity of the red, giving an equal number of shoots with the other. They come into full bloom about the same time, when the Timothy is just heading out, and when cut together at that period make, he thinks, the finest quality of stock hay for cattle, horses, or sheep.....

MR. CHARLES GIBB, of Abbotsford (P.Q.), Canada, says, in the report of the Montreal Horticultural Society that for general planting there is no evergreen like the Norway Spruce. It is cheap, transplants easily, grows quickly, and forms a large, beautiful tree. For wind-breaks and shelter belts it is the best evergreen; for hedges he prefers the native Arbor Vitæ, which makes a good hedge in less time.

WITH our 13 years' experience with evergreens, we should greatly prefer "for general planting," either the Oriental, White or Alcock's Spruce..... .....

ENGELMANN'S Spruce he says is a beautiful evergreen, perfectly at home in his climate. A specimen he has is remarkably glaucous. In Spring it is the color of frosted silver, not green at all. Nordmann's Fir is a beauty of a different type. Its long, dark, shining, rich foliage is very striking, but it is not hardy above the snow line. Engelmann's Spruce is is now known as Abies pungens. It is certainly the most silvery evergreen at the Rural Grounds and as hardy as any conifer ever grown there. Nordmann's Fir is indeed a grand tree, but even in this climate it is liable to be severely injured by peculiar Winters, though generally it escapes without the least harm.....

MR. GIBB has a variety of our White Spruce (A. alba caerulea) nearly as silvery as Engelmann's, but bluish. It is a dwarf and has borne its second crop of seed though the trees are not more than three feet high. The Siberian Fir (P. pichta) is remarkable for its refreshing green color, and such specimens as he saw in Russia showed no signs of early decay, as is the case with our native balsam. The Tiger's Tail Spruce of Japan (A. polita) is, he thinks, hardy or nearly so. It has stood the test of about five winters, but is small and often covered with snow. Its leaves are as sharp as pins. There is a dwarf form of our beautiful hemlock (Tsuga Can. macrophylla) a foreign-looking, compact shrub, just the thing to decorate a well-kept lawn with..... .. ....

IF we mistake not this Large-leaved Hemlock originated in the grounds of S. B. Parsons, of Flushing, Long Island. Our specimen is now about 12 years old and not over eight feet high. The leaves are twice as large as those of the common hemlock and the shrub is a fine plant for the lawn ....

A DELIGHTFUL companion to the Large-leaved Hemlock (macrophylla) is the Small-leaved Hemlock (microphylla). Growing near together, we are reminded of brother and sister ....

EXTRAVAGANT statements do not deceive intelligent farmers; but there are some young men who know nothing about farming, and some old men who are about retiring from business that catch at such bait, and are made to suffer by it.....

IT appears to Mr. Hirsey that the time has come when this class of writers should be banished from all leading agricultural papers, for they do a real injury without any corresponding benefit. What we want at the present time is facts fresh from the field of practice.

WE want to know what has been done, not what in our imagination we think might be done. Why should writers be continually trying to force everyone into the farming business by rose-colored statements. We already have farmers enough to grow all the grain and other products we need, and a great surplus besides. Had we not better turn our attention to the improvement of what farmers we have, so that they will be able to grow larger crops with the same expenditure of labor and material.... .....

MR. TUCKER tells the readers of the Farm Journal that his folks have all learned to like mutton. The children have clearer skins and the old folks less dyspepsia than when they ate lots of pork. The corned beef of the family is now corned mutton, having found out that there is no better meat for a change than a piece of mild, salted, fat mutton.....

MR. TUCKER thinks that grass seed is wasted by being covered too much. His experiment of sowing it all on top of the ground worked well—not a miss on a single field. His oats sown in the snow March 22nd on the wheat land came on wonderfully just as soon as the weather was warm enough for anything to grow, and they ripened with the wheat....

A writer in the National Druggist says that his son suffered with typhoid fever during a heated term, when the temperature of the room often rose to 90° or 95°, and the patient's temperature ran up to 105° F. and over. A number of tubs were placed in the room and kept filled with ice, and the doors kept closed. The temperature of the room sank to 80° or less, an average of 12° or 15° below the temperature of the other rooms in the house, and the cooler atmosphere not only added to the comfort of the patient, but aided in keeping down the body temperature and materially contributed to a final recovery.....

REICHMANN (Deutsche Med. Zeitung) draws, from a number of experiments, the conclusions as to the relative digestibility of boiled and unboiled milk; that boiled milk leaves the healthy stomach more rapidly than an equal quantity of unboiled milk and the digestion of boiled milk is more rapidly accomplished than that of unboiled milk.....

BANG, of Copenhagen, has expressed the opinion that milk taken from a tubercular cow is probably a fruitful cause of tuberculosis in children. He declares that tuberculosis of the udder of milch cows is by no means a rare affection, and is characterized by diffused, painless swelling of one, rarely of two, portions of the udder, proceeding without any constitutional implication. Boiling, he found, would destroy the bacillus, hence it is but prudent to resort to this process in every doubtful sample of milk.....

THERE is something very mysterious about the amount of medical knowledge possessed by old women, uneducated people generally—

and journalists, says the Druggists' Circular. It is an especially noticeable fact that the more ignorant a person, and the less commonsense he has, the more infallible remedies he can recommend.....

THE London Garden presents a beautiful colored plate of a new strain of zinnias called French Pompone. The development of this race has been the work of many years, the strain combining a refined and fully double flower with a dwarf and neat habit of growth.

IT is an open question whether cheap literature is helping us any toward becoming a thoughtful and reading people, says Charles Dudley Warner in Harpers'.....

Everywhere.

RURAL SPECIAL REPORTS.

Canada.

BELMONT, N. S., Oct. 4.—The hay crop, as a general thing, all over Nova Scotia is light. In some parts it is one-third below an average. Dry weather in June and July was the cause of the shortage. Since August we have had very wet weather which has helped the late hay and the after grass. The grain crops are fully up to an average. Potatoes are a light crop, and rottening badly. Other vegetables are fair crops. The apple crop is allowed to be the largest ever raised here. Large quantities are being shipped to the U. S. Prices: hay, $10 per ton; potatoes in bulk, f. o. b., 65 to 70 cents per barrel; turnips, carrots, beets the same; oats, 45 cents per bushel; barley, 60 cents; flour, $4.50 to $5.25 per barrel. L. D.

Colorado.

BOULDER, Boulder Co., Oct. 5.—This country is supposed to be remarkable only for scenery, but it is becoming remarkable for fruit also. We do not live quite on pure air, picturesque mountains and gorges, but find that with ordinary care and water, of which the supply is usually ample, as our irrigating system is excellent, we can grow almost any fruit or vegetable. I have on my farm 15 varieties of grapes—amongst them Agawam, Delaware, Diana, Brighton, Worden, Early Victor, Moore's Early, Salem, etc., all doing splendidly. All small fruits do as well as possible. Strawberries yield not less than 5,000 quarts to the acre, often much more, and I sold none at less than 12½ cents per quart. At first we got 25 cents per quart for blackberries, and the yield is said to be as much as 10,000 quarts per acre! I have the Hansell, Herstine and Turner Raspberries—Hansell does worst; Herstine has the best flavor; Turner fruits nearly till frost comes and is a very heavy bearer. Gregg does well, and for blackberries I have Snyder, Wilson and Kittatinny. We can grow apples here too. I have 40 trees, but they are not old enough to fruit except one crab only three years old, that bore this year. A Weaver Plum, planted last year, fruited this. My Washington Plum grows about three feet each year. Eastern people are surprised at our fruit and our mode of protecting it, as all small fruits and grapes are laid down and covered with earth in the Fall. H. M.

Illinois.

CHICAGO, Cook Co., Oct. 12.—It is now over 14 days since a drop of rain has fallen from Ohio to Kansas north of the Ohio River, and also extending up into Minnesota and Dakota. I do not consider that the severe drought of the late Summer and early Fall can be said to have yet been broken in Missouri and Kansas. Whatever rains these two States have had came in streaks. These two States also report more of a decreased acreage in wheat than any other State in the wheat belt. Michigan, Ohio, Indiana and Illinois have this Fall put in, I think, fully as much as they did last season. When the winter wheat crop was first thrashed farmers rushed it to market as fast as they could, as many wanted money, and many had been losers by holding their wheat for higher prices last year and the year before, and they wanted no risk this year. Many, too, who are able to hold their wheat refuse to sell at present low prices. Farmers in the spring wheat belt are now doing exactly the same thing as did the farmers in the winter wheat belt 60 to 90 days ago, and my advices from that region are to the effect that the movement of the crop has never been as large for the same length of time as exists now. Corn is drying out slowly. The weather was too warm and hot. We need more severe frosts to dry up the sap. So far October has seen only two killing frosts. R. N.

New York.

UTICA, Oneida Co., October 11.—The cheese market to-day ruled ⅛ cent lower than last week, and the result of the lower market was that some cheese was not brought out and the sales were over 2,300 boxes less than last week. The factory men want a higher price, not being willing to take less than 11½ or 12 cents for their September cheese, and the result was a somewhat cramped market. It may be that they will be able to bring it up next week, as the stock is held back considerably, and if other markets have done no better there will be a better demand next week. But the market appears to have reached the top. The sales to-day were 9,422 boxes ruling at 11⅛ cents. Little Falls sold 6,301 boxes, ruling at 11 cents. The butter supply is largely summer make and does not bring what the producers wish, as the jobbers are looking for fine September and October butter. This is not so easy to find. The latter sells readily for 25 to 28 cents. August and early September butter sells for 22 to 25 cents. There is nothing to say about hops. There have been no sales, though some hops of a fair quality are offered for 30 cents. Bad reports of the condition of hop roots are in circulation. R. L.

Ohio.

FLUSHING, Belmont Co., Oct. 4th.—Crops are good. Apples abundant. G. W. D.

Virginia.

RICHMOND, Henrico Co., October 11.—Despite all the crop reports, estimating the shortage of tobacco by frost from 12 to 25 per cent., this market has shown only a moderate firmness, and no decided advance has been sustained. It is true that some few sales of desirable bright wrappers have been made at prices at which they were formerly refused, and that fine cutters continue in strong demand, but of these, particularly fine-grade, the market has not been over-stocked. The weather has been warm, and what little late tobacco is out will be benefited thereby. There has been some speculative feeling shown in burleys, but manufacturers and others are too well stocked and manufactured goods are ruling too low for much advance. There has been no new tobacco offered in this market by which to judge of the crop, but in the upland market some fancy prices for cutters have already been paid. On the whole, prices are steadier, the decline has been stopped and the outlook is toward better prices for all desirable dark and bright leaf, by gradual steps only. T. H. M.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper

MAKING CUTTINGS OF GRAPES AND CURRANTS.

W. S. E., Orrick, Minn.—1. When should cuttings of grapes and currants be made? 2. What's the matter with my Gregg Raspberries? The canes lie almost flat on the ground. The land is a heavy clay loam highly fertilized.

ANS.—1. Make cuttings of the new wood of currants, about six inches long and plant them somewhat diagonally in mellow soil so that the top of the cutting is just above the surface of the soil. Compact the soil about the cuttings. Place them six inches apart if to be transplanted, or, if not, plant them where they are to grow. They will sprout next Spring. Make cuttings of grape-vines with two joints, cutting just above the top joint and just beneath the lower one. Treat these just the same as the currant cuttings. A fair proportion will sprout in the Spring. It is well to cover the soil over the cuttings with straw or something of the kind held in place by sticks, branches or anything of the kind. 2. The richness of the soil has produced, very likely, a rapid, succulent growth. The canes ought to have been supported.

TRANSPLANTING BLACK-WALNUTS; TRIMMING GOOSEBERRY BUSHES.

A. N. T., Frankfort, Kans.—1. Can one-year-old black-walnut trees be transplanted? 2. Do gooseberry bushes need much trimming?

ANS.—1. Yes. Take them up carefully, so as to preserve all the fibrous roots. Cut off a part of the tap-root. Do not expose them to the air. Keep them moist and covered from the moment they are lifted until planted. 2. All old wood that has borne say three crops should be removed, and so much of the younger wood as to give the bush an open form, with the stems equally distant from one another. If otherwise the berries are liable to mildew and rot. Severer pruning will give larger and fewer berries. It should be borne in mind that both the gooseberry and currant fruit mainly on wood that is two years or more old, and that too much of such wood should not be removed. Cut out all old gnarly or diseased wood. Keep the bushes shapely.

PERIOD OF GESTATION IN A MARE: KEEPING MANGELS.

W. C. W., Shrewsbury, Mass.—The average period for a mare to carry the foal is 44 weeks or 11 months. There is nothing exact about it, however. With 582 mares observed in France, the longest period of gestation was 419 days; the shortest 287 days and the average 330 days. Many notions are common among farmers to the effect that a small mare will carry her foal for a shorter time than a large one, and that a horse colt will be carried longer than a mare colt. These observations are not confirmed by scientific observation. 2. The Mammoth Long Red and Yellow Globe or Golden Tankard Mangels are both good—we prefer the latter. They are stored in pits or cellars. They should be protected from the frost, for they are as easily injured as potatoes. They should be made dry before storing. Ventilation is needed where the mangels are stored in pits. An easy way to provide this is to nail four boards together so as to form a square long box. This is placed down among the mangels so as to project some four inches above the top. When the last covering is put on this box can be drawn out and the hole filled with straw. When fed to cows the mangels should be sliced or pulped. Sheep can gnaw them when in larger pieces that might choke cattle. 3. The Purple-top White Globe turnip is very popular.

BEET LEAVES AS FEED.

L. B. & Son, Gaines, N. Y. We do not think the leaves of beets would injure the milk of your cows. We have fed them in small quantities without noticing any ill effects. We have never fed them in the quantity that you propose to use. As compared with ordinary corn fodder, the beet leaves would be, chemically considered, a better food for milk than the fodder. The leaves contain more protein and fat, but less of the carbohydrates. Still, no chemist can analyze an appetite, and practical feeding alone can determine the exact value of any ration.

Miscellaneous.

C. A. T., New Brunswick, N. J.—1. What is the average wholesale price of mushrooms in New York during Winter? 2. Would burning a strawberry bed to kill the weeds hurt the berry roots?

ANS.—This question can hardly be answered satisfactorily. Last year the price varied from 35 cents to $1.25 per pound, with an average of about 75 cents. There is a good demand for all that can be offered. They are mostly sold directly to marketmen or grocers without passing through the hands of middlemen. Mr. Henry Kelley, 85 Washington Market, New York, handles mushrooms. 2. No. The best way to do it, supposing the land to be free from stones, is to run over the rows lengthwise slowly with the mower, leaving the cut foliage on the rows until it is dried sufficiently to burn readily. If that's not enough, strew along the rows sufficient of the cheapest available combustible matter, and when the wind blows lengthwise of the rows, set fire to the stuff at the windward ends. It is, however, usually better to get one good crop of large berries and turn under the vines, as the second crop is usually inferior in size and quality. In that case rotate, setting out a new bed in a different place.

L. H., Nova Scotia.—Agents are selling Russian mulberry trees about three feet high for $1 apiece. Are they worth it?

ANS.—The Russian mulberry is a very indefinite name. It means no more than American chestnut or American fruit of any kind. The fruit is, so far as we have seen or heard, quite inferior to the kinds sold by nurserymen—though the most of the trees are hardier. But we do not see why the Russian mulberry should be valued for hardiness alone, since there are handsomer and hardier trees and trees more valuable for timber. In any case, the price ($1.00) is too much.

D. D. W., Obneyville, R. I.—Has the Akebia quinata ever seeded at the Rural Grounds?

ANS.—The Akebia rarely fruits. We have carefully examined the flowers and find that the pistils and pollen do not seem to mature at the same time. Some say that a northern exposure is favorable to fruiting. About 10 years ago we gave a picture of the bean-like fruit Would be glad to receive a few seeds.

F. S. W., Sweetwater, Tenn.—1. What s a grape with a dark red juice, and sour enough to make good jelly? 2. Does the Clinton rot at the South? How can rot in grapes be prevented?

ANS.—1. Norton's Virginia is one of the best for red wine and will also make good jelly. 2. Not that we know of. There is no way to prevent rot. For red wine, we would also suggest Cynthiana and Lenoir.

H. L. C. Charlton, Mass.—I am a little puzzled what to do with my grape vines to keep the mice from eating them the coming Winter. They nearly destroyed some of them last Winter by gnawing the vines into short pieces, and this season they have been eating the grapes from the vines. I set the vines near the wall. Would copperas sprinkled about the vines drive the mice away and would it injure the vines?

ANS.—We doubt if the copperas would be effectual. The only remedy that occurs to us is to set a number of the common mouse traps near the vines, baited with cheese or something that the mice are very fond of.

G. H. G., Tenafly, N. J.—What steam heater is small enough to heat a wooden country house of small size—say 15 x 15?

ANS.—We should not think it advisable to use steam to heat so small a house. The Raymond Furnace Company, of 76 Beekman street, New York, make steam heaters of various sizes, and can probably furnish you with such a heater as you may desire.

J. T., No. Madison, Ind.—Is the World Manufacturing Company, New York, reliable and is the Woolwich gun the fine article represented in their ads?

ANS.—The World Manufacturing Company is reliable, and the gun is, we think, well worth the price asked for it.

C. A. B., New York.—Unfermented wine or grape juice is practically a "preserve." It is not wine at all. To make it express the juice from the grapes, sweeten to suit the taste and place in porcelain kettles over a good fire. Bring to a boil and skim off any impurities which may arise. Place hot in bottles or jars and seal tightly. Keep in a cool, dark place.

E. L. M., Charlemont, Va.—For information concerning Devon cattle write to J. Buckingham, Zanesville, Ohio. We understand the American Devon Record to be the only registry in this country for Devon cattle.

W. H. O., Montague, N. J.—Who in New York receives early lambs for sale?

ANS.—Jelliffe Wright & Co., 13, 15 and 17 Centre Row, West Washington Market, New York City. It is of course better to send an invoice with the shipment.

F. R., Summit Station.—The Belden agency of this city have thus far given satisfaction, so far as we know. The gun they offer is probably worth the money. We think you will obtain satisfaction from them.

Several Subscribers.—The list of book premiums will be published with the account of the Free Seed Distribution in our Thanksgiving Number—issued November 13.

A. E. H., Newark, N. J.—The grape sent for name is of the Æstivalis class resembling Herbemont.

J. A. G., Marion, Va.—We think you will like the "rustless" iron water pipes better than any others. The "Rustless" iron costs more than others; but it is cheaper in the end, as it is safe and clean. It is positively rustless, unless broken or cracked.

J. W. G., Mattituck, L. I.—The wheat sent for name seems to be the Clawson.

DISCUSSION.

H. R. JR., BROOKFIELD, MASS.—For the information of an inquirer in a late RURAL I would say that the true name for Squantum Corn is Potter's Excelsior. It was introduced by Thomas Potter, of East Providence, R. I.—a seed and vegetable grower. There is in Providence, a Squantum Club, the members of which go fishing in Narragansett Bay every Summer, and always take along with them Potter's Excelsior Corn, because of its excellent quality. Hence the name of Squantum Corn.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING October 16, 1886.

Miscellaneous Advertising.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your grocer for Dixon's big cake.

LADIES We make a specialty of giving premiums for the forming of Tea Clubs for our pure Teas and Coffees. **We defy the world on price and quality.** No house gives same quality goods and premiums. A host of useful and ornamental articles to select from. Silver-plated Casters for $5, $7, and $10 orders. Silver-plated Tea Sets, elegant designs, for $30 and $50 orders; or beautiful Gold-Band China Tea Set or handsome Decorated Dinner Set, Moss Rose Toilet Set, Gold and Silver Watches, Clocks, etc. Illustrated price and premium list, and full particulars sent free. **SPECIAL OFFER:** To every tenth person that answers this advertisement we will send **free one pound of choice Tea.** Write at once.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, OCTOBER 23, 1886.

We all of us know, or think we know, the effect of gormandizing on human beings. But we seem to take it for granted that the cow may be stuffed without any ill effects. A few generations will tell a different story.

In Broadway fruit houses the Niagara Grape is selling for 75 cents a basket weighing three pounds. They are fine bunches with the bloom well preserved, as if they had been grown in bags. We guess the Niagara is a success.

We shall be pleased to send the November 20 number of the R. N.-Y. to any list of names with which our readers may furnish us. We trust that our readers and friends will interest themselves in forming clubs of five or over, thus securing the club rate of $1.50 for each subscriber from now until the end of 1887.

Very soon we shall please our readers by a series of articles under the caption of "Bucephalus Brown's Notions and Ideas." They will appear monthly, or oftener, during the rest of the year, and during 1887. The author, whose real name will not appear—not until the end of the series, at least—is one of the most talented practical farm writers in America.

The Giant Pera Cucumber was tried at the Rural Grounds during the past season. The cucumber in form is much as represented in the engravings, few-seeded and tender-fleshed. The vines, however, were less rugged and productive than better known varieties. Nichol's Medium Green Cucumber is the best variety for pickles we know of. They are uniform in shape and size and the vines are very productive.

No one can doubt the efficacy of night soil as a fertilizer. In its raw state it is too offensive to be used, whatever its value. Its effect is immediate and its valuable properties are soon wasted unless carefully applied. It is far more agreeable and economical to apply it in the form of a compost. The compost can be prepared in the closet, by using light water-tight boxes or buckets and plenty of sand or dust. It is sensible, business-like farming to close up the old vaults and make compost of the contents.

Two specimens of the Fastigiate Oak were planted in the Rural Grounds about 10 years ago. The third year one was killed during the Winter. The other has never been harmed and is now 30 feet high, though scarcely more than six feet in diameter. In its way it is a first-rate tree. It holds its leaves fresh and green long after the leaves of most other trees have changed in color or fallen. For narrower portions of the lawn where paths or roads converge and there is little space for trees, the Fastigiate Oak is just the thing. It is a variety of the European Evergreen Oak.

As the result of the past season's work in still further crossing wheat and rye, we may report as follows: There are now growing from one cross of rye upon half wheat and half rye heads, eight plants which are therefore by parentage three-quarters rye; from another cross of the same, one plant; from another cross of the same, one plant; from another cross three plants half wheat and half rye, from another five plants which are seven-eighths rye: from another five plants which are also seven-eighths rye. These hybrid seeds are always shriveled and small, and the plants are for the most part small-leaved and delicate. The seeds were planted September 23.

One of our neighbors was successful last year in keeping celery until Spring in this way: He dug a pit wide enough for three rows of celery and nearly as deep as the hight of the plants. Then, instead of covering the tops with litter, old shutters were placed on either side, forming a peaked roof, the angle being about 45°. This gives a considerable air space within the roof, so that the leaves remain green and the plants do not begin to rot so soon as when the leaves come in contact with the straw or whatever material is used to protect them from frost. As the weather grows colder, litter is piled over the shutters. The pit is opened at one end as needed, and the shutters are removed as the celery is taken out.

The views of the Knights of Labor on the race question will make both friends and enemies. The idea that the colored laborers at the South should be educated, taught the real value of their labor, and upheld in an effort to obtain this value, will be considered doubly just by all who have never seen the negro exactly as he is. The great majority of people in this country who firmly believe that "a man's a man for a' that!" will applaud the action of the Knights in grappling with a vital question. The Southern members of the K. of L. and the property owners at the South will not look upon the matter so kindly. The country is sure to find some day that the proper educating and training of its mental paupers, both black and white, is the greatest problem of the day. We have no place in this country for ignorance or stunted manhood.

We examined a horse last week, that came as near our ideal of the perfect farm horse as we have seen. Broad and strong, gentle and kind, of good color, a willing worker, a fair roadster and with far more than the usual equine intelligence. The first reason her owner gave for her excellence was: "It cost $50 to sire her." There is a good deal in that remark. If you will think it over you will find that every first-class horse that you know of cost more money than the common horse. A $50 colt is a $50 colt, and a five dollar colt is a five dollar colt, every time. Back in the pedigree of every first-class animal will be found a good-sized service fee. We do not wish to be understood as saying that by simply paying a large service fee a farmer may consider himself sure to secure a good colt. We do mean that the service of a first-class, shapely, well-bred animal is worth ten times as much as that of a scrub. There is no law of nature that can enable scrubs to produce anything but scrubs.

Mr. J. T. Lovett, whose statements in such things we have always found trustworthy, says, in his fall catalogue, that he fears the Earhart Everbearing Raspberry will prove identical with the old Ohio Everbearing. This surprises us not a little. The writer is not familiar with the Ohio except from hearsay, and we have presumed that its "everbearing" power was confined to the production of a moderate crop in the Autumn. But the Earhart at the Rural Grounds bore during the *entire* season. Its first crop was abundant and its later crops scarcely less abundant. If *this* is the old Ohio Everbearing, then we are left to wonder why this old variety is not found in every garden instead of having fallen into desuetude because its first crop was less valuable than that of other blackcaps, while its second or fall crop did not amount to much. We are naturally exercised over this question, if question it is, since we have commended it to our readers as a new variety of high promise, and many of them no doubt have been induced to purchase it at a price much higher than that they would have been obliged to pay for the Ohio, which probably they would not have cared to purchase at any price.

NOTICE.

The Thanksgiving Number of the Rural New-Yorker will be dated November 20th. It will present a full account of the Rural's next Seed Distribution, and we shall issue 24 pages. Advertising rates will be the same as usual for the regular paper (30 cents per line) and 50 cents per line for the Supplement, which will be sent out from its date until next June. *Advertising space strictly limited to six columns.*

PRICES OF WHEAT.

Last Monday wheat at Chicago was 69¾ cents a bushel—the lowest price for 24 years except in December, 1884, when it was down to 69¾ cents. On a backward examination of market figures, we see that wheat was not so low since May, 1862, when it sold at Chicago for 66 cents. In the previous January the price was 65 cents, and in 1861 it was at one time 55 cents. In 1872 the lowest and highest prices were $1.01, and $1.61, and in 1877 they were nearly the same. In the intervening years the bottom prices ranged between 80 and 90 cents. In 1878 the price was considered very low at 80 cents; but owing to the enormous crop of 1884 (512,000,000 bushels) wheat at Chicago went down to 69¾ cents, the range being from that to 96⅛ cents; and in 1885 it was from 72¾ to 91¾. Last year the crop was only 357,000,000 bushels, but the large surplus carried over from the previous year and heavy foreign crops lessening the export demand, kept down prices.

The latest report of the Department of Agriculture indicates a crop of about 457,000,000 bushels this year—over 10,000,000 bushels more than was indicated by the previous report. This unexpectedly large crop, together with a heavy decline in demand for export, has knocked down the prices of wheat everywhere in spite of the threatening aspect of European politics. Should war break out across the Atlantic—and all indications are very warlike just now—prices of wheat here would at once jump up, as the foreign demand would immediately increase owing to the partial suspension of agricultural operations, the probable destruction of many crops and the greater consumption of cereals inseparable from the movements of vast armies in belligerent countries.

During July and August the foreign demand was lively, as we exported 27,000,000 bushels of wheat, including flour, against 12,000,000 in the corresponding months last year. These large receipts abroad, and the heavy deliveries in our home markets, induced foreigners to suspend buying in a falling market, although it is admitted that Europe will need an unusually large supply of wheat from abroad before next harvest, so that, war or no war, the export movement is likely to be soon resumed. Is wheat at 70 cents at Chicago profitable when the average yield is only about 12 bushels per acre, and a large proportion of the area under it must, therefore, yield considerably less? Prices will probably go up before long with the resumption of a brisk export demand, but "dollar wheat" in Chicago, is probably a blessing of the irrevocable past.

A CAUTION NEEDED.

That advertisement of vast estates in the moon is still appealing to public gullibility in the columns of some excellent papers. A few days ago we were pained to see it the most conspicuous display in the last issue of an esteemed agricultural contemporary in this State. Before that, it seemed to find place only in the weekly "agricultural" issues of the non-agricultural journals. From the large number of inquiries we have lately received with regard to it, it is very evident that it has been widely read by the farming community, and from the anxious tone of some of them there is no doubt that the writers are disposed to put faith in the tangible existence of the mythical fortunes it tells about. And why shouldn't they? The conductors of the papers in which it has appeared are intelligent, well educated, wide-awake men, and, of course, they must have thought the statements it contained trustworthy, otherwise as honorable gentlemen they could not have admitted it into their columns to beguile their patrons It cannot, of course, be for a moment supposed that any financial consideration blurred their perception of its character.

Many of the papers that have published it, however, have from time to time also published the exposures of the unsubstantial nature of the estates it speaks of, as made by the United States Ministers in England, Holland and Germany, through the State Department. But what publisher reads his own paper, or can remember all it speaks of—in business hours, at any rate? Then, again, who is free from mistakes? Do not deceitful advertisements occasionally creep into even the most carefully conducted papers?

True, these are generally small, inconspicuous items, as more pains are generally taken to investigate the character of lengthy advertisements demanding extra display; but the fact that the advertising company is incorporated under the laws of this State may have misled them, although a tyro ought to know the incorporation of a company is in no way whatever a proof of its trustworthiness.

When errors of this sort are made, however, by which others may lose money, it is certainly the duty of those committing them to make reparation by exposing the real character of the advertisements. In the present case the advertisers must spend a great deal of money for advertising, and must expect to recover much more from the gullible public, so that a warning to the unwary is all the more needful. We are glad to see that other papers are seeing the necessity of this. The New York Times and the Chicago Tribune have already editorially exposed the mythical nature of the estates. The New York Journal of Commerce, the oldest and one of the most conservative commercial papers in the country, has emphatically denounced the "enterprise." It is to be hoped that other papers, especially those that have published the advertisement, may be equally outspoken. Agricultural papers especially should speak boldly on the matter, as it is very evident that the advertisement was particularly addressed to the agricultural community in the expectation that farmers are superlatively gullible.

BREVITIES.

A friend sends us fruits of the beautiful hardy vine Akebia quinata. It has never fruited with us and rarely fruits anywhere.

One of the finest white grapes we have seen was sent to us by Marshall P. Wilder last week. It is called Minnehaha and is a second cross by E. S. Rogers, of Muscat of Alexandria on Massasoit.

Buhach or Pyrethrum powder is everywhere acknowledged as the most effectual of safe insecticides for the cabbage worm. We are glad that our early experiments with this powder have proven to be of service to all who have used it.

Our experience this season with Savoy Cabbages is unfavorable to planting them in large quantities either for home use or market. A large proportion do not head well. In quality they are richer than the plain-leaved kinds, that is, more oily—but not so tender.

At the Danbury Fair Mr. Theron E. Platt exhibited specimens of the Stray Beauty Potato and Bliss's Triumph as raised by him. They seemed exactly alike, and Mr. Platt thinks they are identical and says they have the same peculiar habits of growth.

Mr. Bruggerhoff, of Thorburn & Co., favors us with a few burrs of his Japan Chestnut to show that the nuts are much smaller than usual. They are about twice the size of the average American chestnuts, which, in the vicinity of the Rural Grounds at least, are also much smaller than usual. Mr. B. may be considered the introducer of the Japan Chestnut to this country.

Dr. T. H. Hoskins, of Vermont, writes us, under date of October 9, as follows: "I have just finished the gathering of my apples, a most toilsome job, as help that know anything about handling fruit are utterly unobtainable here. This is a point in orchard pioneering that did not occur to me in advance, and my orchard has become a terror to me. I have nearly 2,000 bushels on an orchard that in full bearing is capable of yielding more than as many barrels, and don't know how I am ever going to handle them. But perhaps you will say 'sufficient unto the day is the evil thereof.'"

The great success of the Bay State Agricultural Society's Fair at Boston last week is an instructive lesson to fair managers elsewhere. The new organization attracted some of the best farmers in the State, who were determined to dispense with horse racing, gambling, beer and liquor guzzling, and the numerous other disreputable attractions from which shameful profit is sought at too many miscalled agricultural fairs. The Society has made a brilliant success from the start, having cleared about $10,000 and enjoyed the satisfaction of having given sterling value for his entrance fee to every visitor at the fair.

The habit, on the part of a class of women, of carrying lap dogs is increasing A more senseless occupation for American women can hardly be imagined. Old Plutarch, centuries ago, wrote: "One day, in Rome, Cæsar, seeing some rich foreigners nursing and petting young lap-dogs and monkeys, inquired whether in their parts of the world the women bore no children—a truly imperial reproof to those who waste on animals the affection they should bestow on mankind." Women who carry these foolish dog babies about are apt to be those who would pass a crying child with contempt.

A telegram from Walla Walla, Oregon, on Thursday, says that a drove of 40,000 head of cattle from Northern Montana to British Columbia, had to be abandoned when nearing the British line, owing to the unusually dry season which had shriveled the grass and dried up the springs. The poor beasts had been reduced to skin and bone from hunger and fatigue, many had already died, and not over 200 of the 40,000 are expected to be alive next Spring. They belong to a St. Louis syndicate which will lose $250,000. Is your sympathy with the cattle or the syndicate? In any system of herding which causes such untold suffering to poor, dumb brutes, retribution on those engaged in it appears just and providential.

The great strike at the stock yards at Chicago, which has hitherto been confined to the establishments where hogs were slaughtered, is certain to extend to the dressed beef trade as well. Of hog products there is a vast quantity on hand, so that although the prices may be raised a little, there is no danger of scarcity for weeks; but the stock of dressed beef is small, and consumption follows so closely on production that a stoppage for a few days will seriously interfere with the beef supply of Eastern cities, which now receive a large share of what they need from Chicago. This may temporarily put up the price of beef stock in the East, and farmers should take advantage of any such rise to market their cattle. In the vast territory tributary to Chicago hogs and cattle should by all means be kept back or sent to other markets until the trouble is settled, for prices are certain to be unprofitable in an overstocked market.

The Apiarian.

INVERTING THE BROOD NEST.

PROF. A. J. COOK.

Inverting hives; new Hedden hive; the Shuck hive; advantages of inverting; invertable hives and reversible frames contrasted.

ONE of the late innovations in bee keeping which has gained favor so rapidly that we must think it has come to stay, is that of inverting the frames or hives. In either case the brood nest is turned up-side down. This was first accomplished by so arranging the frames that they could be readily inverted. Instead of the old Langstroth frame with its single top-bar, which had projecting ends, a perfect rectangular frame, with no projecting bars, was made to swing in a larger frame with projecting top bar and end bars which reached a little below the middle point of the end bars of the inner rectangular frame. By use of wire nails the inner frame is pivoted to the outer half frame, so it can swing in and be inverted in a moment at any time. I have used these frames now for two years, and like them so well that I am changing all my combs into these reversible frames.

Within the last two years an attempt has been made to improve upon this plan by inverting the entire hive. The new Hedden hive, which has caused more stir among bee-keepers than any other recent invention, is about the size of the common Langstroth hive, and consists of two horizontal sections, which can be used either independently or together. Thus it will be seen that the frames in this hive are only about half as deep as those of the usual Langstroth. These frames have close-fitting end bars, and when put into the hives rest on tin projections, which are tacked to the bottom of the end boards of the hive. When all the frames are put into the hives, a wooden thumb-screw which is set in the side board of the hive opposite the end bars of the frames, is screwed up. This holds all the frames firmly, and so when these screws are thus turned the frames are all held securely and the entire hive can be turned bottom up in a moment.

The Shuck hive which, like the Heddon, is patented, can also be inverted in a moment. This hive is full size, and is inverted by a sort of a derrick. I have both hives in our College Apiary. Both are practical, but from its severe simplicity I much prefer the Heddon. Perhaps, with longer experience, I might change my views.

The advantages of inverting are these: 1st, combs are built and fastened to the frame on all sides. Every bee-keeper knows that bees always fasten combs firmly at top and along the upper half of the edges. When this is once done we have only to remove the frames, when the union is made complete about the whole margin of the comb. The advantages of such entire union are, first, the combs are held securely and are in no danger of falling out when extracting or shipping bees. Second, the spaces between comb and frame which serve as hiding places for queens are removed. This last is a great gain, as any one who has sought for queens is aware. Third, reversing frames places the honey below the brood, which is unnatural. Hence if just as the season opens, when we place our sections on the hive, we reverse the frames, the bees at once fall to and carry the honey above the brood, or into the sections where we wish it, and once employed in filling the sections they make no halt till the season closes. If, when we reverse we uncap some of the honey, we will hasten this rush to the sections. Many who have been annoyed at the persistent refusal of their bees to work in sections will appreciate this argument in favor of reversible frames, though to the expert apiarist this is the weakest argument of the three.

Fourth, when a bee-keeper has all the bees he wishes he can preclude swarming by this simple work of inversion, which in case the hive is reversible is but the work of a moment. Curious as it may seem, the bees at once cut away or remove all queen cells as soon as the combs are turned upside down. Thus by inverting the hives each week swarming is prevented, and all but the work of a moment.

Of course, this last, indeed all the points argue loudly in favor of the reversible hive. To invert a hive takes a moment; to reverse all the frames is the work of several minutes. The object of the horizontal division of the brood chamber in the Heddon hive and also the advantages of the slatted queen-excluding honey board, and bee-spaces are marked and are worthy a separate consideration which they shall receive in another article.

Miscellaneous.

TRANSCONTINENTAL LETTERS. LXVII.

MARY WAGER-FISHER.

The Tehachapi Pass; an inquisitive custom; Mojave Junction; flowers in a desert; an arid lake; alkaline sea beds; Barstow; a cheerless home; the "Great American Tree"; a desolate wilderness; in Arizona.

WE left Tulare at two the next morning, and it was full day-light as we approached the Tehachapi Pass. A very important feat of railway engineering was accomplished in building the road through this spur of the Sierra. The Pass is 27 miles in length. There are 17 tunnels, and from three to four hours are consumed in the transit. It is the custom on the transcontinental lines on the Pacific Slope for a man to pass through the trains every day at certain points, ask passengers their names, where they are from, and where they are going, and write thei replies in a book which he carries. The result of this investigation is that the names, etc., are forwarded by telegraph to the San Francisco and Portland newspapers, so that the readers of them who are in the habit of looking over the list of expected arrivals, if they come upon the name of a friend, often pleasantly surprise him by extending a welcoming hand at the station or wharf, explaining, "Why I saw your name in the paper, and that you would arrive in this train." Tehachapi is one of the places where the names are taken in the north-bound train. The slow movement of the cars through this pass, and the alertness of the passengers to see the construction of the road, oblige the busy trainman who sells books, papers, etc., in the cars, to take a rest and rearrange his wares. I asked one of them before reaching Tulare what were his daily profits. He answered the question by saying his average daily sales, including literature, fruit, and cigars, amounting to $30.

Between Tehachapi (pronounced Te-hash-a-pee) Pass and Mojave (Mohâve) Junction, a ride of an hour or so, the road lay through orchards of yucca, the trees being from six to 15 feet in hight, and looking very odd and lonesome in their arid and deserted surroundings. At Mojave we had breakfast, and as we here left the Southern Pacific Road for the Atlantic and Pacific, over which we were to travel several hundred miles into Arizona to the Grand Cañon of the Colorado, we had a wait of an hour or so. The delay gave us time to replenish our lunch basket (a necessity on all lines of travel) and for two small loaves of bread we paid 25 cents. The train-man charged the same for half a dozen oranges, such as were selling in San Francisco and Los Angeles for 15 cents per dozen.

The station at Mojave Junction is in the midst of what goes by the name of the Mojave desert—a desert from lack of water, but at this time it was gorgeous with flowers, and one could but wonder how the pretty things had the courage to live and bloom in that dry, sandy, treeless, almost rainless region. I picked three varieties of phacelia, John'swort, large and beautiful, a curious cruciferous plant, the gorgeous flowers set at regular intervals on large, canary-yellow stalks that were hollow and shaped like kelp bladders—also a variety of collonia, very beautiful. But one station east of Mojave every flower and sign of vegetation completely and suddenly disappeared, and we were launched (on wheels) on a dry alkali lake 2,100 feet above the sea level. This lake was six miles wide and probably four times as long. The train was stopped owing to a hot box, and we got out and took a promenade on this extinct sea—a strange and wierd sensation! Some sage brush grew in the sand dunes on the shore of this lake-bed which was as level as a house floor, and the conductor said that he had once seen the bed flooded by a cloud burst. It is very generally understood, I suppose, that all these interior alkali basins, and, in fact, most of these arid and desert regions were once under water, which has gradually evaporated, leaving its immense deposits of salts.

At Barstow we crossed the Mojave River, a slender stream. At this point the desert plain is broken by hills, and an occasional team of horses with a driver indicated the possibility of animal existence in that region. At Barstow the Southern California Railroad begins, which runs to San Diego, and the railway company has here built an attractive eating and lodging house. We waited here three and a half mortal hours for the overland train from Los Angeles. My heart ached for the few families placed in the forlorn wooden shanties planted about the station. A terrible place for women and children to pass their lives, hearing the wind forever blowing over the desert. Some cottonwood trees had been planted along the stream and were growing well. This beautiful, brave tree grows from coast to coast and spreads its grateful shade where nothing else will thrive. To my mind it is the Great American Tree, and I always feel like taking off my hat to it, particularly when it condescends to grow in a wind-and-sand-swept town of the desert.

As we rode on, the San Francisco Mountains came into view and bounded the desert on the north. East of a station called Newhall, we passed a large crater in ruins—two miles perhaps in diameter, some portions of the blackened walls a hundred feet high. To the north lay what is called Death's Valley, and the train skirted this dismal and foreboding region. At intervals all of that day our eyes were gladdened with beautiful flowers, specimens of which we were always enabled to obtain, and with the aid of a small California Botany (Rattan's) which I carried, we found out the names of most of them. The conductor and one of the brakemen became interested in our flower gathering, and brought me several beautiful specimens, among which were abronia and superb œnothera—white. In various places the action of the water in wearing away and shaping the mountains was very noticeable, and the forms produced by water sculpture have a peculiar beauty. Among the passengers was a man in blue overalls, whose talk could be heard from one end of a car to the other. He was 50 years old and this was his first ride in a steam car. He lived in Los Angeles and had crossed the "plains" with an ox team years before. Empty tin cans were scattered in profusion along the way, and at times we actually descried cattle with their noses to the ground apparently feeding on imperceptible grass, dry, brown, like threads as it was. The next morning at 5.45 we alighted at Peach Spring, in Arizona.

Pomological.

THE TYSON AND SOME OTHER PEARS.

I notice in the RURAL some dispute as to the qualities of the Tyson Pear. It is not a tardy bearer unless under conditions that will render most of our pears equally tardy. There are a few varieties, like Belle Lucrative, that are inclined to bear and overbear at a very early age and under almost all conditions; but most pears need special attention to a few points. 1. A pear tree that limbs out near the ground, say two or 2½ feet, will bear four or five years earlier from the nursery than one that branches only at seven or eight feet. This is so peculiarly true that when setting an orchard I have made special arrangements with nurserymen to furnish trees headed low. The Tyson does not differ from the Bartlett, Sheldon, Anjou, and others in this respect. Standard trees will bear as early as dwarfs and as profusely if treated in the same manner. 2. Pear trees vary in habit on different soils. I do not know that any rule, however, as to early bearing holds good except the above.

The Tyson, in my judgment, is the very best of our early pears. With me it has borne very early and very profusely. Its habit of growth is good, and the pear, while not showy, is marketable. It ranks among early pears where Sheldon and Seckel rank among later summer pears; and where Anjou stands among late autumn pears—among the best 10 of all varieties. Rostiezer, which the RURAL commends, is so straggling a grower and yields, although profusely to a branch, yet so small a quantity to a tree that it is unprofitable. Clapp's Favorite and Belle Lucrative are among the worst of pears to blight. Madeline is hopelessly given over to the same trouble. E. P. POWELL.

Varions.

AT French poultry shows it is said that the dressed birds always attract attention. The birds are killed and dressed and exposed in neat glass cases. Everything is so neat and dainty that this exhibition forms one of the best features of the show. Why is this not a good plan? At our shows we exhibit the live birds at all ages and their eggs. It would surely add to the interest if specimens of the different breeds could be shown without their feathers. Why not make a class for dressed poultry? Make out a "scale of points" so that the percentage of offal, of breast-meat, of neck, &c. can be obtained. Who will be the first to put this idea into practice?

FLESH OF DISEASED POULTRY—The meat of diseased animals is condemned as unfit for human food. This is right, but why not include the flesh of fowls suffering from chicken cholera? It cannot be other than injurious to take cholera germs into the system. We know families whose rule is to kill all "droopy" fowls for use on the table. Many birds sick with the cholera are killed and eaten in this way. A more disgusting practice it is hard to think of. Eggs or flesh from flocks where cholera is prevalent should never be taken into the stomach. We hope to have a law some day that will stamp out cholera as well as cattle disease.

HOUSE THE MANGELS.—It is high time the mangels were housed in all the Northern States. After the 15th of October a frost may occur at any time sufficiently severe to cause the skin to peel from them, and this will seriously injure their keeping qualities. They should be pulled on dry days; the tops be removed, and they should be at once stored in cellars or pits and be well ventilated until they are fully dried.

Niagara Co., N. Y. J. S. W.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

REAPING.

ALONG the east strange glories burn,
And kindling lights leap high and higher,
As morning from her azure urn
Pours forth her golden fire,

From rush and reed, from bush and brake,
Float countless jeweled gossamers
That glance and dazzle as they shake
In every breeze that stirs.

A bird, uprising from the grain,
Flutes loud and clear his raptured note
That mingles with as blithe a strain
As e'er thrilled human throat.

Amid the tasseled ranks of corn
She stands breast-high; her arms are bare;
And round her warm brown neck the morn
Gleams on her lustrous hair,

The sickle flashes in her hand;
The dew laves both her naked feet;
She reaps and sings, and through the land
She sends her carols sweet.

The wind breathes softly on her brow;
To touch her lips tall blossoms seek;
And as the stricken columns bow
They kiss her glowing cheek.

O happy maiden! in her breast
Guile hath no place; her virgin sleep
Vain thoughts ne'er trouble; she is blest;
She hath no tears to weep.

She knows nor longs for prouder things;
Her simple tasks are all her care:
She lives and loves, and reaps and sings,
And makes the world more fair.

—*James B. Kenyon, in The Century.*

OF INTEREST TO WOMEN.

BASQUES still show the styles prevailing last Winter. The fronts are unusually pointed, the back postilion, and the bodice is very short over the hips.

The Philadelphia Press says that the Tonka beans will keep away moths. This is certainly preferable to camphor, which leaves an odor disagreeable to many.

A narrow pleating at the foot of the skirt, though still used, is rather out of date. The newest fancy is a bias fold set on the same way.

Velveteen street gowns will be much worn this Winter. A good quality of English manufacture, possesses great wear-resisting qualities, and is uninjured by rain or snow.

We have heard for the past year that the Jersey is doomed, but new styles are constantly introduced, and they are as much worn as ever. The newest ones have whalebones in all the seams, and an inside belt to keep it in place.

The Philadelphia Press says that a certain titled lady, while learning embroidery lost her mind and was confined in a private madhouse. But she still retained her passion for needle-work. She spent her time in joining the odds and ends given her from the scrap-bag and invariably used contrasting colors of silk, and nearly every stitch was different. Specimens of her work found their way outside of the asylum, and thus originated crazy patchwork.

The Portland Oregonian very justly tells us that Mrs. Pennington, who lives on Five Mile Creek, in Wasco County is a heroic woman. A few days ago while walking out with her two children, one three years old, the other a baby at the breast, she was attacked by a large wildcat. Fortunately she had a revolver, which she emptied into the animal, and this not putting an end to him she finally beat out his brains with a stick of stovewood. Not less heroic, although in a different way, is a woman living in Grant County. Left a widow last Winter, she has carried on the farm and cared for her children without any help whatever. When plowing time came she constructed a box on the plow in which to carry her babe, and thus she plowed the ground. She then proceeded to harrow, plant and cultivate, carrying the child on her back, and in this way has produced a fine crop, and is now engaged in carting the truck to a neighboring town and disposing of it.

ONE THING NEEDFUL.

THERE is a recent novel of this title, from the pen of a prolific writer, who has written much chaff, fairly sprinkled with solid grain. But one thing needful and that is loving sympathy, says the novelist, and who shall gainsay her? Mr. Gradgrind would doubtless prove to us, in the most lucid manner possible, that proper sustenance, proper clothing, and proper mental occupation were the sum total of our requirements. But daily life disproves this; daily we see someone with all material requirements, starving in the midst of plenty; suffering saddest heart-hunger for the sympathy that should be freely given. Nor is it always the lonely one, bereft of friends and kin. There is the wife whose husband, good, kind soul though he may be, looks upon her unsatisfied longings as womanish vapors, beneath the dignity of masculine understanding. And sadder still is the man of high aims and lofty mind, whose life companion is some shallow little creature, lovable enough in the first bloom of youth, but trying beyond measure when the roses have faded, leaving the barren little mind bare. But now and then we see some gracious woman who is *sympatica*, as the Italians say, who draws love and confidence and sympathy toward her as the sun draws the flowers. The Irish say of such a one that she has a face like a fiddle, for she draws all tenderness to the surface. Such gift is born with the possessor; yet it may be acquired. And how it brightens and lightens this work-a-day world! How shall it be acquired? Perhaps the best and only way is to forget ourselves and our own personality, by putting ourselves in the place of others. Do not think: "What shall I say to this friend who is in pain or sorrow; good report or evil report." Strive rather to feel as your friend must feel; then offer the sympathy that would appeal to you in like place. That is the secret of genuine sympathy; complete disregard of self; thought only for others.

This does not imply loss of our own personality. This very identification with others impresses us more firmly on those we influence, and how much awkwardness and *mauvais honte* it removes! Someone says that the perfection of good breeding consists in listening with courteous concern to something we have heard before, related by a person less familiar with the subject than we are ourselves. That is the very epitome of this one thing needful; the entire sympathy with others' moods that, though it may begin with conventional good-breeding, becomes the Godly grace of charity, and fulfils the injunction of the Master: to weep with those that weep and rejoice with those that rejoice!

EMANCIPATION OF WOMEN.

THE emancipation of women is pretty firmly established when Yale College (that last refuge of conservatism) signalizes her new departure by making a maiden a bachelor, and when Columbia College turns out an M. D. of the gentler sex.

It is feared that under this new *regime* of enlarged liberty for women, we shall have no more fair Juliets; no more tender Desdemonas, but these doubting ones have yet to learn that to be feminine it is not necessary to be ignorant. In the first place all women are not fair, but she will be none the less lovely if she knows enough Greek and astronomy to pass a college examination, or enough of medicine to save a life.

One effect of the many avenues of support that are now opened to women, is that matrimony is no longer their *Ultima Thule*, and

"To sit on a cushion, and sew up a seam,
And live upon strawberries, sugar and cream."

is no longer their only refuge. If the seam were only a pretense, and the cushion were always of damask and down, and we could all look as charming as the young lady in the nursery rhyme who is so employed, this might do very well, but alas! the seams are so often endless, and the strawberries and cream are so often served on Sevres; in short women have learned that it is better to provide themselves with the necessaries of life which they can earn by their own unaided labor, than to wait for the very uncertain luxuries that a possible husband will provide.

ALICE GOLDSMITH.

PIN MONEY POINTERS.

SINCE the day when our mother Eve fashioned her robe of fig leaves, matters connected with dress have never ceased to be of interest to the feminine mind. If one only could obey the Bible injunction, and without taking thought for the morrow as to wherewithal we shall be clothed, still appear as one of the lilies of the field, many a head and heart-ache would be saved:

"Through tattered clothes small vices do appear;
Robes and furr'd gowns hide all,"

is a bit of wisdom that we learn very early in this world. The struggle to make a fifty cent bonnet or a five dollar gown appear to be Parisian creations is often a severe one with women.

Any one having a scarf or a quantity of black lace can have a pretty bonnet for evening wear with very little outlay. Purchase a suitable frame and arrange the lace on it in soft folds, not in plaits or gathers. A cluster of white or pink or Jacqueminot roses (which need not be expensive) will add the finishing touch. If one has any taste she will do better to trim her own hats and bonnets, for the creations of milliners in the cheap line are not apt to be satisfactory to any but servant girls. White illusion strings are a very pretty addition to a bonnet for evening wear and will last much longer if they be neatly rolled up each time after being worn. Gloves and ribbons will do double service if they are always put away neatly, the former pulled in shape and the latter rolled up.

For party dresses for young ladies there is nothing so charming as white, and although there are comparatively few days at this season that are warm enough to make thin white dresses either safe or comfortable, there are many other beautiful fabrics in white. Gypsy cloth is the most youthful of all the white draperies, and suggesting as it does bright ribbons, one is reminded of how many different toilettes may be achieved with this same white gown and a change of ribbons. Convent cloth is a trifle heavier and has a mottle surface. Clairette combines well with velvet and lace, and will be chosen by matrons and those who wish to combine a medium degree of warmth with the freshness of a white gown. It has a lustre like reflected moonlight, is smooth and opaque and falls in stately folds. Feather cloth, as its name implies, falls in soft folds. It combines well with satin. Any of these goods are economical as they will dye when the wearer is tired of them, and will make that indispensable portion of a lady's wardrobe—a light weight black gown that will not catch dust or grow rusty.

If, however, a young lady would appear well in the eyes of the man whose bright particular star she is or is to be, let her pay as much attention to her morning toilette as to that which she wears on the street or in the evening. It is said that the most favorable time to judge of a woman's character is in the morning. If she looks well then, she is in good health, if she dresses well, she is tidy. If she plans and executes a reasonable morning's work, she has mental and bodily activity. Beware of the young lady who gets up to a late breakfast, which she languidly eats in a faded and untidy gown, with her hair in curl-papers, and her slippers down at the heel. She may appear a radiantly beautiful being in the evening, but it will hardly atone for the fact that she is an unpleasant object to contemplate in the morning, when you consider how many mornings go to make up a life.

There are so many pretty cotton fabrics that one need not be at a loss for charming morning dresses. The pleated and belted jacket or the baby waist fitted over a tight lining are suitable for these goods. Almost any style of dress is preferable to the hideous "Mother Hubbard" which is never pretty on a child over eight, is ludicrous on a girl of fifteen, and reaches the hight of absurdity on a woman of fifty.

For those who can afford to wear them, a handsome Jersey waist is a great addition to a wardrobe. Beaded, they add richness and elegance to an otherwise plain toilette. It is poor economy to buy them already beaded, as the cheaper variety is used for this purpose, and a waist that could be had for a dollar, if beaded will cost ten. The better plan is to get a really good article, and then bead it yourself, the cost of the beads being a very slight one, and the time required being very little more than will be needed to fasten the loose beads on one already beaded.

A jersey that is past service on account of worn sleeves may be made to do good service again by putting a double row of lace up the outside of the elbow, and a jabot of lace down the front if the latter is at all worn. Simulate a vest by placing little loops of beads down the fronts, and no one will imagine your lace and beads are only employed to hide the ravages of time. SELMA CLARE.

GOLDEN GRAINS.

RICHTER says: "Every man has a rainy corner of his life, out of which foul weather proceeds and follows after him".....

JUST as every stroke of the sculptor helps to bring the angel out of the marble, so every thought, feeling and purpose of our souls today contributes something to the beauty or deformity of our resurrection bodies.....

REV. A. K. BOYD says: "You have been thinking well of yourself and your doings, when all of a sudden your little scaffolding of poor sticks breaks under you, and you see with a dismal clearness what a sorry thing you have made of it all, what miserable mistakes you have blundered into, what inexpressible follies, worse things than follies, which bow you down, and (in brief) what a poor creature you are.....

"I SAY to you, Welcome this fresh and startling view of things; turn to spiritual account this painful exercise which your soul is passing through. Do not take the heavy stripe and be none the better for it. You will bear this in quite a different spirit than you have possibly known till now, if you resolve that it shall serve, it shall leave you spiritually bettered; it shall be a humbling, trying, painful, yet searching and effective means of grace."

ACCUSTOM yourself to think vigorously. Mental capital, like pecuniary, to be worth anything, must be well invested—must be rightly adjusted and applied, and to this end careful, deep and intense thought is necessary if great results are looked for. There is no such thing as standing still in this world. Change is the eternal law of nature.....

BEAUMONT says: "As the deepest hate may spring from the most violent love, so the greatest ingratitude may arise from the largest benefits. It is said that Cicero was slain by one whom his oratory had defended when accused of his father's murder."

WE should love and seek the companionship of those who critisize us kindly, and advise us, rather than those who flatter and praise us .....

BE very moderate in sleeping; for he who does not rise with the sun cannot enjoy the day; and observe, O Sancho, industry is the mother of prosperity, and laziness, her opposite, never saw the accomplishment of a good wish.—*Cervantes*.....

THE Church Press says: "Somebody has discovered that Boston people like Broad Churchmen whose sermons are not flat; Philadelphians like preachers whose thoughts are deep and well rounded, and New York likes a square man with no frills about him, who can say it all in about 20 minutes."

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

WHY NOT?

A FARMER living near the Rural Grounds is often assisted by his daughters in gathering vegetables for the market. Before they go out in the sun they draw old stockings over their hands and arms, with holes cut in them for the thumbs and the toes cut off to give the fingers freedom. These improvised mitts save their hands from burning and tanning, and from scratches and stains. Farmer folk, both the women and the men, are apt to neglect their personal appearance. They show a lack of proper self-respect by allowing their finger nails to go untrimmed and uncleaned, and the hands to go half washed; boots are worn muddy and unblacked, collars are kept for extra occasions, and even smooth hair is considered too good for everyday. Such carelessness is too often looked upon as a badge of independence, and any efforts to improve made by one member of a family subjects him to endless ridicule or unkind contempt. He is called "high-toned," "stuck-up," "fussy," and finds that his efforts toward even the simplest refinements are made needlessly hard. A love of personal neatness and of becoming dress for every day should be encouraged, and any extra work necessary to make such habits and such dress possible should be considered well directed work.

BABY AMUSER.

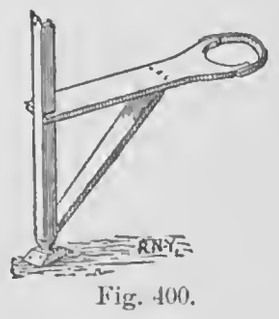

Fig. 400.

THE above contrivance I have found useful as a baby tender, keeping the little things out of mischief, while it prevents them from falling while learning to walk. The post is fastened into blocks above and below, and revolves around and around. The piece extending horizontally should be secured at a hight that will enable baby's arms to be just above the hoop while his feet touch the floor. Of course the "tender" must be firm, so that there is not the slightest danger of its falling upon the child. MRS. S. P. ADAMS.

WELSH RARE-BITS AND SUNDRY CHEESE COURSES.

THE best cheeses of France are *fromage de Brie*, which takes its name from the place where it is made, Roquefort and Neuchatel; Stilton and Cheshire are the most celebrated English cheese. Immense quantities of American cheeses are imported to England, and are considered great luxuries by epicures there. A taste for Stilton and Roquefort is generally an acquired one. The former is made by adding the cream of the preceding evening's milk to that of the morning's milking, producing a very rich and creamy quality. Roquefort is made from a mixture of sheep's and goat's milk. Parmesan, an Italian cheese, is made of skimmed milk, is not sent to market until it is six months old, and is frequently kept for three or four years. It is used in great quantities grated for cooking. Much of that sold already grated in bottles is largely

adulterated with Indian meal. Otsego County, N. Y., has acquired a reputation for the excellence of its cheese. Swiss cheese of a very superior quality is made near Los Gates, in California. A favorite plan with epicures is to cut the top from a Stilton cheese, hollow out a small space in the center, fill it with Port wine, replace the top and set it away. This is refilled with wine periodically for several months. The result is a very rich article warranted to produce indigestion in 24 hours. If served plain this cheese should have the top cut off, and the cheese neatly surrounded with a napkin. When taken from the table the top is replaced. No bit of dried cheese should ever be thrown away as it can be used for omelets, or grated for maccaroni. Thin milk crackers or wafer biscuits (put into the oven a moment before serving to crisp them) are served with cheese. The English serve celery or cucumbers with it, and a very delightful combination they make.

Welsh rarebit is a difficult course to serve at dinner unless you have well-trained servants. It should not be made until it is almost ready to serve and should be eaten the moment it is finished or it will be ruined. It is a very nice supper or lunch dish. Grate one pound of rich new cheese and mix it over the fire with a gill of milk, stirring it smooth with a spoon. Meantime toast carefully a dozen thin squares of bread with the crust removed, butter them slightly, and pour over the melted cheese. The addition of a little mustard powder or Cayenne pepper is considered a great addition by some. Very tiny diamond-shaped pieces of this are sometimes used for decorating a platter of macaroni with cheese. Sometimes the toast is dipped quickly into hot milk before being buttered. A poached egg may be served on the top of each slice.

Cheese Straws make a delightful accompaniment to a salad. The following is the recipe of the New York cooking school. Sift six ounces of flour on the pastry board, and having made a hole in the center put into it two tablespoonfuls of cream, three ounces of grated Parmesan or any dry cheese, four ounces of butter, a half teaspoonful of salt, a quarter of a teaspoonful of pepper and as much Cayenne as you can take up on the blade of a pen-knife; mix these ingredients with the tips of the fingers to a firm paste, knead it well and roll out the eighth of an inch thick. With a sharp knife or pastry cutter cut it in straws about eight inches long and a quarter wide. Lay on buttered tins and bake a light straw color in a moderate oven. The author accompanies the recipe with the assurance that a prolonged diet of this will produce a well-grounded case of dyspepsia in a very short length of time.

CHEESE SOUFFLÉ.

This course may follow the soup directly or be served just before the dessert. Serve bread and butter with it. Heat one cup of milk, and add a teaspoonful of corn-starch dissolved in a little cold milk; then a pinch of soda and pour it very slowly over four beaten eggs; add pepper and salt by way of seasoning, two tablespoonfuls of melted butter, and six of finely grated cheese. Beat thoroughly and pour into well-buttered custard cups. Bake in a quick oven until they puff up high and brown, which will take about 15 minutes.

Pieces left from any good pastry may be utilized in this way. Roll out and cut into strips three inches long and two wide; strew with grated cheese, season with pepper and salt, double the paste upon this lengthwise and bake in a quick oven. Brush over with beaten egg just before they are done. Spread a folded napkin on a dish, pile these on in log-cabin fashion, and serve warm with celery. Not good when cold.

RAMEKINS.

Boil two ounces of the soft part of bread in a scant gill of milk, add two ounces of butter, one-third of a teaspoonful each of mustard and salt, a small pinch of Cayenne pepper and the yolks of two beaten eggs. Beat this mixture thoroughly and add the whites of the eggs beaten to a stiff froth. Make from writing paper some little cases, butter them, fill them two-thirds full and bake five or six minutes. They will be puffed high above the edge of the paper and must be served immediately or they will fall. This recipe was invented by the cook of Louis XVI. Sometimes this mixture is spread over lightly toasted rounds of bread and browned slightly in the oven.

History has left us no record of the fashion in which the cheese cakes carried by Little Red Riding Hood to her grandmother were made, but I am quite sure that they were indigestible and unfit food for the old lady, so that if she had not been eaten by the wolf, she must in course of time fallen a prey to such a diet.

Those who live in the country do not need to be told of the delights of cottage cheese with cream. Those who do not have milk may make a very good substitute by getting a couple of the cheeses sold in the market under that name. Work them over, rubbing between the hands until very fine with two ounces of butter and as much cream as you can steal from your morning's milk. Mold on a plate and, if you can get it, pour over it a gill of cream. PALMETTO.

DOMESTIC RECIPES.

FRIED CHICKEN WITH HOMINY.

CLEAN and cut in joints a young chicken. Wipe dry, season with salt and pepper, and fry in a pan in which you have previously extracted, by frying, all the fat from several slices of pork. This fat must be very hot. Cook slowly, turning frequently to prevent burning, and if any more fat is needed, add a little sweet dripping. Have ready some cold boiled hominy, cut in slices and rolled in flour: take out the chicken and place on a hot dish in the warming oven, while you brown the hominy in the fat left after frying the chicken. Place it as a border around the chicken; add a half cupful of hot cream to the gravy in the pan and thicken with a scant tablespoonful of flour wet with a little cold milk. Send to table in a boat.

We have the word of an epicure for it that very ripe, medium-sized tomatoes, dipped quickly in boiling water, peeled and placed over night on the ice, are delicious if served the next morning at breakfast with cream and sugar.

Celery cooked *a la* asparagus may be a new dish to some of the readers of the RURAL. Cut the celery in convenient and equal lengths; boil in salted water until tender, but not watery; drain and serve with white sauce. Put in a small sauce-pan a tablespoonful of butter, and when melted stir in as much flour: add a cup of boiling milk, gradually, so that there will be no lumping, season with pepper and salt and pour over the celery. It can also be cut in half-inch pieces, put in a baking dish sprinkled with grated cheese, and baked with the above sauce poured over it.

AUNT EUNICE.

ENGLISH PLUM PUDDING.

HERE is a recipe for the real old English plum pudding, and everything appertaining thereto.

There are a few general rules for all boiled puddings that any one attempting to make a plum pudding should understand. If boiled in a mold it should never be more than two-thirds filled, and the cover must fit so tightly that no water can enter. If a bag or cloth is used, it must be thoroughly soaked in hot water, then wrung out and the inside dredged with flour. If this is done, and the bag plunged in cold water for a second after it is removed from the fire, it will turn out of the cloth without sticking. Plum pudding wants plenty of water to swim about in; therefore the vessel must be large and contain plenty of *boiling* water when it is put in. The water must boil the whole time, otherwise it will soak into the cloth and make the pudding heavy, and as the water boils away it must be replenished from another kettle of *boiling* water. If cold water is used it will be certain to make it heavy.

Armed with this knowledge, you may proceed as follows: Chop one pound of suet very fine, and mix it with three-quarters of a pound of bread crumbs, half a pound of flour; 1½ pound of raisins, stoned, one pound of Zante currants, washed and dried, and half a pound each of orange peel and preserved citron cut into shreds; stir all these well together with half a grated nutmeg and ten eggs well beaten. If boiled in a bag, leave a little room for it to swell. Boil it for six hours, ornament with holly, pour brandy around it, and set fire to it as soon as placed on the table.

The French have always viewed this national dish of England with disapprobation; but Louis XVIII., either to show his contempt for the prejudices of his countrymen, or because it suited his taste, always had an enormous plum pudding served up on Christmas Day.

An amusing story is told of one of the French monarchs, who, desirous to treat the English Ambassador with particular hospitality on Christmas Day, ordered a plum pudding for the entertainment given in his honor. He strictly charged his cook to follow in every particular the excellent recipe which he had obtained for making one, all of which directions were well attended to. But one trifle was wanting; the king forgot the cloth, and the pudding was served in a tureen like so much soup. ALICE G.

CHRISTMAS PLUM CAKE.

A CHRISTMAS cake should be made in October as it is vastly improved with age. Beat to a cream one pound of butter and one of pulverized sugar; stir in twelve eggs beaten to a froth; add one pound sifted flour and continue the beating for ten minutes. Now stir in two pounds of stoned raisins, two pounds of Zante currants, washed, picked and dried, a pound of citron sliced and cut into small pieces, two grated nutmegs, a quarter of an ounce of powdered mace, the same of ground cinnamon, and half a teaspoonful of ground cloves. Mix well together and bake in pans well and and smoothly lined with three thicknesses of tissue paper well buttered. Bake in a slow oven for four hours. MRS. L. G. M.

Chicago, Ill.

WHAT OTHERS SAY.

DR. J. W. KALES who has had considerable experience with the so-called victims of poisoned ice-cream, has come to the conclusion that the sickness is due not to poisonous matter in the cream but to the manner in which it is partaken. He says that every law of digestion is violated at the so-called "ice-cream" festival. Every fellow takes particular delight in gorging himself and his "best girl," not only with ice-cream, cake, candy, etc., but with every variety of indigestible substance. This process goes on for two or more hours, when outraged nature comes to the rescue and the indigestible matter is expelled with all the symptoms of acute gastro-intestinal irritation. It only excites the public because so large a company are sick at the same time. He has also seen isolated cases, presenting exactly the same symptoms, caused by eating oysters and other food and drinking ice-water. He thinks that if the poisoning was the result of vanilla extract we would have cases caused by drinking soda water, vanilla being a popular flavor. He also asks why we do not have cases at fashionable hotels where cream is served every day.

To know one subject in a masterful way will move you forever from the ranks of uninteresting or uneducated people, Louise Manning Hodgkins says in the Christian Union in an interesting article addressed to the girl who cannot go to college. In electing a study to pursue at home take that which gives most delight and fill yourself full of it.

IN speaking of the Wilson Strawberry, E. P. Roe, in Harper's Monthly, says that it is not ripe when red, and therefore is rarely eaten in perfection, but if allowed to get almost black in its ripeness, it is one of the richest berries in existence. He thinks that with a liberal allowance of sugar and cream it makes a dish much too good for an average king, and that it also is the best variety for preserving.

THE Housekeeper is of the opinion that it is not sufficiently recognized that clothes have a moral influence in addition to their effect upon the eye. The woman or child who is well dressed experiences a sense of moral elevation, an added self-respect, besides the pleasure of appearing becomingly arrayed. It further adds that lavish expenditure is not necessary for tasteful apparel.

WE don't advise anyone to work for an hour or more in the morning on an empty stomach.

Neither do we think anyone should work in the evening after being busy all day.

Two things children can't stand—nagging and discouragement.

Doctors Prescribe

Ayer's Cherry Pectoral, for three reasons:—it is perfectly safe for old or young,—can be relied upon in cases of emergency,—and possesses great curative powers.

I consider Ayer's Cherry Pectoral a medical success and a chemical triumph. I have found this medicine a powerful specific for Colds, Coughs, and Pulmonary Complaints. I use it in my own family and recommend it in my practice.—Parker Cleveland, M. D., Prof. of Chemistry and Materia Medica, Bowdoin College, Brunswick, Me.

Ayer's Cherry Pectoral is an invaluable remedy for Colds, Coughs, and all Pulmonary diseases. I use it myself and prescribe it in my practice.—A. S. Pettenger, M. D., Glen Gardner, N. J.

Ayer's Cherry Pectoral,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. L. S. Johnson & Co., P. O. Box 2118, Boston, Mass

News of the Week.

HOME NEWS.

SATURDAY, October 16, 1886.

REPORTS from different sections of Berks and neighboring counties in Pennsylvania indicate widespread damage by drought, which is the severest for over twenty years..... .....The condemned Chicago Anarchists are senteneed to be hung on Dec. 3. Money is being raised to carry their case to the Supreme Court of Illinois, and eveu to the U. S. Supreme Court if necessary. The K. of L. are reported to be disposed to take action in their behalf. Other Anarchists still at liberty are violent in their denunciations of the sentence and in their threats against the Judge who presided at the trial, the lawyers who prosecnted the malefactors, the witnesses who testified against them, and the jury who brought them in guilty. This violence is injuring any chances the condemned may have.....After all, it appears by the latest report that Geromino and his band surrendered unconditionally as prisoners of war, and were distinctly told they must trust for clemency to the President. Arizonians warmly praise Miles—Next report! ....After all, it seems by latest accounts, that a draft of a treaty between this country and the British Empire, including Canada, was submitted to the Dominion Government several weeks ago, and over 40 objections were made to it, chiefly on account of the articles mentioned in the free list. Canadians have invested over $10,000,000 in manufacturing woolen and other fabrics, and a great deal in agricultural machinery works, and they can't compete with this country in any of these industries; hence they crave "protection."....The other day Captain Quigley, of the Canadian cruiser Terror, hauled down the American flag on the schooner Marion Grimes after the captain had hoisted it a second time in face of a caution not to do so. The vessel had been seized for alleged smuggling and was in Canadian custody. Our cutter Corwin on seizing the British sealing vessels in Alaskan waters, at once hauled down the British colors. Captain Quigley's over-zeal, however, is to be officially reprimanded. Much spread-eagle bluster about the Stars and Stripes. Too much "big-head" all around. ....The Standard Oil Company, Wednesday, absorbed the Raccoon Oil Company and its 7,000 acres of oil and gas territory at Shamokin, Pa., together with several large oil works—amount involved $2,000,000. The S. O. Co. will soon have a complete monoply of the oil business in the country. The Cotton Oil Trust Company, the great Southern monopoly, is run on the same monopolizing principles, and, it is said, by the same men... .....Governor Warren, of Wyoming Territory, dolefully complains that immigration is very seriously checked there by the efforts of the Land Office to prevent dishonest appropriations of the public domain by the cattle kings, land syndicates, etc. Secretary Lamar says land entries there amounted to 3,512 for the fiscal year ending June 30 last, against 2,923 for the preceding year.....Governor Stevenson, of Idaho, says that during the year the Territory has rapidly increased in wealth and population—crops and mining good. Apples, peaches, pears, nectarines, apricots, plums, prunes, grapes and all of the small fruits are produced in great abundance and of a quality unsurpassed. Chinese labor is one of the greatest evils .....Over 20,000 cigar makers on strike or locked out in Cuba. Highway robberies and assassinations of daily occurrence. Open violence feared.....The eleventh annual convention of the mutual benefit associations of America will be held in St. Louis on October 19, 20, 21 and 22, for the purpose of remedying abuses, affording mutual protection against fraud, and establishing a correct standard of rates.....Commissioner Colman is experimenting with silk reeling machinery.....Headquarters of the Department of Dakota have been changed from Fort Snelling, Minn., to St. Paul, same State, about six miles.....A new Board to decide appeals from the decisions of the Commissioners of Pensions is to be established at Washington. ..The baseball season closed last week. The interest in the game has been greater than ever. In the League Chicago again won with Detroit a close second, and New York third. But for several accidents to players the Detroits would undoubtedly have won. The New Yorks disappointed their patrons. The club has played in a lazy, half-hearted fashion. In the rival organization, the Association, St. Louis again won easily. It is generally thought that the St. Louis club is the strongest baseball aggregation ever brought together. A series of games between Chicago and St. Louis has been arranged..... .....N. M. Neeld, a partner in the well-known pork-packing firm of J. C. Ferguson & Co., Chicago, has joined the crowd of other dishonest rascals in Canada. He raised $400,000 on bogus receipts for pork, meat and lard, supposed to be stored in ware-houses. The amount there was worth much less; and what there was he sold a week before his flight to different people over and over again, and got the money. Has burst up his firm, capital $200,000. Loss will be confined to the banks that trusted the scoundrel, who lost most of the boodle in speculation.....A cliff of "as good glass as any ever made" has been discovered in the Yellowstone Park, half a mile long and from 154 to 200 feet high—an obsidian variety of volcanic lava....Queen Regent Christina of Spain has signed a decree liberating all the slaves in Cuba. The first move toward abolition was made by a law in 1869, which provided for the conditional liberation of certain classes. The law of 1879 freed at once all slaves 55 years old and over, and was gradual in its action, all bondsmen between 35 and 40 to be freed this year, while complete emancipation should take place in 1890, so that this decree anticipates by four years the date of general emancipation. The owners have received from the Spanish Treasury the liberal recompense of $350 for each slave. About Manistee, Mich., an oil fever, similar to the craze formerly common in Pa. is raging violently. While sinking a well for salt, R. G. Pellars, about 10 days ago, struck a 600-barrel-a-day flowing petroleum well "at a depth of several hundred feet." Land has gone up with a rush; speculators flocking in; operations on an extended scale begun..... .....The 1,000 delegates of the Knights of Labor talked all the past week also, and haven't finished yet. The Home Club of this city—the faction antagonizing trades unions, and the "machine" of the organization—has gained the ascendency, having elected a majority of the executive officers—Powderly, as Chief Master Workman among them—and increased their terms from one to two years. Much clap-trap talk, as if they really represented all the toilers in the country. Their expenses are $5,000 a day; their parade cost $5,000; the organization pays for it all.... ... Catholic Archbishop Elder of Cincinnati proposes to pay a part of the $4,000,000 Archbishop Purcell, his predecessor, together with his brother, Rev. Edward Purcell, lost some years ago in very reckless and wickedly foolish fashion, after the money had been intrusted to their care by the Catholics of the diocese—chiefly poor, credulous Irish. He lent much of it at six per cent., without security, and lost of course. Churches and schools were built in whole or part with some of it; and the creditors insist that these should be sold to partially pay the indebtedness. The Archbishop won't do this; and the creditors still grumble. ....Colonel Orlando B. Wilcox, 12th Infantry, has been made Brigadier-General, *vice* J. H. Potter, retired—a good old soldier.....A terrible storm Tuesday night did a world of damage along the Gulf coast, especially in La. and Texas. Sabine City, a small village at the junction of Louisiana and Texas, has been swept away by high tide driven in from the Gulf and consequent back water from the Sabine and Neches Rivers. Only two houses left standing and over 100 persons drowned—nearly the entire resident population—55 colored. The settlement of Bayou Johnson, La, was completely submerged, and over 20 persons were drowned. Nearly the whole La. and Texas coast is only a few feet above high water, and on most of it the water rose 10 to 12 feet. Vast numbers of cattle and hogs feeding in the swampy lands were drowned. Many isolated families, colored, creole and poor whites, must have perished. Loss in Plaquemine Parish, La., alone, over $500,000. Galveston and all the other sea coast Texas cities suffered severely..... .....About Sunday another storm developed in Utah and moved east, and still another in the extreme Northwest, moving south. Wednesday all three reached the Mississippi Valley where they were abreast. Wednesday night they seemed to have bunched their forces near Davenport, Ia., and a mighty storm moved eastward doing an enormous amount of damage in Chicago, Detroit, Milwaukee and all the intermediate country. Then it swept on to the lakes where it is supposed to have wrecked many vessels. Toledo, Cleveland, and other lake cities suffered greatly; but Buffalo at the end of lake Erie, has been most greviously afflicted. The driven waters piled up many feet, wrecked the low part of the town, while the hurricane knocked down unstable buildings and did a great deal of other damage. Six lives known to have been lost there, and several at Detroit and other places. The track of the hurricane is lost this morning, as all the telegraph wires are down; but it supposed to be raging along the St. Lawrence Valley, especially in Canada..... ....The boodle aldermen of this city are likely to find out that Broadway bribery leads to Sing-Sing. Here is the present status of the Board of Aldermen of 1884:

In Canada—Henry L. Sayles, Charles Dempsey, Robert E. De Lacey.
In Germany—Thomas Rothman
On the way there—Rudolph A. Fullgraff.
In Sing Sing—Henry W. Jaehne.
Dead—Michael F. McLoughlin, Patrick Kenny.
Innocent—Hugh J. Grant, John C. O'Connor, jr.
Out on $40,000 bail—Thomas Cleary, Michael Duffy, William P. Kirk, Arthur J. McQuade, Francis McCabe Patrick Farley, William H. Miller, John O'Neil, Charles H. Reilly, Thomas Sheils, Frederick Fink, Louis Wendel, James Pearson.
In the House of Detention for Witnesses.—Charles B. Waite.

Sayles out on bale of $25,000, was to be tried last Monday, but fled to Canada, and his brother, his bondsman, at once transferred all his property. The bail is forfeited, but there's nothing to seize upon. The courts are constitutionally obliged to release a prisoner on reasonable bail, except in capital cases; but the bondsman can transfer all his property five minutes after he has gone bail. The other boodlers who were out on $25,000 bail were rearrested, and $40,000 bail was required. All have given it, but why can't their bondsmen do as did Sayles' brother? The bribers also are likely to be indicted soon..... .....A great fire at Eastport, Me., yesterday, destroyed hotels, factories, government buildings, insurance records, many stores and dwellings, etc. Loss now estimated at $500,000.... .... Great strike of railroad switchmen is blocking all freight business at Minneapolis. Five mills already shut down for want of wheat; others to follow if strike continues. Much loss and inconvenience to farmers and others along the railroad lines as transportation of goods is entirely suspended.....

FOREIGN NEWS.

SATURDAY, Oct. 16, 1886.

THE Bulgarian embroglio still "holds the field" in European interest, and is the only complication of real interest to agricultural America, as the prices of our agricultural products can be seriously affected by the outcome. The elections for members of the Great Sobranje, which is to elect a successor to Alexander, has resulted in an overwhelming victory for the government, and a humiliating defeat for the adherents of Russia. As a result, Russia is said to have informed the Powers that the immediate occupation of Bulgaria is necessary, and has tried to effect a combination of France and Turkey against England and Austria, one of the terms of which was to be the occupation of Egypt by a Turkish garrison under a French general. This combination is said to have failed. Austria insists no election of a Prince must take place till the Powers have agreed upon the man, so that Bulgaria will merely have to endorse their decision..... Meanwhile the general aspect of affairs in Europe is anything but peaceable. In Germany, France, Austria-Hungary and Italy the government arsenals and manufactories are running day and night to convert army rifles into repeaters of the most improved and deadly fashion. Boulanger has secured an appropriation of $25,000,000 for the manufacture of vast bombs to hurl shells containing a new explosive the composition of which is a State secret; but which, it is claimed, is more terribly destructive than any hitherto discovered. Whole regiments are to be destroyed by single discharges. Germany is straining every nerve to keep ahead or abreast of France. Never was the latter in better condition for war. She can put 3,000,000 trained troops into the field armed with guns of destructive power, and tremendously encouraged, if not inflated, by Boulanger's words, actions and untiring energy. It is doubtful whether her fleet is not a match for that of England. She seems aching for a fight. The other great powers, however, especially Germany, are just as well prepared, except England, whose army is almost insignificant in numbers; and about the efficiency of whose fleet grave doubts have just been published by Admiral Lord Seymour and other naval authorities, native and foreign. There is no peace in Europe—merely an armed truce..... ...

AGRICULTURAL NEWS.

SATURDAY, Oct. 16, 1886.

GERMANY has prohibited the importation of poultry from Russia. Chicken cholera has been spread from previous importations..... An English farmer has been fined $25 and costs for keeping 150 sheep three days on a worn-out pasture without food....No contagious pleuro-pneumonia in Canada—it is claimed. ....Nothing yet done with the quarantined cattle at Chicago. Disease supposed to be in several other herds besides those at the distilleries. Great fear that it will spread, as farmers and graziers are foolishly buying dairy and beef stock in the Chicago market and spreading them over the country. The dilatoriness of the authorities is greatly injuring the live stock trade of the city, and unless amended promptly is likely to damage it for years.....About 20,000 meat packers are out on a strike for eight hours' work a day at Chicago. They are all pork-butchers except 1,200 beef-butchers employed by Armour, against whom the feeling is most bitter. Over 400 armed Pinkerton detectives are guarding the packeries; but no violence has hitherto been attempted. Two delegates were sent by the Knights of Labor from Richmond to try to compromise, but the packers refuse to treat with them as a body; and in any case insist on the right to manage their own business. The beef-packers in the 21 other packeries will probably strike on Monday. The Knights of Labor threaten to boycott Armour's goods throughout the country. Both sides very obstinate, strike likely to last two or three weeks or more. Packers offering large inducements to men from other places. Armour has 600, and will begin to work when he can get more. Serious rioting likely if scabs are employed. . .....Prices of hides low—100,000 foreign sold last week in Boston.....Freight on live cattle across the Atlantic now ranges from $7 to $10 per bullock, and insurance rates are three per cent .....The latest London cablegram reports American cattle better in English markets at 13 cents per pound estimated dressed weight. The trade is very dull, however, as European markets are overstocked... .....Boston exported to England last week 959 live cattle and 2,702 quarters of beef..... ....In conducting public sales in England the auctioneer inverts a sand glass at each bid, and if another bid is not made before the sand runs out, the animal is knocked off to the last bidder.....Less transfers of range stock have been made within the present year than for some years. Range marketing has been unsatisfactory and investments correspondingly unattractive. .....Oleomargarine stamps, now being printed, must be used after November 1.....The recent heavy storms in the gulf have caused a loss of over $200,000 to the rice growers of the Lower Mississippi by blowing the water inland, inundating the small rice farms five or six feet and washing away the stacks of rice, which had been an unusually good crop this year..... .....A contagious disease among horses about Canton, Ill., "like contagious pleuro-pneumonia among cattle"—a "complication of catarrhal fever and influenza," that ends generally in death ..Michael F. Battelle, of Minnesota, has been appointed Register of the Land Office, at Fargo, Dakota..... .... ..Most extensive and destructive prairie fires ever known are sweeping over the prairies in the Indian Territory. Millions of acres of splendid pastures, a charred waste. Large numbers of cattle burned to death. Immense amounts of baled and loose hay intended for winter feed, destroyed. Area burnt extends from Vinita on the north, to Muskogee on the south, and on either side of the Missouri, Kansas and Texas Railroad as far as the eye can see.....The Louisiana and Federal Governments are to divide the expense ($100,000) to close the Morganza crevasse, two miles wide, the largest break in the La. levees, by which over 3,000,000 acres of fertile land have been inundated for over two years..... ....Detectives acting under orders from State Inspector Newton of New Jersey, have been quietly securing evidence in relation to the sale of oleomargarine in New Brunswick. The other night they made a raid and secured conclusive proof against over 20 dealers..... .....Average price for Colorado wool the season 18 cents, clip 1,000,000 pounds more than that of last year..... ....That cotton-picking machine tested last Wednesday on a cotton field near Sumter, S. C., picked cotton at the rate of 180 pounds per hour, without injuring the bolls or plants. The general opinion of those present is that the machine is correct in its principle, does fairly good work now, and can be made completely successful.. .. The Land Court constituted under the Scotch Crofters Act has been opened at Dornoch, Sutherlandshire. On the opening day about 100 persons applied to the court to fix their rents.....The Department of Agriculture estimates the supply of hogs for marketing the coming Winter at seven per cent. below the number available last Winter. The Cincinnati Price Current places the reduction at 10 per cent.....Robert L. Green, Democratic candidate for governor of New Jersey, as member of Congress voted against the Oleomargarine Bill. How many farmers will remember the act against him at the polls?.. .....The Commissioner of Agriculture is about to issue a circular to all dairymen and officers of agricultural societies requesting them to send to the Department of Agriculture monthly statements of the production of milk, butter and cheese, and urging them to take especial pains to secure accuracy in these reports, so that the Department may be en-

abled to publish more reliable statistics of the dairy industry than heretofore.....

Crops & Markets.

SATURDAY, October 16, 1886.

The report of the Department of Agriculture for October gives local estimates of yield per acre of small grains, with condition of corn, potatoes and other late crops. The results corroborate the previous returns of wheat, confirming expectations of slight increase for the first records of thrashing, without making any very material addition to the crop aggregate. The average yield upon an area of fully 37,000,000 acres appears to be close to 12¼ bushels per acre, making the crop an average of a series of years. The area actually harvested is now the principal object of exact determination. The result will vary a little from an increase of 100,000,000 bushels over the crop of last year. The State averages of principal States are: New York, 17 bushels; Pennsylvania, 13; Kentucky, 11.5; Ohio, 15.7; Michigan, 16.3; Indiana, 15.1; Illinois, 13.1; Wisconsin, 12.3, Minnesota, 12.6; Iowa, 12.5; Missouri, 12.5; Kansas, 11; Nebraska, 9.6; Dakota, 10.5; California, 11.5; Oregon, 13 5.

The average yield per acre of oats is 26.6 bushels, making a crop of over 600,000,000 bushels. The Ohio Valley averages over 30 bushels per acre, Iowa over 33 bushels, with lower yields in Missouri, Kansas and the Southern States. The Eastern States have high yields.

The barley crop averages 22.4 bushels per acre, and the product will come nearly up to 60,000,000 bushels. The average yield of the rye crop is 11.8 bushels per acre, and the product over 26,000,000 bushels.

The high temperature of September and absence of frost have improved corn crop prospects and made the expectation 22 bushels per acre, and rendered certain a crop of at least 1,650,000,000 bushels. The final averages of condition of the seven States which produce seven-tenths of the crop are: Ohio, 90; Indiana, 93; Illinois, 74; Iowa, 78; Missouri, 68; Kansas, 65; Nebraska, 73. Averages of the Eastern States are above 90, and those of the Southern States mostly between 80 and 90. The general average is nearly 80, against 95 last year, when the yield was 26.5 bushels.

The general average of October condition of potatoes is 81, against 82 last year, 88 in 1884, and 93 in 1883. The average of New York is 90; Pennsylvania, 84; Virginia, 93; Ohio, 89; Michigan, 71; Indiana, 87; Illinois, 70; Iowa, 59, Missouri, 73; Kansas, 63.

The tobacco average condition is nearly 87; Kentucky, 92; Tennessee, 90; North Carolina, 80; Virginia, 77; Maryland, 75. Cigar tobacco averages high except in Wisconsin. Since the returns frosts have seriously hurt the crop in many places.

The promise of buckwheat is for a crop slightly under average. Condition in New York and Pennsylvania, 87; which is nearly the general average.

The potato crop of the Eastern States and the Provinces, the sections from which Boston and New York and tributary markets derive their supply, averages upon the whole about as last year, according to 600 reports received by the New England Homestead. The crop in New England and New York is considerably less than last year, and is not large at the West, but this deficit is largely made up by a big yield in the Provinces. When the average of all the reports shows an acreage within five per cent. of last year's, the same yield per acre and of fair average quality, there is small basis for expecting anything more than the usual course of the market—the price being 50 cents on the average now with the usual advance to 70 cents in March.

De Long, Meyer & Co., of this city received Liverpool cablegrams as to the price of apples on Oct. 11: Hubbardstons, $3.36 to $3.48; common Baldwins, $2.40 to $2.88; good Baldwins, $3.12 to $3.84; Phœnix, $3 to $3.12; Greenings, $2.64 to $2.88; Northern Spy, $2.88 to $3.36; Kings, $4.80 to $5.28. In the week ending Oct. 9, 6,909 barrels were shipped from New York to Liverpool, and 14,306 from other ports to Liverpool; 346 barrels left New York for London and none for any other port. For Glasgow 3,100 barrels left New York, and 1,086 left other ports, making a total export of 25,747 barrels for the week. From the opening of the season 96,864 barrels have been shipped from all ports, against 82,215 barrels to the same date last year. The rate of freight on apples now is 2s, 6d, or about 60 cents per barrel.

MARKETS BY TELEGRAPH.

SATURDAY, October 16, 1886

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 1¼c. lower; No. 2 Spring, ⅝c. higher. Corn, ½c. lower. Oats, ¼c. lower. Rye, steady. Flaxseed, 1½c. lower. Pork, 22½c. lower. Cattle, poorer sorts a trifle higher; best a shade lower. Hogs, from 5c. to 20c. lower. Sheep, steady.

WHEAT.—Sales ranged; October, 71@72¼c; November, 72¾@73⅝c; December, 74⅛@75¼c; May, 80¾@82⅛c; No. 3 Spring, 71¼c. CORN.—Firm; Cash, 34¼c; October, 34⅝@35⅛c; November, 35¾@35⅝c; December, 36¾@37c; May, 40⅝@41¾c. OATS.—Steady; Sales ranged; No. 2 Cash, 21@21¼c; October, 24½@24⅝c; November, 25⅛@25¼c; May, 30⅝@30⅞c. RYE.—Quiet; No. 2, 48c. BARLEY. Quiet; No. 2, 52c. FLAXSEED.—No. 1, $1 00¼@1 00½. MESS PORK.—Sales ranged; Cash, $8 97½@9 00; October, $8 90@9 00; November, $8 90@9 00; January, $9 87½@$10. LARD.—Sales ranged: Cash $5 75; October, $5 70@5 75; November, $5 75@5 80; January, $5 95@5 97½. Short Ribs.—Cash, $6 70. Boxed Meats.—Dry salted shoulders, $5 40@5 45; Short clear sides, $6 65@6 70. CATTLE.—Market Steady; Shipping steers, $3 40@5 20; stockers and feeders, $2 00@3 25; cows, bulls and mixed $1 50@3 00; bulk, $2 20@2 50; cows, $2 30@2 60; steers, $3 00@3 40. Western rangers, lower; natives and half breeds, $3 00@3 85; cows, $2 40@3 15; Wintered Texans, $2 30@2 65. HOGS.—Market slow; Rough and mixed, $3 50@4 05; packing and shipping, $3 75@4 50; light weights, $3 50@4 35; skips $2 25@3 75. SHEEP.—Market steady; Natives, $2 25@4 20; Western, $3 50@3 90; Texans, $2 25@2 75; Lambs, $4@4 75.

BOSTON.—APPLES.—King, $1 75@2 25; Baldwin, $1 37@1 50 per bbl; Hubbardstons, $1 50@1 62; Harvey, $2 00; common, 75c@$1 00. BUTTER.—Northern creamery, extra, 28@29c; do. firsts, 24@26c; Western creamery, extra, 27@28c.; do. firsts, 25@26c; do. choice, 20@21, dairy, Franklin County, finest, 27@28c; good to choice, 24@26c.; Vermont extra, 28@29c; Northern, choice, 24@26c; do. fair to good, 14@15c., Western dairy, good to choice, 12@13c; imitation creamery, extra, 14@16c; ladle-packed, choice 12@13c; do. fair to good, 10@12c. BEANS.—Choice pea, Northern hand-picked $1 80@1 85 per bushel; do. do. New York, choice, hand picked, $1 70@1 75; do. do, screened, $1 80@1 85; medium choice, hand-picked, $1 60@1 65; do choice screened, $1 20@1 40; Yellow Eyes, choice, $1 50@1 55; do. flat, $1 45@1 50; Red Kidneys, $1 75. CHEESE.—New York extra, 12c; do. good to choice, 10@11c; do. common, 7@9c; Vermont extra, 11@12c; good to choice, 10@11c; common, 7@9c; Western extra, 11½@12c. do. fine, 9@10c; common, 6@8c. Sage, extra, 12@12½c. EGGS.—Near-by and cape, 25c. per doz: Eastern extras, 23@24c; Aroostook County, 22c; New York and Vermont, 22@23c; Western, 15@20c; Provincial, 16@20c. CORN.—High mixed, 54c; steamer yellow, 53c; steamer mixed, 52½c.; and no grade, 51½@52c. per bush. as to quality. HAY AND STRAW.—Choice hay, $13@19 per ton; fair, $15@16; ordinary, $14@15; fine, $13@16; Swale hay, $10@11; poor, $10@13 50 per ton; Western choice, $10@17; do. fair to good, $15@14 50; rye straw, $16@17 per ton; do. do. machine, $12@13 per ton; oat straw, $8 00@9 00 per ton. POTATOES.—Early Rose, 40@55c; Beauty of Hebron, 58@63c. Sweet Potatoes.—Virginia Yellow, $1 75@2 50 per bbl: Jersey, $2 75@3 00 per bbl. SEEDS.—Clover, West, 9¾@10¾c. per lb; Norrk, 10¾@11c; do. white, 18@26c; do, Alaska 12@15c; red top, per sack, West, $2 25; do, Jersey, $2 30@2 50; Hungarian 90c@$1 00; Millet, 90c@$1 00; Orchard, per bush, $1 50@2 00; Blue grass, $1 40@1 60; Timothy, Western, $2 15@2 25; do, Northern, $2 25@2 40; American Flaxseed, $2 25.

ST. LOUIS.—Compared with cash prices last week, No. 2 Red wheat is ½c. lower. Corn, ⅛c. lower. Oats, ¼c. lower. Butter, creamery, 2c. higher; dairy, steady. Pork, 7½c. lower. Cattle, a shade higher. Hogs, 10c. higher. Sheep, from 10c. to 30c. lower.

WHEAT.—Active; No. 2 Red, Cash, 73½c; October, 73½c; November, 73½@74c. CORN.—Lower; No. 2 mixed, Cash, 32¾@33c; October, 33c; November, 33¼c. OATS.—Firm; No. 2 mixed, Cash, 25¾@26c; October, 25¼c; November, 25¼c. RYE.—Steady at 48½c. BARLEY.—Unchanged. BUTTER.—Creamery, 24@27c; dairy, 16@21c. EGGS.—13c. FLAXSEED—93c. CALVES.—Grassers, 284 lb, at 2½c; do. 223 lb, 2¾c; Veals, 110 lb, at 7¼c, Grassers, 365 lb, at 2½c; Veals, 110 lb, at 6c; do, 136 lb, at 5c; Grassers, 197 lb, at 1¾c; Grassers, 216 lb, at 2¼c; Veals, 152 lb, at 7¼c; Fed Calves, (few Veals) 267 lb, at 4c.

SHEEP AND LAMBS.—Total for six days 40,907 head against 45,526 head for the same time last week. Northern Canada Sheep and Lambs, 70 lb, 5¾c, Northern Canada Lambs, 69 lb, at 6c; do, 68 lb at 6¼c; State Sheep, 73 lb, 4c; State Lambs, 91 lb, 5½c; State Bucks, 101 lb, at 3c; State Sheep, 123 lb, at 4¼c; Western do, 88 lb, at 4¼c; Michigan do, 80 lb, at 4¾c; Pennsylvania do, 95 lb, at 4¾c; State Lambs, 78 lb, at 6c; Western Sheep, 92 lb, at 4¼c; Pennsylania do, 98 lb, at 4½c; do, Lambs, 60 lb, at 5½c; Northern Canada 79 lb, at 4c; Canada Lambs, 84 lb, at 6¾c; Kentucky Sheep, 101 lb, at 4½c; Ohio do, 70 lb, at 3½c. Jersey Ewes, 129 lb, at 4¼c, Ohio Sheep, 81 lb, at $3 85, Kentucky do, 107 lb, at 4¾c; Kentucky Lambs, 69 lb, at 5¾c; do. 69 lb, at 5¾c; Indiana Sheep, 97 lb, at 4 70; Pennsylvania Sheep and Lambs mixed, 75 lb, at $4 05; Kentucky Lambs, 64 lb, at $5 65; Kentucky do. 106 lb, at 4¼c; Indiana Sheep, 91 lb, at 4¼; Ohio do. 85 lb, at 4c.

HOGS.—Receipts for six days, 41,368 head against 33,836 head for the same time last week. Very little doing and feeling steady. A bunch of 20 Rough Hogs, 190 lb, average, sold at $1 per 100.

PRODUCE COMMISSION HOUSE
ESTABLISHED 1865.
S. H. & E. H. FROST,
100 PARK PLACE, N. Y.
Shippers desiring to favor us will be furnished stencils, shipping cards, etc., on application. Promptness guaranteed. References, RURAL NEW-YORKER, Irving National Bank, etc.

PEARSON'S FERTILIZERS.
High Grade. Reliable. Lasting.
Manufactured in dry condition, thereby assuring full weight of fertilizing material. Most flattering results where used side by side with other preparations. Where there are no agents for these Fertilizers, orders direct to the manufacturers will receive prompt attention. JOHN M. PEARSON, Hudson, N. Y.
Send for catalogue.

RICHMOND CHAMPION FENCE MACHINE
Patented Nov. 24, 1885.
Surpasses all other wire and picket fence machines for making strong and durable fences in the field that no stock will break down. On rough, hilly ground, it keeps pickets perpendicular which no other machine will do without constant adjustment. It is easy to handle, uses any kind of pickets, and any size of wire. Write for circular and price
WAYNE AGRICULTURAL CO., Richmond, Ind

A NEW INVENTION!

RUNS EASY. NO BACK-ACHE!
7½ Cords of Beech have been Sawed by one man in 9 hours. Hundreds have sawed 5 & 6 cords daily. "Exactly" what every Farmer and Wood Chopper wants. First order from your vicinity secures the Agency. Illustrated Catalog FREE. Address Folding Sawing Machine Co., 308 S. Canal St., Chicago, Ill.

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]
Is the only Practical Preventive of the so-called Swine Plague.

If used in proper quantities, it will
1. *Prevent Disease;*
2. *Arrest Disease;*
3. *Pay for itself with the increased pork it will put upon the hogs.*

AS AN EVIDENCE OF FAITH
In my Remedy, I make the following offer:
I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my Remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and neither inbred, close-bred, or the progeny of such.

WHAT IS SAID OF THE REMEDY.
"It has stopped the hogs dying and improved their appetite."—F. C. GOLDSBOROUGH, Easton, Md.
"Have used the remedy with success."—D. G. BARBER, Easton, Md.
This medicine has been thoroughly tested and its merits established on the eastern shore."—Record and Gazette, Pocomoke, Md.
"I will not be without Haas's Hog Remedy if it costs three times the present price."—JOHN CASTIN, Grant City, Mo.
"We would not risk feeding a pen of hogs without the remedy."—WHITE & CO., Gibsonton, Pa.
"I would not think of raising hogs without it."—J. M. ELLSWORTH, Martinsville, Wis.
"It gives satisfaction every time."—J. G. BARTLETT & SON, Suncook, N. H.
"It has never failed to arrest the disease yet."—JONES & MUSSELMAN, St Paris, O.
"I have sold over $2,000 worth, and am pleased to say that it has given good satisfaction."—MELLE WILLIAMS, Druggist, Taylorville, Ill.
The Remedy can be procured of all druggists, or from my Laboratory, upon receipt of price.
Prices, $2.50, $1 25, and 50 cents per package. 25 pound cans, $12.50.

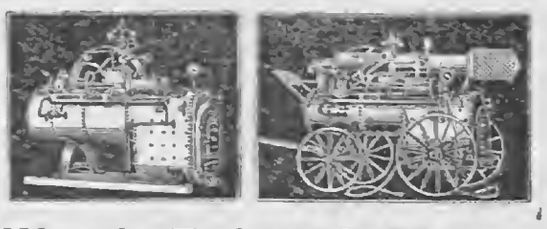
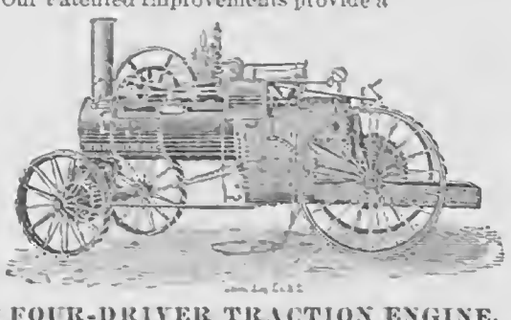
INDIANAPOLIS, INDIANA.



Wood, Taber & Morse,
Eaton, Madison Co., N. Y.,
Manufacturers of Portable, Agricultural, Stationary, and Traction
STEAM ENGINES
Of the highest standard, in every respect, of materials and workmanship. Were pioneers in the manufacture of Practically Portable STEAM ENGINES. And with determined policy to build only the best machinery from the best materials, and in the best manner of construction and with continued improvements, have attained the highest standard in excellence of workmanship, simplicity of design, and capacity of power. For a third of a century have maintained their manufacture.
The Standard Portable and Agricultural Engines of the World.
In addition to our STANDARD ENGINES, we now offer the first ROAD ENGINE which has the TRACTION POWER practically and efficiently applied to the four truck wheels, and while so applied to each wheel independently, the forward axle is under full control of the steering apparatus.
Our Patented Improvements provide a


FOUR-DRIVER TRACTION ENGINE,
which excels all other Traction Engines of equal cylinder dimensions in pulling capacity, and secures positive control and ease in steering on sandy, stony, slippery, uneven and otherwise difficult ground to travel. Descriptive Catalogues sent on application.

THE "STANDARD"
GALVANIZED WIRE NETTING.
NEAT CHEAP DURABLE
For Poultry Yard, Lawn, and Demesne Fence. Over 5,000 miles in use. Send for prices.
EVERYTHING FOR THE POULTRY YARD AND KENNEL.
Portable Poultry Houses and Dog Houses. Poultry Houses planned, built, furnished, and stocked.
How to Fatten Fowls by French Artificial Machine.
Illustrated Pamphlet, 10 cents. Illustrated Catalogue, 10 cents.
BROCKNER & EVANS, 28 VESEY ST., N. Y. City.

OUR "BABY" HATCHER.
CAPACITY 60 EGGS.
HATCHES CHICKENS
Price, $30.00.
Cheaper and better than with hens. Every FARMER should have one. The "NEW INVINCIBLE" HATCHER for Poultry Raisers is the BEST IN THE WORLD.
RESPONSIBLE AGENTS wanted in every county in the United States to sell our Hatchers and Poultry Supplies—A MONEY-MAKING BUSINESS. For Illustrated Circular and terms, address
BROCKNER & EVANS, 28 VESEY ST., N. Y. CITY.

AGENTS WANTED
Brown's Fence Builder.
A practical, simple, durable, portable, cheap and valuable FARM IMPLEMENT for building picket fence on the posts where it is to remain. Heavy wire and strong, heavy pickets used, easily operated by a 16-year old boy. Sixty rods made in a day at a cost of 30 cents a rod. Agents wanted.
JOHN P. BROWN,
RISING SUN, IND.

For the Young.

UNCLE MARK went on a little trip a few days ago. Down on Long Island at the edge of the Atlantic Ocean. We went hunting one day and went tramping over the salt meadows. There was no game to be seen and it was just as well, perhaps, for I am not sure that we could have killed any if it had appeared. Way down on the meadows we found a little shanty where a man and his wife lived. Their business is to guard the oyster beds. It must be a pretty lonely life. The shanty is built on a little island. There is no shade, no good water, and surely no society. The shanty is built on posts about four feet above the ground. This is necessary, for in Winter the high tides come sweeping all over everything, and sometimes even find their way into the house, high as it is. Great posts are driveu into the ground all around the house. These are to keep the ice back. There was a small tree growing in a keg placed on a platform. All around it pieces of bags had been nailed to posts to keep the wind away. A flock of long-legged hens were running about the house. I wondered what the tree and the hens do in Winter when the water and ice drive them away from the ground. There will be little room for them in the house, for the woman is almost as large as the house is. The man is so tall that he must have to sit down all the time that he is inside. It is hard to think that a man can't stand up in his own house. It must be a dreary, lonely place in Winter. They can see the lights on the main land, and yet know that their friends are out of reach. I think we are all lucky to find ourselves on dry land.

I hope we are all getting ready for Winter. The cold weather is surely coming and now is the time to make ready for it. Some houses need to be banked up, and there are boards at the barn to be nailed on. We want all these things done in season, then we can laugh at the cold. It will be no laughing matter if we have to turn out in cold weather to do the things we can do now.

SOME people have hard work to keep awake in church. They don't mean to show disrespect to the minister, but before they know it, they begin to nod away. When their chin comes down on their breast and they wake with a start, how ashamed they are. In olden times they used to have a man whose business it was to go around with a stick and poke sleepy boys and girls. Such a man would find plenty to do nowadays, I think. When I was a boy I knew that I should lose my dinner if I went to sleep in church. You may be sure I did my best to keep awake, for dinner was about the best part of Sunday. I have tried pins and pinching and kicking to keep myself awake, but sometimes sleep is just bound to beat you. I always have some sympathy for sleepy people now. The best way is to make sure of plenty of sleep at night. If you do that you won't find it so hard to keep awake during the day.

That dog that I told you about last week is a great coward. All cruel animals are cowards. Some time ago four dogs ran across the field. The largest was a big Newfoundland, while the others graded down to a little yellow cur dog. Our dog stood in the barn door and his master wanted to see a good race, so he told his dog to chase the others. The great fellow started off as hard as he could go, but which dog do you suppose he chased? Not the big dog that would have been a fair match for him, but he picked out that poor little cur and chased him as hard as he could. That is what I call a cowardly trick. It is like a big boy picking out some little fellow to try his strength upon. Whenever I see a boy do that, I want to see him well thrashed. The boy who won't take "somebody of his size," is no boy at all.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

"WHEN do Sunday come in the middle of the week?"

Johnny repeated the question, pulling earnestly at my coat. This was one of the most remarkable questions I had ever heard. I knew the teacher was expected to know everything, but this was a staggerer, surely.

"What makes you ask such a question, my boy," I said. I could hardly help patting the great bush of white hair.

"'Cause old Johnson, he sez I kin go an' see my mother when Sunday comes in the middle o' the week, an' I wanter see her mighty bad,"

"Where is your mother?"

"She's over yunder to the county house. She's sorter sick an' can't do nothin' ter speak on. I'd sorter like ter see her you know, cause she's the only mother I've got an' I'm the only boy she's got, an' we'd be sorter mates. When do you reckon Sunday's gouter skip a day or so, so'st I kin go?" It seemed almost cruel to tell the little fellow the truth. He was so eager as he looked up at me, that I did not like to tell him the time could never come.

"I don't know, Johnny, when it will come," I said at last.

The eager face clouded with disappointment. He pushed the mud restlessly with his foot and his hand fell from my coat.

"I'm mighty sorry, teacher. I reckoned you'd know all about it. Seein's you don't know, I reckon it won't never come. Say," he said suddenly, his manner changing, "how'd you lick a man ef yon wanted him fer ter feel it way down to his toes?" I could only look at him in surprise at this question. I had never felt that I should care to injure any person severely, so I had not decided which form of punishment would be most painful.

"Ye see," continued Johnny, "I'm gonter lick old Johnson when I git big enough, an' I want mightily fer ter do a good job. Like enough I won't have more'n one chance, so I wanter know what ter do. I heerd a feller read a piece onct about bilin' folks in fat. I reckon I'll bile old Johnson ef I kin git a kittle big enough. But yunder's Bill Johnson now, I reckon I'll git home."

He turned and ran to the gate and up the road. A horse's head appeared over the hill in the opposite direction from that which Johnny had taken. The head slowly grew to a pair of shoulders, and at last the whole horse came into view. He pulled a large wagon load of wood over the brow of the hill and then stopped to rest. A man sat on the wood. He eyed me critically as I walked down the road toward the director's house.

"Howdy, teacher?" he said, as I came near him. "Startin' in on school considerable brash aint ye? I've ben talkin' ter sum of the boys down yunder—like enough I kin give ye some pints."

Of course I told him I would thank him for any information he had to offer. He took off his hat, rubbed his head carefully for a moment, shut one eye and looked at me keenly.

I glanced around to see what had become of Johnny, but he was not in sight. He had climbed over a fence and run through the woods.

"I allus takes a big interest in schools," said Bill Johnson. "I ain't got no children o' my own fer ter send, an' I ain't no great scholar, but I've throwed three masters out o' that school house, so'st I sorter likes to see how things goes. I wuz a whale when I went ter school now I tell ye. Wis't I cud make it so'st I cud go this Winter. I expect me'n you cud lock horns in big style. But ez I wuz sayin' you 'pear ter be startin' in sorter brash, don't ye? Like 'nuff yer idees is all right where ye cum frum, but Bear Crick ain't figured up ter 'em yit. Ye done a poor job stoppin' 'em from playin' "The Needle's Eye." Thars whar ye rub agin the grain an' start fire. Then agin, ye sorter encouraged gamblin' when ye let them boys draw them cuts for that seat. Then agin them boys won't have no appetite fer lettin ye alone unless ye let 'em get a mouthful o' spellin' book. You make 'em write them words on the slate an' they'll write ye clean out the deestrict."

He would have given me more "pints" doubtless, but the horse showed signs of impatience and at last started on. So, with a cheerful "Good night teacher, better pickle up your muscle agin them boys," the load passed on, I went back to the director's house. He met me at the door.

"I congratulate you," he said "upon the remarkably auspicious opening you have made. I feel that we have put in the entering wedge of civilization and that the work we have this day begun will bear fruit in the after history of Bear Creek." I was in no condition to dispute this statement.

School went on fairly well through the week. I managed to maintain reasonably good order, though there was considerable muttering at times. Jack Brawn did not come. There seemed to be a general desire to wait until he put in an appearance before going into open rebellion. Johnny Billings was my favorite pupil. He was a very dull little fellow, and could not remember his words, but he worked so hard and followed me about so lovingly that I could not help liking him. It was partly my interest in him that led me to select Johnson's for my first place at boarding 'round. I sent word that I would come, and after closing school on Monday night, I started for Johnson's. Johnny had run ahead. I saw his white head in the barn as I turned into the yard. In answer to my knock at the door a harsh voice called out; "Walk!"

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I am a boy nine years old. It has been very rainy for two weeks. Farmers are bothered very much to get their wheat sown. Apples are a large crop here this Fall. We raised some very nice melons from the seeds sent us by the R. N-Y., but they did not grow large; the season has been so dry. The cantaloupes were very fine, but not very large. I have a young Shepherd dog which affords me lots of sport.

Hillsdale Co., Mich. JOHN E. CORY.

DEAR UNCLE MARK: It is long since I wrote to you and the Cousins. I have 11 Plymouth Rocks. My brother Johnny and I bought a calf from my father. It is a muley, and her name is Norma. My father has one light brown muley without one white spot and her name is Mollie. We raised some very nice Plymouth Rock chickens this year. I am very much interested in the Cousins' letters and the College Boy's Diary. If you would come out here I would show you one of the nicest apples you have ever seen. We have 19 apple trees that carried apples this year, and 14 that did not. I go to school now and am the biggest of all the pupils. We have some very nice cabbage. Our potatoes were very small, because it was so dry. Our teacher has written for the Harper's Young People for eight months, as 12 of the pupils each gave five cents; the others did not give any. Do you think we should let them read our own paper? Another time I will tell you the names of those who paid. LEWIS W. PETERSON.

Brown Co., Wis.

[I have a great mind to come out and see those apples. As you are the largest boy at school, I hope you set the others a good example. I like that idea of sending for the magazine. That is a splendid plan. I wish other schools would do it. About letting those other scholars read it! I don't think it will be fair for them to get something for nothing. Perhaps if they read a few numbers they will be glad enough to pay their share.—U. M.]

DEAR UNCLE MARK: As usual, I spent my vacation at Grandpa's. Last month Mamma and little sister went to Philadelphia to see Grandma, and so I stayed a month longer in the country. I ride three miles on the street cars to school every day, but next week I will have to go back to the city, as Mamma is coming home. I raised beans, lettuce, cabbage and potatoes in my garden. I planted my potatoes according to the RURAL plan—flat culture—and got nearly a barrel and a half. Grandpa said they were the finest potatoes he saw here this Summer.

For the second crop I planted enough potatoes for next year's planting, and some beans, egg plants and celery; all did very well. Last night we had the first frost, but it did not do very much damage. Uncle Mark, you did not send me any seed last Spring, but I forgot to give my address when I wrote to you, and may be that was the reason.

Your nephew, HARRY B. STILZ.

Louisville, Ky.

DEAR UNCLE MARK: I would like to join the Y. H. C. I am a girl, eleven years old, and live on a large farm in Dakota. We moved here from New York State last March. I have one brother and one sister. We have raised 36 chickens, and I have one pet, one that I call Peter. We have nine turkeys, three pigs and three horses and one colt, two cows and two calves, and I have a striped cat I call Tiger. It has caught 10 gophers, and I don't know how many mice. We have wild geese, ducks and prairie chickens around us. Pa has taken the RURAL 25 years, and cannot do without it. The Garden Treasures all came up nicely, and we had a handsome flower garden. I planted the cantaloupe seed, and the largest one measured 20 inches one way and 26 the other. I did not think I could raise the largest one, so I did not send it. Your niece,

HELEN M. HAWLEY.

McCook Co., Dakota.

[That cat earns his living surely.—U. M.]

DEAR UNCLE MARK: I have written you a letter before, but it was not printed. We raised about 100 chickens this Summer, but there are some hawks around here and they have caught some of them. Papa shot one of the hawks. I have a rabbit which is so tame that when I call him he will come and eat out of my hand. He is black and white and his name is Dick. I had a steel trap set for a rat and caught a red squirrel in it. I had another trap set in a field and caught a woodchuck. We have a horse that is over 30 years old. I would like to correspond with Manson T. Dye, of Florida. I wrote him a letter but have not received an answer yet. I hope, if he sees my letter in print, he will write me a letter if he wants to correspond.

CLAYTON Q. WRIGHT,

North Ridge, N. Y.

Hood's Sarsaparilla

This successful medicine is a carefully-prepared extract of the best remedies of the vegetable kingdom known to medical science as Alteratives, Blood Purifiers, Diuretics, and Tonics, such as Sarsaparilla, Yellow Dock, Stillingia, Dandelion, Juniper Berries, Mandrake, Wild Cherry Bark and other selected roots, barks and herbs. A medicine, like anything else, can be fairly judged only by its results. We point with satisfaction to the glorious record Hood's Sarsaparilla has entered for itself upon the hearts of thousands of people who have personally or indirectly been relieved of terrible suffering which all other remedies failed to reach. Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Apothecaries, Lowell, Mass.

100 Doses One Dollar

Address RENNIE & ALLISON MFG. CO., 725 Filbert Street, Philadelphia, Penna.

PERSONALS.

JAMES C. FLOOD has just finished a $2,000,000 dwelling in San Francisco.

EX-PRESIDENT ARTHUR is still a sick man. Looks a heavy shadow of his former self.

JEROME INCREASE CASE is the full name of Jay-Eye-See's owner, and he has a fortune of $5,000,000.

SECRETARY MANNING is in very good health, thank you, and has resumed his duties as head of the Treasury Department.

KATE FIELD says that prohibition in Iowa makes sneaks and hypocrites of otherwise well-meaning people, and that it turns the drug stores into grog-shops. How does Kate know?

THE New York heirs of the late Vice-President Hendricks' mother will contest the will which left the entire estate to his wife. They claim a one-third interest.

OVER 50 Southern women are connected with the new papers of the South, and on the 3rd of next month they propose organizing a Southern Woman's Press Association.

THE compromising stories about Mgr. Capel, circulating in the Eastern papers, have found their way back to California, and the priest telegraphs the New York Herald an indignant denial of the charges.

THE only Republican elected to the Georgia Senate is Ben Duggor, a veterinary surgeon from the mountain district. An Atlanta dispatch calls him "uncouth," but "immensely popular" in his district.

WALKER BLAINE is going to Chicago to live. His younger brother, Emmons, who married Joseph Medill's daughter, has worked his way up to be principal attorney for the Chicago and Northwestern Railroad.

A SON of John Brown, who owns a large vineyard at Put-in-Bay, is such a radical temperance man that he will not sell a pound of grapes to be made into wine, and he always votes the straight Republican ticket.

SOME of her admirers in the Argentine Republic have presented to Sarah Bernhardt, the actress, who is now performing in South America, 2,000 acres of land. She may yet settle down to the life of a stock farmer.

PRINCE LOUIS NAPOLEON, son of "Plon-Plon" and Clothilde, sister of the King of Italy, and heir to the Bonaparte Imperial pretentions, who arrived at San Francisco from Japan by the last steamer, left Wednesday for New York.

THE President has appointed Col. James C. Duane to be Chief of Engineers of the United States Army with the rank of Brigadier-General, *vice* General Newton resigned. Gen. Duane is now on duty in New York as engineer of the 3d light-house district.

THE Sultan of Turkey is a connection of the late Emperor of the French. He is directly descended from Mlle. Dubuc de Rivry, who was captured by Algerine pirates and became the favorite wife of the then Sultan, Selim; and she was a Creole, first cousin to Mlle. Tascher de la Pagerie—the Empress Josephine, grandmother of Napoleon III.

THE Hon. Cassius M. Clay will be 79 years old on the 19th of this month. He is hale and hearty, and looks as if he might easily live to see the century close. A few days ago he was unanimously nominated for Congress by the Republicans in the Eighth Kentucky District, but he thought the time for the canvass too short to make it thorough, and declined.

WHAT think you of a man who prizes children chiefly because they will be future soldiers? At a railway station in Saxony, Bismarck, stopping to change trains, addressed a porter by whose side stood a little boy: "Is that your son?" "Yes, Your Excellency." "Have you any more?" "Four, Your Excellency." "That is well. They will make good soldiers. God bless them!"

MR. BLAINE has a good story about General Grant, who once visited Maine and rode through the State with Ex-Governor Washburne and her favorite son. Washburne was boasting of Maine's glories, when General Grant, nudging Blaine, said: "I believe Maine is a great corn State; some of the corn patches we've passed remind me of the corn-fields in Illinois, in which a man on horseback cannot reach the tassels." Washburne did not see for a moment that in one case the horseman could not reach up to the tassels and in the other case could not reach down to them.

BUHACH
THE GREAT CALIFORNIA

INSECT POWDER.

A pure California production, an infallible exterminator of Roaches, Bed-bugs, Waterbugs, Flies, Fleas, Mosquitoes, Ants, Moths, and in fact all insect pests of the household, field, orchard, garden, and conservatory.

BUHACH is guaranteed to be as harmless to animal and plant life as it is destructive to that of the insects.

BUHACH is the powdered blossoms of a California grown flower and absolutely contains no acids or poisonous drugs of any description.

BUHACH is not to be classed with the thousands of worthless and dangerous preparations so called "Insect Exterminators."

BUHACH is the insecticide of progress.

Pure! Powerful! Potent!

BUHACH is not sold in bulk, but in sealed tins with yellow labels, upon which appears our Trade Mark BUHACH as above. Beware of base imitations. Ask your druggist or grocer for it and see that you get it. Descriptive circulars mailed free upon application to us. BUHACH PRODUCING & M'F'G CO. of STOCKTON, CALIFORNIA, 49 Cedar St., New York.

THAT DEAR LITTLE DOG!

Humorous.

HEAR the tinkle of the bells—
Chestnut bells.
What a world of ancient gags their melody foretells.
How they ting, ting, ting,
Through the super-heated air,
While you'd give most anything
If you only could fling
Something at the "John-mule" there—
As he chimes, chimes, chimes,
On that bell a dozen times;
And a hundred rousing cuss-words from your heaving bosom swells,
At the bells, bells bells, bells,
Bells, bells, bells—
At the jinglug of the blasted "chestnut" bells.

A NEW STORY,

"Relations-in-Law"

BY

MARION HARLAND,

In The Philadelphia

Ladies' Home Journal

AND

Practical Housekeeper.

"Madam stood on a venerable and precious rug; the twins supported her on the right, Wilhelmina on the left.

"'As My Son's wife you are welcome to his mother's house,' said the chest voice, rumbling more deeply than usual by reason of the bronchial affection. 'My daughters! kiss your sister.'

"Nellie, like the educated children of most 'new people,' had a profound veneration for old blood and thorough breeding. Her ideals of the perfect ease and fine courtesy that obtains in 'our best circles' broke and fell under the experiences of the next few hours."

A story of particular interest to young married people, or those contemplating matrimony, commences in November.

"The Charity of the Jonesvillians," by Josiah Allen's Wife, full of humor and pathos—a rich story.

"An Old-Fashioned Mother," by Elizabeth Stuart Phelps, a splendid story for girls.

"Mother's Corner," "Artistic Needle Work," "Home Cooking," "Etiquette," and "Flower" Departments are all special features. THE LADIES' HOME JOURNAL is elegantly illustrated, employs the best writers, and has nearly 400,000 paid subscribers.

☞ Mailed to any address, 3 months on trial, on receipt of only **10 cents**, in silver or stamps.

Farm and Fireside says:

"It is the only Meat Chopper we ever saw that we would give house room. It has proven such a very useful machine that we want our readers to enjoy its benefits with us."

American Agriculturist says:

"We have given this Meat Chopper a thorough trial with most satisfactory results. They excel anything of the kind made in either hemisphere."

"I have tried it for cooked and uncooked meats, and find it far surpasses any chopper I have ever used. My pupils, that have used it, are delighted with it."

Mrs. S. T. RORER, Principal Phila. Cooking School.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1918. NEW YORK, OCTOBER 30, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

Horseman.

TROTTING STALLION KING WILKES.

W. T. CHESTER.
(Of the Turf, Field and Farm.)

THE farmers of the country are rapidly waking up to the fact that it is the truest economy for them to breed their work mares to horses whose produce will have an initial and intrinsic value, because of the reputation of the sire. The horse-breeding interest in this country, both in thoroughbred and trotting lines, has made tremendous strides of late years, and, while it is true that the agricultural element has not kept up with its marvelous pace, it is also true, as I remarked, that farmers are beginning to note the advantage of breeding their, so-called, common mares to superior stallions. The instances, on the trotting turf especially, where great performers have been thrown by mares of unknown breeding to the embrace of favorite sires, have been very numerous, as is attested by the summaries in such a work as Chester's Complete Trotting and Pacing Record, where the sire is named, but the dam is given as unknown, in the case of many an animal that has trotted or paced in 2:30 or better. There are on the farms of this country positively thousands of excellent mares, which have the grand qualities of endurance, disposition and capabilities of motherhood, but lack fashionable breeding, yet which are as likely as any others to drop a fast and valuable trotter, if bred to the right sire. It should be borne in mind by owners of such mares that it costs no more to raise a foal when the service-fee of the stallion is $100 than when it is $10, but the chances of realizing $1,000 from the more expensive service are ten times greater than are the chances of realizing $100 from the cheaper service. There are true economies and false economies; but it can safely be said that it is always a false economy to breed a mare that is worth raising a colt from at all to an inferior stallion because his fee is low, when the services of a decidedly superior horse can be had at the expense of a few additional dollars. One fast and good colt is worth in the market anywhere from five to 50 or 100 times as much as a poor colt, and the chances of getting a first-class colt from a farm mare which is game in her work, level in her head, and of good disposition and conformation, are very little, if any, less than from a mare of the most fashionable lineage, that has nothing else to back her. We are far from advising that really worthless mares should be bred to expensive stallions, as that would be throwing money away in ninety-nine cases out of a hundred; but on every farm with several head of stock there are one or more tried and true mares, with no special pedigree behind them, in whose behalf it would be well worth while to spend a trifle of extra money for the sake of their progeny.

And this is especially to be advised in the case of those mares, of which nearly every prosperous farmer has one or more, which are the owners' favorites for driving, because they specially evince the trotting disposition. The produce from such mares, when bred to a first-class trotting sire, may be very valuable animals, and will surely be worth more than if the sire had been a "dung-hill."

KING WILKES (1867). 2:22¼. Fig. 401.

There are few localities in this country where the farmer cannot conveniently obtain the service of a good stallion, whose blood is such as to justify the expectation of good foals when coupled with such mares as I have indicated. At Fig. 401 is an excellent likeness, from a photograph, of the stallion King Wilkes, owned by R. B. Conklin, 146 Center Street, New York City. He is a son of the greatest sire of trotters, all things considered, that has ever lived, George Wilkes, and his dam was Missie, by Brignoli. George Wilkes had a record of 2:22, which was, for a long time, the fastest ever made by a stallion, and among his get are Harry Wilkes, the best performer of 1886, and 43 others with records of 2:30 or better. He was a son of Rysdyk's Hambletonian, indisputably the greatest of trotting progenitors, and had a rich infusion of Clay blood on the side of his dam. Brignoli, sire of the dam of King Wilkes, was a trotter himself, with a record better than 2:30, and was a son of Mambrino Chief, sire of the celebrated Lady Thorne, and the founder of the greatest of trotting families after the Hambletonian. On the side of his grandam, King Wilkes is rich in Thoroughbred lines, and from the strains that have been productive of trotters. He was foaled in 1876, and when very young showed so much speed that he was given little service in the stud, but trained for the turf, on which he had a series of brilliant victories.

In 1882 King Wilkes beat a field of four at Pittsburgh, Pa., for a $1,500 purse, and acquired a record of 2:26¼, and in 1883, at Utica, also for a purse of $1,500, he beat Frank, 2:19½; Index, 2:21; Stephen G., 2:20½, and several others, and lowered his record to 2:23. August 27, 1884, at Hartford, he trotted a grand and memorable race. It was a first-class party, and Fabian tactics were pursued with King Wilkes. Walnut, 2:19¼, took the first heat in 2:21¼; Judge Davis, 2:20¼, the second in 2:23¼, and Butterfly, 2:19¾, the third, in 2:25. At this juncture the game and lasting qualities of King Wilkes asserted themselves. The others fought bravely, but the son of George Wilkes and Missie beat them squarely down the homestretch in 2:22¼, his present record, in the fourth heat, followed it up by taking the fifth heat in 2:23¼, and defeated a tired party in the sixth heat in 2:24¾. The sort that give it up never trot such races as this one was.

King Wilkes made his first regular season in the stud in 1885, and, consequently, has very few sons or daughters old enough for public performances. Indeed, he sired but ten colts foaled prior to 1886 that are now living. One of them, Oliver K., foaled in 1880, was the sensational trotter of 1886. He got a four-year-old record of 2:24½, but this season astonished the entire country, winning the $10,000 purse at Charter Oak Park, Hartford, Conn., and in his last race defeating the invincible, as was supposed, Harry Wilkes, at St. Louis. His record was reduced this season to 2:16¼, but he is looked upon as the most likely of trotters to eclipse the record of Maud S. His owner sold him for $17,500, after the Hartford race, and had won much more than that with him during the trotting of the year.

HORSE SENSE.—For those who like to drive elephants, the Percherons and their grades are fine. I want horses with more sense and more life. It is easier to tone a nervy horse down to good, steady work than it is to put intelligence and energy into a great lump of muscle..... Many colts are given ugly tempers by careless currying. Some people curry a horse as though they wanted to hurt him all they can. To scratch and grind a young colt will work just as it does to wash a boy's face by poking soap into his mouth and eyes. They will both come to hate the operation and the operator.....I don't think much of the practice of bedding horses a foot or more deep with straw. Most horses lie down but a little. I have owned several horses that seemed never to lie down. Therefore, I consider it poor policy to put a great quantity of litter under them. "HORSEMAN."

The Herdsman.

A PRACTICAL MISSIONARY.

A GOOD bull is a missionary. His influence extends further and does more to elevate man-

kind than many who are familiar with him will at a first glance be able to see. He may carry no clothing to naked heathen in sultry tropics, but he does provide comfort for many needy nearer home, who may be better worth saving. He may teach no schools for benighted savages, but he does help people cultivate their mental powers for the good of mankind. He may not convert cannibals, but his influence does lessen want, and sin, and crime among the races now spreading over the world (as we believe) to rule it to its great benefit.

How this practical missionary does all these great and good things is so easily seen that there seems to be scarcely a warrant for telling the story—and yet it is only a few weeks since a paper published in the interest of live-stock breeders asserted that no bull is worth more than—I forget the exact figures, but say $1,500. It is plain that if he who causes two blades of grass to grow where but one grew before is a benefactor of his race, he who produces 100 pounds of beef where but 75 pounds were produced before is also the benefactor of his kind. If he can improve the quality while increasing the quantity he is so much the more a benefactor. To the extent that he has added to the available supply of food for man, he has added in effect to man's income. Increase of income means added comfort for the family, better housing, clothing, and nourishment for children, and from these better conditions come better health and longer life. Vigorous bodies support energetic minds in the effort to get the means wherewith to do the work the world requires of each. With increased intelligence comes aptness for yet higher culture, and greater and more intense dislike of offences against social, legal, or moral laws. With higher and more universal education there will be fewer crimes to punish, less cumbersome and costly machinery of police, of courts, of lawyers, and of prisons to maintain, and there will be fewer paupers for the industrious and honest to support.

Defining the extent of the influence of the missionaries under consideration is not easy. Men who have practical knowledge of cattle growing say that a well-bred bull of the established beef breeds will, even when coupled with an animal having no improved blood, produce offspring that will grow one-half faster and make one-quarter more and better beef from a specified quantity of food, than will an animal in which there is no good blood. Thus while a bullock of good breeding will in two years grow to a gross weight of 1,500 pounds and yield about 900 pounds of tender, juicy well marbled flesh, nutritious and palatable, the scrub will require much more food and from three to four years' time for making a like weight of beef of inferior quality. A bull of good milking or butter making race will increase the milk or the butter yielding capacity of stock so greatly that the daughter of a scrub cow coupled with such a bull may give quite double the quantity that her dam could produce. It is by no means difficult to see how important a matter this may be to the individual farmer, but I purpose to show in another paper something of the extent to which the country at large might be affected by a general use of pure blood. E. W. PERRY.

Chicago, Ill.

DEHORNING CATTLE.

I FAIL to see why the papers are so slow about taking up the practice of dehorning cattle. I consider the question a vital one to all cattle growers. Where do you find one of more importance? If dehorning is right then the people ought to know about it. I have studied the matter for years and convinced myself and hundreds of others that dehorning is safe, profitable and not essentially cruel. I have stood the test of a trial for cruelty to animals, and all the State Humane Society could not make up a case against me. Dairymen should know that dehorning saves 25 per cent. of hay in Winter, 50 per cent. of shed room, 50 per cent. of manure, all loss of human life, all loss of calves by abertion, and all loss of sheep, pigs, cattle and horses by horns. Most of those who talk about dehorning cannot tell anything about the anatomy of the horn. There is nothing about it in the books and the only way it can be learned is by studying the animal's head. I know that there is a point where the horn can be cut so that a stub will grow. There is another point where no stub will grow, and where the pain and bleeding will be so slight that the animal will suffer but little. Cut the horn above this point and the animal will bleed till it falls. These things I know because I have tried them. I am satisfied that my system of dehorning has never been practiced before. It is bound to come into general practice. H. H. HAAFF.

Henry Co., Ill.

SWISS CATTLE.

CONSUL WINCHESTER writes that while in pastoral countries generally cattle for milking, work and fattening are kept and treated separately, the Swiss cow is expected to unite all these qualities. It is thought that a cow is benefited by being worked in the forenoon. The cows are driven in harness. A cow that does not give 16 quarts of milk at time of calving is not considered worth keeping. Cheese in some parts of the country forms the staple article of food. Laborers are often paid in it. New cheese will sometimes cause illness; in that case the patient is treated with old cheese on the homœopathic theory. In 1885 Switzerland sent to the United States 3,500,000 pounds of cheese. At the district cattle shows, an examination of all breeding bulls is held. Prize bulls cannot be taken out of the Canton for at least one year after the show. No unregistered bulls can be used for breeding purposes. A prize cow cannot leave the Canton before calving. When any serious cattle disease arises all animals that may have been liable to contagion are placed under supervision; such as may be deemed necessary are killed and everything is done to completely stamp out the disease. The cattle destroyed are paid for by the general government. How would a few of such rules work here? Suppose we had, for example, a County Commissioner to go around and knock all scrub bulls on the head. Our stock would be 50 per cent. better, but what a howl there would be about this land of freedom!

SPAYING HEIFERS.—Among the stock owners all over the country there is a growing opposition to the use of scrub bulls, and on the ranges there is considerable talk in favor of spaying all common and low-grade heifers. So long as such heifers are allowed they will produce their kind—a poor and unprofitable sort, entailing a serious loss of feed each year. By spaying a stop would be put to the propagating of inferior stock, and the spayed animals would be turned to the most profitable use. The risk in spaying would be next to nothing in the hands of a skillful operator; the cost would be from 50 cents to $1. Spayed heifers are usually somewhat smaller but handsomer than steers, fatten more readily and make just as good beef.

DRESSED MEAT FROM THE FAR WEST.—That new National Consumers' Meat Company under the control of the Marquis de Mores, which began last July to supply New York with dressed beef from Montana, is doing a thriving business here, in spite of a rigid boycott by local butchers. It has two new buildings under construction, and expects by November to receive the carcasses of 200 beeves daily. Now the daily receipts are 10 cars of beef and 10 of pork. When all five places are open the coming Winter it expects to dispose of 300 beeves and 900 hogs every day. In Summer Medora supplies grass-fed cattle, and in Winter Kansas is to supply corn-fed beef, pork and mutton. The meat is on the road seven days, and gets here, it is claimed, in prime condition.

THE following dates are given for meetings of Cattle associations:—Red Polled Cattle Club, at Grand Pacific Hotel Chicago, Ills., Nov. 17. Devon Cattle Club, at same place Nov. 11. Oxford Down Record Association at Sherman House Chicago, Nov. 16. Missouri State Short-horn Breeders' Association at Kansas City, Nov. 26. The National Cattle-Growers' Association of America, will meet at the Sherman House Chicago, Monday Nov. 12. It is expected that the convention will ratify the agreement made last Fall for the consolidation of the Chicago and St. Louis Associations, under the name of the Consolidated Cattle Growers' Association of America. A call has also been issued for a grand assemblage of cattle men from all parts of the country at the same place, to commence Nov. 16.

RELIEF FOR CHOKING COW.—A choking cow can often be relieved by pouring cold water into its ear. Take cold water in a pitcher or teapot, turn the animal's head to one side and pour a good stream directly into the ear. This will cause the cow to jump and shake its head fiercely and the jerking motion will often dislodge the obstruction. The idea is to make the animal make an effort to free itself. The general practice of pushing the obstruction down the throat or crushing it gives the animal no chance to help itself. A good syringe would be the best thing to force the water into the ear with, but few families have one ready for use, so the common teapot will answer. FARMER'S WIFE.

THERE will be a butcher's contest at the Chicago Fat Stock Show. Prizes of $100, $75 and $50 are offered for the most skillful butchering. In the "scale of points" adopted in this contest 20 are allowed for time and 80 for skill in performing the work. The limit is 25 minutes. Where the work is done in this time, 20 points are scored. For every minute over this time two points are dropped, and for every minute under two points are added.

MILKING SHEEP.—There is a strong feeling in New Zealand in favor of milking sheep for the purpose of cheese making. Very large numbers of ewes are kept in one district of France where the celebrated Roquefort cheese is made from their milk. The making of cheese from ewes' milk was formerly quite a large industry in Scotland. The New Zealanders think that by adopting the practice dropped by the Scotch, but kept up by the French, they will add a very profitable item to their exports.

LOSS OF SHEEP IN BUENOS AYRES.—The loss of sheep in Buenos Ayres the past Summer must have considerable influence on the rise in the price of wool. According to the latest advices, the number lost was over 20,000,000, valued at $22,500,000, or 12 per cent. of the entire value of the flocks and herds in the whole Province. The disaster was caused by a disease known as "lung and throat worm," an affliction never before experienced in the Argentine Republic.

THE managers of the St. Louis Fair are criticized for appointing two breeders of beef cattle as judges of dairy cows. Much dissatisfaction resulted. It is hard to see how a man who has spent years in developing beef animals can be a good judge of dairy points. The custom at some shows appears to be that of selecting judges at random from the visitors. It can be readily seen that such a course gives a chance for much dissatisfaction.

SMITHS POWELL & LAMB send us a fine lithograph of a group of the Clothilde family of Holstein-Friesians. This picture, by Cecil Palmer, is the finest cattle group we have seen. It is even superior to the famous group of the Aaggie family published two years ago.

DEVON cattle are appearing in larger numbers than ever at the Western fairs. The Devons are fine cattle. They are shapely, serviceable and beautiful—but they have the most cruel horns of any breed

THE latest objection urged against polled cattle is that it will be impossible to tell their age except by examining their teeth.

Dairy Husbandry.

DAIRY NOTES FROM ENGLAND.

PROFESSOR J. P. SHELDON.

English opinion of American oleo legislation; English views on taxation of food imports; protection demanded against fraud not competition; bogus butter must be sold as such; justice all round; great depreciation of dairy products; slight improvement lately; fair crops on the whole.

WE are a good deal interested in England with the action which has been taken by your Congress in respect to artificial butter, its manufacture and sale; and we regard the language used by President Cleveland, on sanctioning the bill, with very considerable satisfaction. Probably we farmers should not wish to impose a tax on butterine made in this country, or coming into it; and even if we should our wish would not be easily granted. Such a wish, indeed, would be opposed to the spirit and traditions of a free-trading country. We admit, in fact, under certain conditions, the usefulness, though not the legitimacy, of artificial butter. In a country whose population greatly exceeds its capacity to produce sufficient food, it is well to think twice, and many times twice, before the sustenance of the people is curtailed by an imposition of taxation. Such an act would be regarded by the masses of the people (an enormous majority of whom are not at all connected with agriculture, save as consumers of agricultural products) as protection in the interests of a class, and would consequently be resented and opposed to the uttermost.

British farmers, indeed, do not ask for protection, but they ask for fair play. This, of course is protection in a sense, but not in the ordinary acceptation of the word. We ask for protection, not against competition, but against fraud. We do not ask for protection that will artificially increase the value and price of our products, but we do ask for protection against that which artificially decreases the value of such products. And as we object to having our products unfairly depreciated in price, so we do not claim that our great competitor, arrant impostor though it be, shall be handicapped by a tax. What we ask for is this, viz., that butterine shall be sold under a name which will not deceive anybody. We do not specially object to the word "butterine," though it is imitative and adventitious; but we do object, with all the might that is in us, to butterine being sold as butter. Our contention is simply this, viz., that all artificial butter shall be sold as such, in order that people may know what it is they are buying. If the public prefer butterine to butter as a throat lubricator, well and good, only let them be under no delusion on the subject. Butterine, we know, can be made and sold for a much smaller price than butter, and still yield a handsome profit: therefore we say—let it be sold on its merits, and at what the public choose to give for it with their eyes open. We demand, shortly, that every pound or parcel of butterine shall be distinctly marked by a name which designates its real character and indicates its artificial origin, and we would not hesitate to fine a man heavily, or imprison him for violating the spirit and the letter of this demand. We want to protect the public against a secret fraud, an insidious imposter, and butter against a swindling competitor. This done, the public may buy butterine if they prefer it, at a price which is not increased by legislative action, and butter must take its chance in the field. So far, however, we have not been able to accomplish this, though we have tried a time or two. The Irish Home Rule problem obscures everything else at present; but we intend to "peg away" until we have had justice done to the dairy farmers, and to the public too.

Meanwhile I am glad to be able to notify a general improvement, though not a great one, in the condition of dairy farming. During the past 12 or 18 months, butter has been lower in price than any one remembers to have been the case before, in this line, in this country. Cheese, too, has ruled very low, though I remember it lower; and cattle have gone down quite one-third, as compared with three years ago. Now, however, there is an all-round improvement, though not a great one, and farmers are cultivating hope once more. It is not to be expected that we shall recover lost ground, but if the improvement noted continues, we shall be able to hold on to what we have, and in time may get once more into smooth water. So far we have had an uncommonly fine Autumn; stock of all sorts have thriven well, and the grain harvest has been a decided success on the whole. The hay crop as a rule was not well harvested, owing to the wetness of the Summer months; but there is a plentiful supply of Winter forage, and of grass on the pastures. As I write, however, we are in almost hourly expectation of one of the storms you are in the habit of sending us, and of which you are good enough to notify us beforehand. This may break up the fine spell of weather we are having, and hasten the advent of Winter; but we hope it will pass over and have done, leaving no evil legacy behind.

The Swineherd.

PORK PACKING.

COL. F. D. CURTIS.

THERE are special and rigid rules in force in connection with the slaughtering, curing and packing of all pork products. Every animal is inspected before slaughter, to detect any unsoundness or disease, as such unsoundness or disease would make it unfit for packing. The packer's own interest would not allow of his using any animal of doubtful soundness, as one piece of the same would spoil a whole cask or box in which it might be packed.

For the same reasons the hog must be perfectly cooled before slaughter, and so must the meat before packing. Each piece of meat is inspected before packing and each shoulder and ham. Hogs are watered at the slaughter-yards, as it helps to keep them cool, and they are also fed. By being fed they are more quiet and not so liable to get heated. There are enough selfish reasons to insure care and comfort for hogs in the yards and at the slaughter houses, aside from all sanitary reasons. If hogs are not fed they consume themselves, or, in other words, draw for support on the internal stores of flesh and fat which support life. It is cheaper to give them food and so keep them from becoming wasted on the one hand and peevish on the other. The slaughtering is done rapidly and so is the dressing, with all the appliances to make haste and to do the work well. There are rules for cutting to conform to the demands of the trade, and some localities, like Cincinnati, have special forms.

The following are the different forms in which pork is cut and barreled. The most common form is called "mess pork." All of the others are made from a closer selection of the meat and more particular trimming and packing.

STANDARD MESS PORK should be made from the sides of well-fatted hogs, split through or on one side of the back-bone, an equal proportion being on each side, cut into strips of reasonably uniform width, properly flanked and not backstrapped. One hundred and ninety pounds of green meat, and, between March 1st and November 1st, 200 pounds, num-

bering not over 16 pieces, including the regular proportion of flank and shoulder cuts placed four layers on edge without excessive crowding or bruising, shall be packed in each barrel, with not less than 30 pounds of coarse salt, the barrel to be filled with brine of full strength; or 30 pounds of coarse salt, and in addition thereto fifteen pounds of salt, the barrel to be filled with cold water.

PRIME MESS PORK should be made from the shoulders and sides of hogs weighing from 100 to 175 pounds net, to be cut as nearly as practicable into square pieces of four pounds each, the shank of the shoulder to be cut off close to the breast. One hundred and ninety pounds of green meat in the proportion of 20 pieces of shoulder cuts to 30 pieces of side cuts shall be properly packed in each barrel, with not less than 20 pounds of coarse salt, the barrel to be filled with brine of full strength; or 20 pounds of coarse salt, and in addition thereto, 15 pounds of salt, the barrel to be filled with cold water. There shall also be put into each barrel 12 pounds of saltpeter.

EXTRA PRIME PORK should be made from heavy, untrimmed shoulders, cut into three pieces; the leg to be cut off close to the breast, and in all other respects to be cut, selected, and packed as mess pork.

LIGHT MESS PORK should be made from sides of reasonably well-fatted hogs; and in all other respects be cut, selected and packed the same as mess pork, except that as many as 22 pieces may be put into each barrel.

BACK PORK should be made from backs of of hogs after the bellies have been taken off, cut into pieces of about six pounds each, and in all other respects to be cut, selected, and packed in the same manner as mess pork.

EXTRA SHOULDER PORK should be made from heavy trimmed shoulders, cut into three pieces; the leg to be cut off close to the breast, and in all other respects to be cut, selected, and packed in the same manner as mess pork.

EXTRA CLEAR PORK should be made from the sides of extra heavy, well-fatted hogs, the backbone and ribs to be taken out, the number of pieces in each barrel not to exceed 14, and in all other respects to be cut, selected, and packed in the same manner as mess pork.

CLEAR PORK should be made from the sides of extra heavy, well fatted hogs, the back-bone and half the rib next the backbone to be taken out, the number of pieces in each barrel not to exceed fourteen, and in all other respects to be cut, selected, and packed in the same manner as mess pork.

CLEAR BACK PORK should be made from the backs of heavy, well-fatted hogs, after the bellies have been taken off and the back-bone and ribs taken out, cut into pieces of about six pounds each, and in all other respects to be packed in the same manner as mess pork.

RUMPS should be trimmed with only enough taken off to make them neat and smooth; the tails to be cut off close, and in all other respects to be cut, selected, and packed in the same manner as mess pork.

EXTENT OF THE TRADE.

These are cuts for the home trade, and styles for curing and packing, and also for the British market. Some of these cuts are in imitation of those which are the most popular on the other side. Some of the most extensive pork-packing establishments in this country are owned and conducted by foreigners or were established by them, and they have branch houses in Great Britain. The packing trade is moving westward, and recently it has been started at Omaha on a large scale. It is also increasing in Kansas City and becoming less at Cincinnati and Minneapolis. Few people realize the extent of the pork business in this country. The hog pays the balance in our foreign exchanges, and furnishes more meat food for the people than anything else. [We object to its supplying the butter.] The aggregate number of hogs of all ages now slaughtered annually in the United States is estimated at about 30,000,000, averaging in dressed weight 175 pounds each, or 5,250,000,000 pounds of gross product, making a total of cured meats, lard, and other products of 4,725,000,000 pounds.

The Poultry Yard.

NEST BOX AND PERCH.

THIS is one of the neatest and handiest contrivances for the purpose that I have ever seen. Fig. 405 is a view of the front and one end. Fig. 406 is a bird's-eye view of the interior. The box is six feet long, 21 inches wide and 12 inches high. The entrance to the nests is at one end, and along a passage back of them. The nests are 10x12 inches square, the passage nine inches wide. A strip, S, four inches wide, running lengthwise of the box, back of the nests, serves to confine the material comprising the nests and to prevent the eggs from rolling into the passage. At the end of the passage, opposite the entrance, a hole three inches square is cut to admit air and light. The eggs are gathered by opening the shutter in front. The perch, P, stands three inches above the top of the box. It may be extended 20 or 30 inches beyond either end of the box if more roosting room is desired. There is no bottom to the box; it rests on the floor of the poultry house, and when it is desired to disinfect, paint, whitewash or apply insecticides, it can be picked up and carried out, the nest material swept up and burned, the floor scalded, dashed with lime, kerosene or other insecticides and the entire affair made clean and sweet in a jiffy.

The nests being hidden from the other fowls and most of the light excluded, the danger of eggs being broken or eaten is reduced to a minimum. F. GRUNDY.

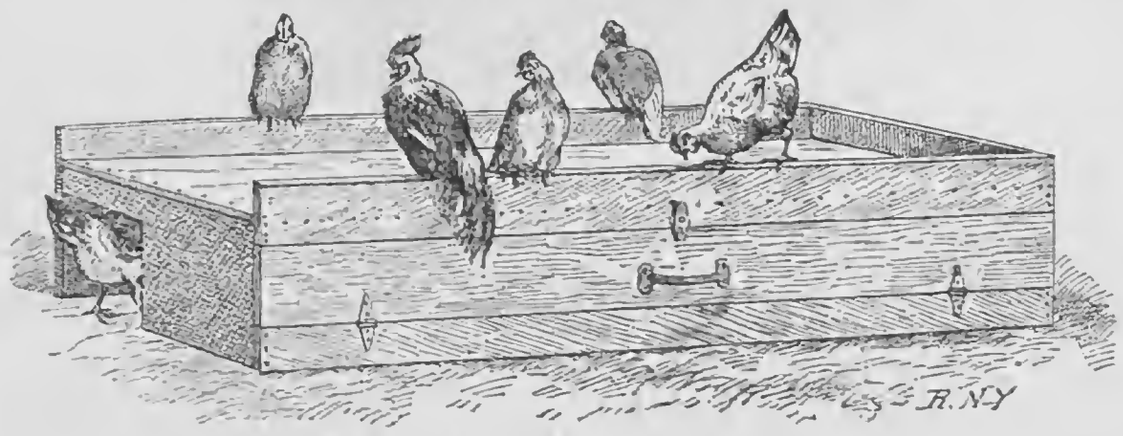
Christian Co., Ill.

POULTRY NOTES.

ON a narrow strip of ground just around our poultry yards, we are going to sow rye. It will be handy for green feed just when the hens need it. We are only waiting for a good rain now. The ground is as dry as a chip at present.

WE have planted two plum trees in each of our three yards. They are protected by means of flat stakes driven closely together around the trees, so far away that the hens cannot reach them.

NEXT Spring, when the hens first begin to stop laying, and when eggs go down in price, we expect to turn the hens all into two yards. This will give the third yard for oats, millet, or other forage crop. The cow will enjoy this, and it will go far towards keeping her. It will leave a good stubble for the hens to work over, and clean the soil in good shape. This will be cheaper than throwing out the surface soil and putting new soil in. It will give two years of manuring by the hens and one year of cropping.



NEST BOX AND PERCH. Fig. 405.

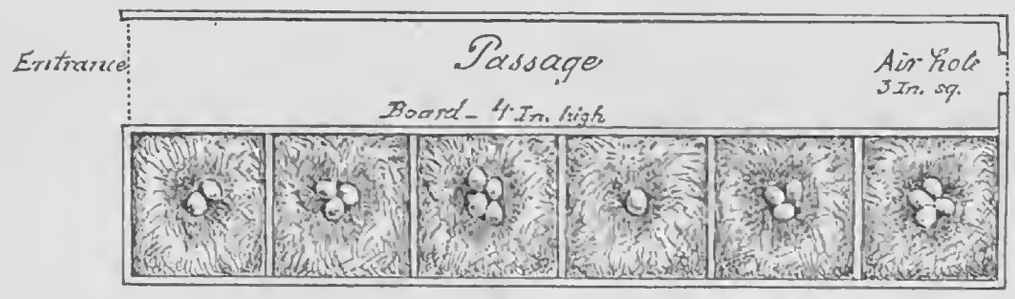


Fig. 406.

WE hope to keep lice out of the flock by not letting them get in. The houses are lined inside with tarred paper. Before the cold weather we mean to put a good coating of tar all over this. Lice can't stand tar. We make a business every now and then of dusting the fowls with insect powder. This is done at night while the hens are on the roosts. Take the hens from the roosts, hold them up by the legs and dust a pinch of the powder over their backs and under the wings. Two persons can easily treat a dozen fowls in 15 minutes. If we did not think this paid we should not do it.

WE expect to improve the laying qualities of our hens by setting eggs from our best layers. We mean to see which our best layers are and to mark their eggs for setting. As a rule, a square, "blocky," broad-chested bird, is a better layer than a long and slim bird. If we expect a calf from a good butter cow to make a good butter cow in her turn, there is no reason why we should not expect an egg from our best layer to produce a good layer. There is more in pedigree than there is in exterior markings.

THE Agricultural Gazette says that the time is coming when no good system of rotation of crops will be complete without poultry. It is proposed to move the fowls about from year to year to different fields. By means of light wire netting runs and houses on wheels this can be easily done. The design is to plow and cultivate the field in which the hens have spent a year. In this way the hens will manure the fields, the dangers from contagious poultry diseases will be lessened, and the waste product will be fed to advantage. This idea is sound. It will work well.

THE English papers are discussing the proper meaning of the terms cock, hen, cockerel and pullet. The idea appears to be that birds under one year old are cockerels or pullets. It is customary to speak of "chickens." Many farmers speak of their entire stock, young and old, as a flock of chickens.

Farm Topics.

CORRESPONDENTS' VIEWS.

FARM HELP.

Where can the farmer go to obtain good help, worth the cost? Cheap labor is the most unprofitable. No good farmer wants cheap hands. Near the city it is next to impossible to get skilled farm labor at any price. The temptation is great to employ cheap or tramp labor. Such service means a season of worrying and fretting over careless mistakes. Often the profits of a season are ruined by such cheap work. Cheap labor costs too much, yet good, intelligent farm labor is underpaid. A smart and capable young man is quick to see that he can make more money in a trade than he can on the farm, and have more time to himself. The trouble is that too much of the money for farm products goes into the hands of those who simply handle them. Consumers pay as much relatively for farm products as they do for other things. A quart of strawberries which nets the grower two cents, retails for 10 cents, and a pound of butter which retails at 30 cents nets the producer from 15 to 20 cents, and so on through the list. A swarm of middlemen, buyers, transportation companies, etc., take the legitimate profits of the farmer away from him. Unjust discrimination and unjust compensation make farming hard work and render farm labor difficult to obtain. The average pay of a locomotive engineer is almost $4 per day. This work does not require any more skill than it does to farm successfully and yet what former clears, as the result of his own labor, $1,200 a year? A brakeman or fireman can get $50 per month. The same grade of labor on the farm would ruin the farmer at over $20 per month and board. It requires as much skill to hoe corn or handle a cultivator as it does to couple cars or handle freight, and it is far more laborious. The farmer should be able to pay his hands as much as men of the same grade of intelligence could receive in any form of labor. Until he can do this, farm labor will be scarce and of miserable quality. The fact is that the handlers of farm products get so much more than their share of the compensation that they can pay higher wages than farmers can pay for the same grade of work.

Something must be done to equalize the compensation of labor. Farm products are worth so much in the hands of the consumer. The farmer must get more of this price and be enabled to improve the quality of labor by paying more for it. He must study out methods of getting his produce to market more cheaply. It must pass through fewer hands. Co-operation among farmers will work good and the support of laws that shall justly equalize transportation rates must be encouraged. J. H. G.

Queens Co., N. Y.

[R. N.-Y.—The real profits in farming do not appear in the amount of money actually laid up at the close of the year. If the engineer gets $4 per day for his labor, the point is how much can he put into the bank after providing for his family? Let him use the fruits, vegetables, milk, etc., that are used in the farmer's home, let him take his family out riding as often as the good farmer's family goes, and pay the regular price for such entertainment, and how much will he have left? When a boy on the farm years ago, there used to be young men who went to the city or railroads to work. They would come back at intervals with great stories of the money they could earn. But somehow they never *saved* any more than the young men working for $15 or $18 per month and board. The extra money earned was more than eaten up by the extra expenses. Farmers do support thousands of handlers. They do it grumblingly, but they do it all the same. They will continue to do it until they organize, study the question to the bottom and settle it themselves. The vast loads carried on the back of agriculture serve to show how much wealth lies hidden in the good old science for those who dig intelligently for it.

SOME CAUSES OF AGRICULTURAL DISTRESS.—Old farmers who came into this neighborhood 40 years ago paid for their farms with wheat at 50 cents, a market 25 miles away and merchandise higher than at present. Young farmers of the present day, with wheat at 75 cents and a market at the door, can hardly make both ends meet. Why? Politicians attempt to explain it all by the magic word —"Protection," but the thinking farmer finds other reasons. Besides the natural increase in the value of land, expenses have increased. Times have changed. Luxuries of the old days are necessaries now. Two things do much to keep the farmer back to-day. These are old debts and expensive machinery. Debts were contracted when wheat sold for twice its present price. Now to pay two bushels for one from land which yields less, is the task of these debt-ridden farmers. Can they do it? Could the manager of any legitimate business do it? The question must be answered in the near future or some of our best farms will pass from the hands of the workers into those of the capitalists. In the matter of expensive machinery the farmer should adopt these rules: 1. Buy no machinery until it is absolutely needed. 2. Buy no machinery until you know what you want and that the machine is what it is represented to be. 3. Buy nothing of tramp agents—buy from headquarters. To the farmer who is out of debt these times are as good as any the country has known. There are better bargains to be made now than at any time since the war, if one has capital.

Iouia Co., Mich. L. G. WOOD.

TOO HIGH A PRICE.—I met an old friend the other day, who has just been obliged to give up his farm. At least three times that I know of, he has taken money that ought to have helped pay his mortgage to buy things for his boys. These boys have had every chance, but they never have been made to work. Life came easy to them, and they seemed to think it always would. They are now married and doing common laborer's work or running farms on shares. They never have saved a cent, and owe plenty of small bills that they have been able to run up on the strength of their father's honesty. My friend says these boys have cost him $15 per month per boy. Figure that for 25 years, and it makes too much money to waste, even as a business venture. With that amount of money to spend upon a boy's education a good man ought to be produced—a man sound and strong to the core. How many farmers are making such men?

OBSERVER.

IF one-fourth of my hay was mouldy and damaged and I had four cows, I would sooner sell one cow than to scrimp the four on the good hay. That is my idea, every time.

Buck Co., Pa. H. T. D.

SEVERE drought has taught me one thing about growing grape cuttings. Beds of cuttings that were copiously watered came on better than ever before. I was once inclined to depend upon mulching and the natural rainfall, but hereafter I shall water copiously unless Nature does it for me. D. S. M.

Watertown, N. Y.

GOOD.—I dug on my farm a Rural Blush Potato that weighs six pounds. It is very irregular in shape. How is that for a giant?

Lake Co., Ohio. P. E. D.

THE picture of my Cheviot ram, in the RURAL of Oct. 9, was fine. He took first premium at the New York State Fair. He now weighs 275 pounds. He has taken eight first premiums and has never been beaten.

Otsego Co., N. Y. WM. CURRY.

MANY farmers have been ruined by the practice of lending their name as security for

a friend or neighbor. Never do it. It is hard to refuse sometimes, yet every man owes a solemn duty to his family. What is his is theirs, and he should run no risk of ruining them. R. C.

Orange Co., Vermont.

Field Crops.

KAFFIR CORN.

THIS is not a corn, except as all grain is called "corn" in some countries. It is a sorghum that will easily mature its grain as far north as Canada and probably in the southern part of that country. It will be remembered that the RURAL NEW-YORKER introduced the Rural Branching Sorghum years ago. It is now generally called Millo Maize in the South for the reason that some enterprising individual by the name of Millo advertised it and distributed it over the South by that name. As a northern plant we know of no other that will yield a larger amount of succulent, sweet leaves and stalks. It may be cut to the ground in midsummer, and it will not only continue to grow, but two or three stalks will start from the stump where one grew before. The trouble is that it will not with any certainty mature seeds north of North Carolina and Tennessee. We have now the Kaffir Corn, which, again, is merely one of the hundreds of different kinds of sorghum. But it is worthy of consideration by our northern as well as our southern growers. We have not as yet raised this Kaffir Corn, shown at Fig. 404. Seeds have

KAFFIR CORN. Fig. 404.

been sent to us by Mr. J. H. Alexander, of Augusta, Georgia, who furnishes the following account of it:

This grain was distributed in small quantity from the Georgia State Department of Agriculture in 1878, and in the hands of Dr. J. H. Watkins, of Palmetto, Campbell County, Ga., it has been preserved, and fully developed, and was first brought to public notice through him in 1885

It is distinctly different in habit of growth from all other sorghums with which we are acquainted. The plant is low, stocky, perfectly erect, the foliage is wide It does not stool from the root, but branches from the top joints, producing from two to four heads of grain from each stalk. The heads are long, narrow and perfectly erect, as shown in this illustration, and well filled with white grain, which at maturity is slightly flecked with red or reddish brown spots. The weight averages about 60 pounds per bushel. The average hight of growth on good, strong land is 5½ to six feet, on thin land, 4½ to five feet. The seed-heads grow from 10 to 12 inches in length, and the product of grain on good land is said to reach 50 to 60 bushels per acre. It has the quality common to all the sorghums of resisting drought. If the growth is checked by want of moisture, the plant waits for rain, and then at once resumes its processes, and in the most disastrous seasons has not failed so far in the South to make its crop. On very thin and worn lands it yields paying crops of grain and forage, even in dry seasons in which corn has utterly failed on the same lands. The whole stalk, as well as the blades, cures into excellent fodder, and in all stages of its growth is available for green feed, cattle, mules and horses being equally fond of it, and its quality not surpassed by any other variety. If cut down to the ground, two or more shoots spring from the root, and the growth is thus maintained until checked by frost.

The Kaffir Corn may be planted in the latter part of March, or early in April, in Middle Georgia. It bears earlier planting than other millets or sorghums. It should be put in rows not over three feet apart, even on the best land, and it bears thicker planting than any other variety of sorghum; it should be massed in the drill on good land, for either grain or forage purposes, and also on thin land, if forage mainly is desired. The first seed-heads form at the top of each stalk, and as soon as these show the grain well, the joints next below the top send up shoots which yield the second, third and often fourth seed-heads. If grain chiefly is desired, these heads may be all allowed to mature on the stalk, and then the whole stalk may be cured into fodder; for it is not, even then, so hard but that it will be easily cut up, and well eaten by cows and mules. But if the crop is wanted mainly for fodder, it is recommended to cut down the whole stalk when the first seed-heads come into bloom, at which stage it cures admirably and makes excellent forage. The second growth springing at once from the roots, will still mature a full crop of grain and a second full crop of forage before the middle of October —that is in Georgia.

Kaffir Corn is said to be as quick and early in its growth as the Minnesota Early Amber Cane—maturing seed about the same time. It is, therefore, reliable in any latitude in which the Amber Cane has been found useful as a forage plant, and by reason of the close massing of plants upon the land, and the wide and ample foliage, the yield of forage is equal in quantity and superior in quality to any of the later and taller-growing sorts, as the Rural Branching Sorghum, etc. The seed-heads of Kaffir are well eaten by all farm animals, and no harm has been found to result from continuous liberal feeding on both the grain and the whole plant, green or dry.

The Kaffir keeps green, and the stalk is juicy and brittle to the last, and is not a hard and cane like growth as other sorghums usually are found to be. Its low and manageable growth, ease of cultivation and harvesting, are points distinctly peculiar to it, and it leaves no troublesome stubble behind, as most of the sorghums do. Therefore, it is a desirable variety as a general-purpose plant, for green feed, grain, and dry forage on every farm, and for ensilage it should prove very valuable. Flour from the Kaffir grain has been found more nearly analogous to wheat than any other grain of its class. It is darker, of course, but is of like texture in the dough and in the cooking. For batter cakes, muffins, etc., it is excellent, having a slightly sweetish taste, otherwise not distinguishable from wheat; and for buckwheat cakes it is esteemed by many who have eaten of it, as an improvement on the original.

HOW A FINE CORN CROP WAS PRODUCED.

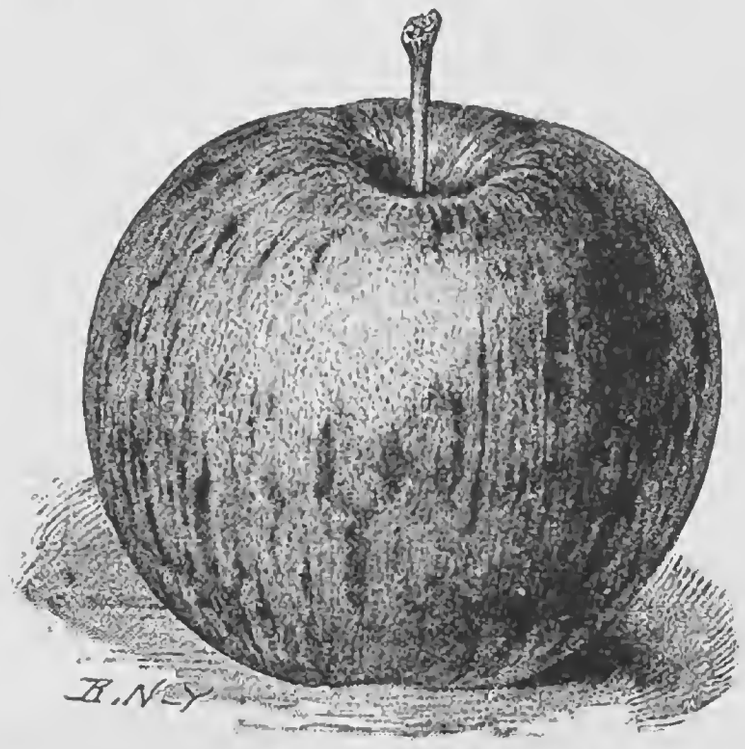
MY corn is extra good this year. I plowed up a clover sod that was not quite so good as I wanted, and put on a fair dressing of barn manure. Besides this, I used 300 pounds of phosphate per acre. The quality of the crop is the best seen from the price I got for it. I got $44 per acre for the standing corn, the buyer to do the cutting, husking and handling. The corn was worked with the horse four times and hoed twice. Can carry all the weeds on an acre in one hand. I put the phosphate into the hill on all the field but a strip at one side. In that I only put half the usual amount. When the corn got almost ready to tassel I put the rest of the phosphate at the foot of the stalk in the strip of ground I had left. This was easily done by scraping a little dirt away with the foot, dropping the phosphate and covering it with the other foot. The part of the field thus treated produced by far the best corn. The ears were larger and better filled. The part that received all the phosphate at first made the best start, but the other beat it in the end. That is the way I shall manure my corn hereafter. R. T. P.

Passaic Co., N. J.

Pomological.

THE PRESS APPLE.

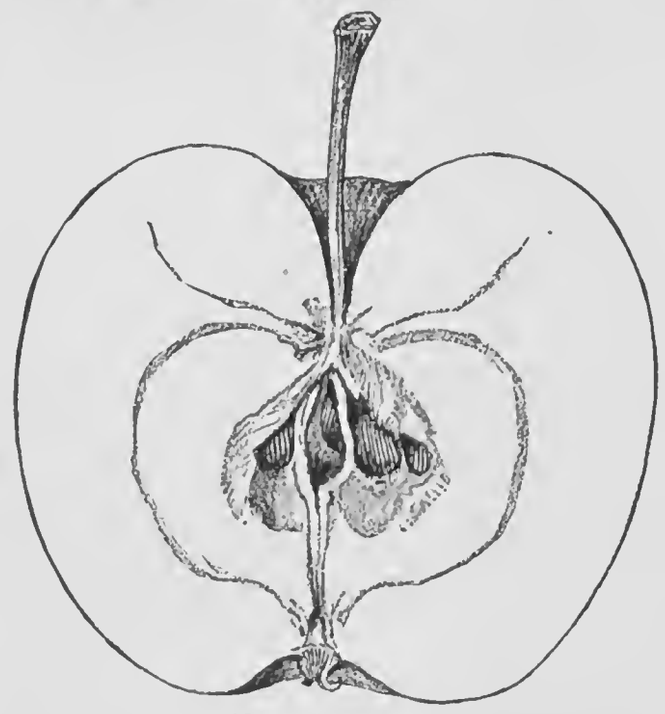
THIS lot of apples was received August 26. Our illustrations, Figs. 402 and 403, show the the shape. The color is a bright red streaked with darker red, sometimes like the Duchess



PRESS APPLE. From Nature. Fig. 402.

of Oldenburg. A very showy apple. Flesh tender, white, juicy, sprightly; agreeably subacid. We know of no better apple ripening at its season. It is well worthy of introduction.

F. L. Press, of New Providence, Ind., who sent us the specimens, says that about 12 years ago his father grafted several Early Harvest trees, one of which failed "to take" and sprouting up from the roots produced the tree that bore these apples. It has borne a full crop four times in the last five years. Its season is about with the Rambo or Seek-no-Further, October to December. Our readers should always bear in mind that engravings which are of the *exact* size of fruit always appear smaller in print.



PRESS APPLE. Cross Section. Fig. 403.

Miscellaneous.

CATALOGUES RECEIVED.

WHITMAN'S CONTINUOUS HAY AND STRAW PRESS.—Pamphlet from the Whitman Agricultural Co., St. Louis, Mo. This press is furnished with a new concentrated double-acting power, which is fully protected by U. S. patents. This new power is guaranteed to be fully one-third more powerful than the one used last season. The press as it now stands is claimed to be the most powerful, simple and rapid press in the world. Three sizes of presses are made which turn out bales 14x18, 16x18 or 18x22 of variable lengths. The 16x18 press with one horse will bale from six to nine tons in ten hours; with two horses, eight to 10 tons. A machine for making ties is sent with each press without charge. The pamphlet will be of interest to all who handle baled hay.

BROWN'S FENCE BUILDER.—Circular from John P. Brown, Rising Sun, Ind. This machine is used in making a picket fence, which is greatly praised for its durability and cheapness. The pickets are held in place by twisted wires fastened at intervals to posts. The builder runs easily and smoothly along on old boards laid on the ground, and works with such rapidity that a rod of strong fence can be built in eight minutes. Any kind of cheap material can be used for pickets. There are no nails to get loose. Boys or hunters cannot climb over it easily, as there is no support for the feet in climbing. All kinds of stock from chickens to cattle are kept out. The fence makes a good appearance. Send for the circular.

VICTORY CORN MILL.—Circular from Thomas Roberts, Springfield, Ohio. Four sizes of these mills are made, ranging in weight from 1,450 pounds to 75 pounds, and in price from $60 to $12. The larger sizes are designed for grinding feed, corn-and-cob meal, etc. The smaller size, No. 4, is designed for hand or machine power, for grinding corn, wheat, coffee, etc, etc. By its means meal can be ground for table use, and a good quality of Graham flour prepared. It is also useful in preparing food for poultry. These mills are highly praised by those who have used them. Mr. Roberts also manufactures stationary engines and boilers.

THE "CYRUS ROBERTS'" SHUCK-CORN SHELLER, CLEANER AND SEPARATOR.—Circular from Roberts, Throp & Co., Three Rivers, Mich. This corn sheller husks, shells and delivers the corn at any elevation. The corn can be run into a wagon or into bags as desired. The cobs are taken from the husk and delivered at one side, while the husks are blown out at the rear of the machine. Some remarkably strong letters of commendation are printed from those who have used the machine.

FARMER'S POULTRY RAISING GUIDE.—Pamphlet from I. S. Johnson & Co., Boston, Mass. Though intended primarily to advertise Sheridan's condition powders, this little pamphlet gives much information regarding poultry raising. Pictures of the various breeds are given. Hints as to the feeding and handling of poultry are made a special feature of the book. Aside from a tendency to unduly enlarge upon the profits of the poultry business by printing statistics and large "hen stories," the book contains much interesting matter.

LADIES' HOME JOURNAL published at Philadelphia, Pa. A very bright and readable paper which the ladies will surely enjoy. The stories are pure in tone, poor poetry is conspicuously absent, and the various departments devoted to the home are sensible and helpful. It is surely a Home Journal—one that will do good.

ALBERTSON & HOBBS, Bridgeport, Marion County, Indiana. A catalogue of fruits and ornamental plants. We notice the Lucretia Dewberry, Golden Queen and Carman Raspberries; the Purple-leaved Plum, Indian Apple, Salome Apple, Mariana Plum, etc, among the novelties.

WHITE HUCKLEBERRIES SCARCE.—A RURAL reporter says in the issue of September 11 that he understands 20 bushels of white huckleberries have been picked on the East Knob, Pike County, Pa. He must be able to make both news and huckleberries. I live within a mile of the East Knob and have picked over and around it for 10 years. I have never been able to find more than a handful of white berries at one time, and old berry pickers laugh at the idea of finding more than a quart. The writer must have mistaken the locality.

Blooming Grove, Pa. R. H.

A PATENT is pending for a new bug or insect catcher. This machine is mounted on four low wheels and runs astride of the row. The front is arranged so that the tops of potato vines are gathered in a bunch. At the back are two curved plates which strike the vines and are expected to knock the bugs into hollow cylinders where they can be caught and destroyed.

What Others Say

FEEDING SHEEP.—Jonathan Talcott's time of feeding, so he states in our esteemed contemporary, the Albany Cultivator, is at four to five o'clock in the afternoon for sheep or lambs that he wishes to fatten this season. That is a good time for the

farmer to begin to do his chores, as such work is commonly called on the farm. The sheep have pretty nearly done their grazing for the day, but will be very willing to eat a grain ration at that time. If this were fed to them in the morning, they would not have so good an appetite for grazing, and consequently would not do as well as when it is fed at night after their day's grazing is nearly over. The reason Mr. Talcott advises to sell wheat and rye, and substitute corn and oil meal in their places, is that he has seen sheep scour badly from eating wheat. No doubt they had too much to begin with, but they did not do well for some time afterward. Sheep feeding is very simple and easy, but it requires careful attention on the part of the shepherd to see that all have a chance to get their share; also that the sheep have full confidence in the person who feeds them, so that nothing is wasted either in feed or in flesh by fright or abuse of any kind. Mr. Talcott now has 45 lambs in a flock; they get a daily feed of oats, bran, with a little oil meal and salt, all mixed and fed about 5 P. M. It is an easy matter to take many of them around the neck and lift them; they seem to feel perfectly safe with him and show no fear. Such sheep or lambs if well fed always do well, and pay for their care and feeding in increased growth and early maturity, both in wool and flesh. As soon as the fall rains become cold and disagreeable, all fattening sheep should be housed at night, and fed a ration of first-quality hay, clover being preferred. After being fed their grain ration, they will eat a little every night, and that little will be of great benefit to either a fattening or store flock. Such attentions to a flock frequently show a balance on the side of profit, while the same flock neglected are kept at a loss.

SWILL FEEDING AND PLEURO.—Henry Stewart says, in the N. Y. Times, that the outbreak of contagious pleuro-pneumonia—as the disease is alleged to be—in the swill stables of Chicago is nothing strange. As this disease has its hotbeds in the swill milk dairies of Brooklyn, New York, Philadelphia and Baltimore, so the Chicago distillery-slop feeding sheds may be expected to breed this dangerous disease there. Hot, reeking wash from the stills, the foul and fetid atmosphere of the filthy dungeons in which the beasts are confined, and the insufficiency of this food to supply the needs of the animal system, all combine to poison the blood and produce disease. Just as hog cholera (intestinal fever) is produced in swine, so pleuro-pneumonia (lung fever) is produced in cattle by these overpowering unhealthy conditions. If the Bureau of Animal Industry is authorized to slaughter infested cattle, why should it not be empowered to prevent its origin in these pesthouses and from this pestilent feeding!

THE ROTHAMSTED ENSILAGE EXPERIMENTS.—The following summary of the conclusions at present to be deduced from the ensilage experiments appear from the pen of Sir J. B. Lawes in a late Agricultural Gazette: (1) That the crops which had been cut green and placed at once in the silo could be preserved for several months in a state suitable for food for stock. (2) That during fermentation in the silo, some of the nitrogen of the fresh food was destroyed, while another portion was changed from the albuminoid form to compounds of a lower food value. (3) That there was a considerable loss of other food compounds, amounting probably to about one-tenth of that contained in the crops when placed in the silo, while on the other hand there was no clear evidence that during fermentation any food was produced from substances which were not foods when placed in the silo. (4) That with very few exceptions, cows took readily to the silage, and when used with appropriate food—although slightly inferior to mangolds—it proved to be well adapted for dairy purposes. (5) That when used with cake and corn for fattening oxen, it proved to be quite equal to swedes and clover hay, used with like quantities of cake and corn. These results, comments the London Live Stock Journal, if they do not confirm the exaggerated statements that have been put forward by some of the advocates of silage, at all events prove it to be a useful food, and as such we may consider that further investigations in regard to its properties would be desirable.

THE JAPANESE BEAN.—We have several times called attention to the Soy Bean, which is so extensively eaten in Japan. Consul Hubbard sends to the State Department a translation of an article published by the Educational Museum of Tokio, from which we condense the following: The bean (Soja hispida) was first raised in China about 200 years B. C. Its use in Japan dates back to the 14th century. It is a round, yellowish-white bean, which in composition comes nearer that of animal food than any other vegetable product. The beans are used principally for making tofu or bean curd. They are soaked in water for 24 hours, and then ground in a stone mill into a thin pulp. This pulp is boiled, cooled with cold water, and then boiled again. It is then placed in a bag and pressed. The liquid is placed in a tub and receives a quantity of strong brine. This is well stirred into it, and as a result a curd forms about as thick as sour milk. This is the tofu. It is pressed into about the consistency of a cooked omelet, and cooked in various ways—fried, toasted, or made into soup. The warm water in which the beans are first soaked is used as soap, while the dry pulp is used as a fertilizer or as a feed for cattle and horses. An analysis of the Soy Bean shows it to contain:

Water	11.32
Ash	3.88
Fat	20.89
Albuminoids	37.75
Fiber	2.01
Starch, etc	24.08

It will be seen that it is particularly rich in fats and albuminoids; how rich may be seen by comparing it with other foods, as below:

	Albuminoids.	Fat.
Corn-meal	8.4	3.5
Oat meal	15.1	7.1
Rye-flour	6.7	0.8
Beans	23.2	2.1
Wheat-flour	11.1	1.1
Peas	22.9	1.8

The bean has been cultivated in Germany with success. The stalks and leaves of this plant, as raised at the Rural Grounds, are of little value as cattle food.

GENERAL-PURPOSE HORSES.—The "horse men" are down on the "general-purpose" horse Prof. Roberts says in the Weekly Press; but after all that's what the millions want. An old-fashioned Morgan enlarged to 1,100 to 1,300 pounds, with perfect feet and limbs, and after that as much style as one chooses to pay for—this is the type for every reasonable use and for money in any market. The general-purpose horse, no matter what name he is found under, is always inquired for. We admire the general-purpose man and woman. This country is populous with them. Not Jacks-at-all-trades and good for none; but evenly developed men and women good for everything their hands and heads find to do. But a very small fraction of the world's work can be done with slim, tucked-up thoroughbreds—or leggy, elephantine draft horses. Better far to raise first-class general-purpose horses for general-purpose men and women who want their work done cheaply, speedily and neatly.

GREAT FALL IN THE PRICE OF BEEF IN ENGLAND.—The wholesale price of beef has, says a Liverpool journal, of Oct. 2, not been so low for the last 30 years. Prime carcasses of American beef were disposed of a fortnight since at the Birkenhead Lairages at fourpence three-farthings (9⅓ cents) per pound. First-class store cattle were a drug at Chester fair, and could be sold only at a reduction of at least 50 per cent. as compared with the prices realized two years since. It is, therefore, expected that very heavy losses will be sustained by the exporters of American live cattle and dressed beef.

SILAGE FOR HORSES.—Mr. E. Stanley, Government Veterinarian for New South Wales, has conducted an elaborate investigation into the circumstances attending a serious attack of blood poisoning among horses at Coonong, in which sixteen valuable animals died. As a means of prevention, he suggests a change of feed for silage, such as chaff, with bran, oats, oaten hay and grass—and a constant supply of salt within their reach. The horses had been living on silage for the last six months, getting a fresh supply daily, and they did satisfactorily on it. "Cattle and sheep," remarks Mr. Stanley, "do well on this artificially-preserved food; but it is never advisable to limit animals to one article of diet. Change of food is as necessary for them as it is for human beings. No doubt ruminating animals, which have only to eat and sleep, and time to browse over the paddocks, stand a far better chance of thriving on food of this character than the single-stomached, hard-worked horse, who is required to exhaust his muscular strength day by day, so that he cannot thrive and work unless fed on clean and wholesome food with concentrated nutriment in small bulk. Hence, grain of some kind or other is his usual fare."

THE MINNEAPOLIS EXPOSITION.—It appears, according to the Minneapolis Tribune, that the recent exposition at Minneapolis was a success financially. The figures are given as follows: Cost of building, $270,636; mechanical equipments, heating, electricity, etc., $53,342; furniture, $4,354; total cost, $336,410. Total value of building and grounds, $550,000. The earnings have been $80,647, the last three days being estimated at $10,000. The net profit this year, the expenses being especially heavy, will be from $25,000 to $30,000. A dividend of from six to eight per cent. will be paid, and a fair surplus be left on hand for repairs on building and making preparations for next year's show.

CUTTING THE ROOTS.—In the case of the trees and large shrubs which we intend to transplant next Spring, we should now cut in their roots. This is done by describing a circle around the tree, say some three to six feet from the stem, and along this ring digging a deep, narrow trench in order to sever all the roots that stretch beyond. As soon as the trench is dug out, fill it up again. By this means, before planting time in Spring arrives the young trees operated on will so far have recovered themselves that with a hard heading in and proper attention in planting they do not suffer nearly so much as they would if the roots had not previously been cut around. This is the substance of excellent advice which Mr. Falconer gives the Press.

DEFECTIVE COTTON PICKERS.—According to the Savannah News the introduction of successful cotton-picking machines "is still apparently as far in the future as it was two years ago." The News adds: "There is no doubt that hopeful progress has been made by the inventors, and it is not disputed that experiments have been made in several instances that were very satisfactory to the parties concerned and to intelligent spectators; but if the practical success of the harvesters had been demonstrated it is pretty certain that the machines would now be in use on many plantations." The Mason Harvester Company, of Charleston, S. C., however, last Saturday invited the New York Cotton Exchange to send representatives to witness the trial of an improved machine in the open field at Sumter, South Carolina, on Wednesday last, and the Exchange appointed three delegates for the purpose. The value of the cotton crop is estimated at $250,000,000, and the cost of picking at $40,000,000, so there's room for a large saving by the use of machine power in the work.

THE COTTON HARVESTER EXPERIMENTS.—The Cotton Exchange committee, who attended the recent field trial of the Mason cotton harvester at Sumter, S. C., on the 13th inst., have made their report to the Board of Managers. They speak very favorably of the results of the experiment, saying:

"As a test we found upon timing its operations and weighing the result that the machine in its present shape has a picking capacity of about 2,000 pounds per day. We would further state that while some open bolls escaped the "picker stems" and were left on the plant, the general results were of such a character as to justify the belief that Mr. Mason has discovered the true principle, and may ultimately overcome all defects, and we congratulate him upon having made thus far the most successful solution of the problem."

The committee also speak in high praise of the Mason cylinder gin, based on the same principle.

SLUG-SHOT.—Mr. W. Barringer, of Ohio, says, in the Garden, he thinks the usually fair and impartial RURAL NEW-YORKER has become prejudiced against the use of slug-shot, or labors under a very imperfect experience in its use, and is unduly exercised in regard to its harmful influence. If it were necessary, he could cite many cases in his immediate neighborhood where it has been used, and not one bad result has come to his knowledge.

SLUG-SHOT AND PARIS-GREEN.—Dr. Hexamer says, in the same journal, that he believes that slug-shot is "less dangerous to higher animals" than the ordinary mixtures of Paris-green. Having used large quantities of Paris-green, and having had to entrust its mixing and application to hired men, he had ample opportunities to notice the constant danger to which those who handled it were exposed. In slug-shot—being already mixed and ready for use—all danger during the mixing operation is avoided, and also, on account of the arsenic contained in it being more evenly and uniformly distributed through the mass than this can be done on the farm, a given quantity of slug-shot can never contain as much poison as is frequently contained in an equal quantity of ordinarily mixed Paris-green and plaster. To this very fine and minute division of the poisonous principle contained in slug-shot, much of its efficacy is due, and it is mainly for this reason that even very small quantities of this insecticide prove so destructive to injurious insects.

SPIRIT OF THE PRESS.

WERE I establishing a home, my first act, after preparing protection from sun and storm, would be the planting of grape-vines says Chas. A. Green. Twine them about the stoops and piazzas, over the gables; cover the sunny sides of the out-buildings; build rough arbors of poles on the lawn and in the by-places, and let the vines clamber over these. Train them to stakes in the garden. Plant a vine.

THE coarsest manure, says Dr. Hoskins, in the Mirror and Farmer, should be drawn out and spread in the Fall, so as to allow the Fall rains and the melting snows to wash all soluble matter into the soil. Then in the Spring the coarse remainder can be turned under, and in its decay exercise an ameliorating effect upon the earth itself. The doctor is entirely opposed, upon grounds of experience, to composting or keeping manure, with the often and long recommended view of increasing its values. Dung is never worth any more than when it is dropped, and under all ordinary circumstances it is losing value every day afterwards until it is put where it is to stay..

THERE is still time to increase the rhubarb plantation by dividing the roots and replanting them. A litttle covering will help to secure a strong growth next Spring.....

THE farmers about the Rural Grounds all broadcast their seed rye. One of our best farmers uses the Cahoon broadcaster. He thinks that the rye is sown in half the time that it can be sown by hand, while it is distributed more uniformly.....

A WRITER in the Canadian Horticulturist living in Owen Sound, praises the Golden Queen Raspberry as a grand grower and altogether promising.....

THE Springfield Blackcap (thornless) has a peculiar and very pretty habit of growth. After the canes reach the hight of four or five feet they become mere switches and gracefully droop over on all sides giving the plant quite the appearance of a weeping bush.....

OLIVER W. HOLMES says that writing is like shooting with a rifle; you may hit your readers' mind or miss it; but talking is like playing at a mark with the pipe of an engine. If it is within reach and you have time enough you can't help hitting it.....

MR. HOLMES also says that only very rich persons can keep race-horses, and everybody knows they are kept mainly as gambling implements. They are gambling implements as much as roulette tables. .....

LONDON is like a shelled corn-cob on a Derby day, says Mr. Holmes, and there is not a clerk who could raise the money to hire a saddle with an old hack under it that can sit down on his office stool the next day without wincing.....

PROF. SHELTON finds that Orchard Grass will stand any amount of tramping and close grazing. He thinks, as we have already told our readers, that it is a mistaken practice to sow very thickly in order to counteract its tendency to grow in tussocks.....

THE S. S. Times truly says that skill in any one direction is commonly a result of toil in a great many directions. No man can do one thing well, if he never does more than that one thing. Let him who would be a mechanic or a farmer or a business man or a preacher bear this truth in mind.....

NOT one of the least of the qualities we desire in a rose is fragrance; in this regard all classes must do homage to La France, which H. W. Ellwanger characterizes as the sweetest of all roses. If he were compelled to choose one variety it would be La France. It is rather tender, but it can easily be protected, and so winter safely. It does not always open well, but it is a simple matter to assist it; an operation not practicable with most varieties that do not open perfectly. If La France does not develop well, by pressing gently with the finger the point of the bloom, and then blowing into the center, the flower will almost invariably expand, the pent up fragrance escape and almost intoxicate with delight our sense of smell.....

W. C. BAXTER, of Kansas, says the Industrialist, dug a sweet potato weighing six pounds.....

PROFESSOR LONG, of England, advises working people to keep a goat, because it can be kept more cheaply than any other animal and will yield a profitable return in milk. He thinks the expense of maintaining one would not exceed $5 a year, while it will eat almost any kind of food and yield from 1½ to two quarts of milk a day worth at least eight cents a quart. We find this bit of information in the Live Stock Indicator.....

IT is pretty certain that we shall have large importations of English potatoes this year, in spite of the import duty of 15 cents a bushel. In Cheshire, close to Liverpool, the crops this year of potatoes are absolutely unprecedented, and the price is lower than ever before quoted in the Chester market. Really splendid Magnum Bonums are quoted at wholesale prices as low as £2 ($10) per ton.....

FIVE pounds of common white beans ground fine, and fed in half-pound doses with bran twice daily, will cure the worst case of bloody milk, says a writer in the Farmers' Gazette, England .....

No man ever found pigs profitable who did not provide warm, sheltered beds for them in cold weather. Food supplies heat, and where

the heat is wasted by exposure to extreme cold, the animal cannot lay on fat. A little attention in providing comfortable quarters for the pigs will make all the difference between profit and loss in feeding.....

HENRY WOODS, of England, asks if the present system of over-feeding breeding stock leads to the beneficial reproduction of superior animals? He very much doubts it. He would ask any practical, thoughtful man if it is not an incontrovertible fact that the present pernicious plan of forcing breeding animals for exhibition by high and pampered feeding does not tend to make them impotent, delicate and unhealthy?.....

MR. WOODS could quote many instances where the produce of priceless animals have been sacrificed by being forced for exhibition. Mr. James How had a matchless Short-horn cow called Lady Anne, one of the best animals ever seen. She won him 26 money prizes, 10 cups and four medals, and bred three calves. The first, a bull calf, from a marked defect, was sold at a small price as a yearling. Number two calf was a heifer, and died when six months old. The third and last calf was born prematurely and only lived a few hours. Thus, a priceless animal and her produce were lost, not only to the owner, but to the breeders of the country. Had the cow been kept in fair breeding condition her progeny might have been available for the benefit of other herds.....

THE Farmers' Review says that though veterinarians scout the idea of spontaneous development of pleuro-pneumonia, there must have been such development to first introduce it, and what has once developed naturally may be repeated. This question was the subject of a controversy between Henry Stewart and Dr. Salmon in these columns last year...

THOSE who feed the well-kept horses of Adams Express Co. always put a handful or so of cut hay with the oats, otherwise a large part of the oats is not digested.....

OF all the signs of hopeless barbarism, says the Watchman, none is more infallible than the knife in the hand of a quack veterinary surgeon when he splits open a poor cow's tail to deprive her of what little blood she has got, and to season the rest with pepper and salt.....

A WRITER in the Live Stock Indicator believes it to be a fact that the Holstein is winning its way rapidly in the regard of our people as the grandest "combination cow" known. The cow in the hands of our farmers that will give the most milk, and then be easily turned into a good beef carcass, seems to be the Holstein.....

NIAGARA GRAPE.—An inquirer asks of Mr. J. J. Thomas, of the Cultivator, for the decision of cultivators on the present character and reputation of the Niagara Grape. After examining it for some years and fruiting it on his own ground, he says that while moderate in quality, its several characteristics of rampant growth, great productiveness, hardiness, and handsome appearance, will give it prominence as a market fruit until better sorts shall displace it. Its large and showy bunches have aided in giving it a high price in market, which will recede as it becomes better known. That is Mr. Thomas's opinion and we do not see that it is at variance with the RURAL'S opinion given several years ago when it first fruited at the Rural Grounds.....

LONDON dog owners are obliged to muzzle their pets. It is thought that by compelling all dogs to wear muzzles while at large, rabies can in time be exterminated. The police have orders to kill all unmuzzled dogs. The number of cases of rabies has been reduced, but so long as country dogs run at large, the disease cannot be entirely stamped out. Many people seriously object to the muzzles. It is claimed by some that the dogs are made ugly and bad-tempered by their use, and that they only prevent a muzzled dog from defending himself against a mad unmuzzled dog. On the other hand, it is claimed by veterinarians that a dog will become so accustomed to a muzzle that it will bother him but little more than a collar.

Everywhere.

RURAL SPECIAL REPORTS.

Massachusetts.

SANDWICH, Barnstable Co., October 7.—In many townships in the upper part of Cape Cod frost has done disastrous work in the cranberry bogs; while the bogs near the salt water were but slightly touched. Fully two-thirds of the cranberry crop had been harvested before the blighting frost appeared, but it is estimated that three-fourths of the berries remaining on the vines yesterday are a total loss. Many bogs were flooded yesterday, thereby saving the berries growing on them Colder weather is expected to-night, and it is feared to-morrow's reports will show heavier losses from frost than for years. L. M.

SPRINGFIELD, Hampden Co., October 7.—The average of tobacco is still on the decline throughout the Connecticut Valley, and the Hadley meadows are returning to broom corn. In the New England States potatoes yielded well and abundantly. The apple crop is not up to last year's, but pears were never so plentiful. M. L.

New York.

APALACHIN, Tioga Co., October 9.—Crops are very good. Oats a fair yield. Corn extra good. Potatoes an average crop—all the way from 100 to 200 bushels per acre in this county. Hay about two-thirds of a crop. Corn is worth about 60 cents; oats, 32 cents; potatoes, 35 cents, and no rot. D. E. S.

Texas.

ABELINE, Taylor Co., Oct. 10.—The crops were a complete failure during the early part of the season, but after the rains commenced (about August 30), a great many field peas, and turnips, and sorghum, and millet were planted, so that if we have a late frost there will be plenty "roughness" raised yet. There has been plenty of rain since it started, and the farmers are putting in a large crop of wheat under the most favorable conditions. C. R. JR.

Virginia.

RICHMOND, Henrico Co., October 16.—Our tobacco market this week shows more strength than last week, inasmuch as holders of desirable bright wrappers and fillers are not pressing sales as they were a few weeks back, and there is more disposition to buy even at prices asked, only the would-be buyers have all more or less undesirable stock that must first be unloaded. A few lots of good wrappers sold at advanced prices of two to three cents per pound. Several lots of bright cutters have also disappeared from the market at prices above 30 cents, and now more is asked for an inferior quality. Medium grades are firmer, but sales meager up to this time. There has been nothing to test the dark market, which must still be quoted quiet and without any interesting feature. The short and frosted crop has had no particular effect upon prices of offerings here, as there will be very few if any primings saved this year, and as this becomes known holders of low grades of old leaf hope to see better values for common in a short while. What new bright has been sold in the interior markets has sold very much higher proportionately than old. T. H. M.

ANSWERS TO CORRESPONDENTS.

(Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper

COMB HONEY MAKING.

Subscriber, Nova Scotia.—I have a few colonies of bees, some in box hives and some in movable frame hives, how can I get them in the best shape for making comb honey? When I got them in movable frames I thought the trouble was all at an end; but I find they build their combs in the wrong places and of wrong shapes; what should be done? All the instructions I have seen, might suit a person who understands the business, but not a beginner.

ANS.—There are several things needful in order to get nice comb honey in abundance, and not the least among them is experience. The bees must be in movable frame hives, and it is better still if the frames are reversible. The colony too should be strong, which necessitates a prolific queen. Some warm pleasant day during fruit bloom next Spring, all the bees in box hives may be transferred to movable frames, or, what is now considered by many as a better plan, wait until the storing season begins, and transfer the bees upon empty frames, or frames filled with brood, and then the bees are obliged to go above to store the honey, and as fast as new comb is made below the queen will fill the cells with eggs. If this method is followed, a queen excluder must be used above the frames. By the use of a division board, keep the brood chamber contracted so it will only contain as many frames as the bees can well cover; then as the bees increase in number, add a frame of empty comb next to the outer one containing brood. The queen, if she does her duty, will soon fill it with eggs. Then as the bees increase in number enough to cover another frame, insert it in a similar manner and so continue until the brood chamber is filled. This chamber, according to Doolittle, who is good authority, should never exceed 1,500 cubic inches inside the frames. It is of prime importance that the queen be got to laying early in the season, so as to have the colony strong when the storing season begins, and then, if the brood chamber is well filled with brood, the bees will be forced to go above to unload their stores. If there is nothing for the bees to gather early in the season, and the queen is dilatory about laying, feeding a little each day will have to be resorted to.

If the bees are inclined to store within the brood-nest, by using reversible frames and turning the brood comb the other side up, the the bees will be induced to take the honey, which is now thrown below the bees, up into the boxes. If the frames are not reversible, the same end can usually be accomplished by breaking up the caps with a knife or stick. By keeping the frames the right distance—half an inch—apart, and using wired foundation, it is an easy matter to keep the bees from building comb in the wrong place and shape. Instructions for managing the honey-board and sections, are given in an article in a preceding number of this paper by Prof. Cook. Last, and most important of all, the novice should provide himself with the best bee literature If the instructions given in such works as, Prof. Cook's Manual of the Apiary, A. I. Root's A. B. C. of Bee Culture, or Quinby's New Beekeeping are well digested this winter, success will be almost certain.

KEEPING SWEET POTATOES THROUGH WINTER IN GEORGIA.

F. T. Carr, Mo.—How can sweet potatoes be kept through the Winter?

ANSWERED BY P. J. BERCKMANS, AUGUSTA, GA.

Digging the tubers should be delayed until the vines have been sufficiently touched by frost to check vegetation. Allow the potatoes to dry off in the field, which will take but a few hours. Then sort all those of eating size to be banked separately from the smaller ones. The banks are prepared as follows: Make a circular bed six feet in diameter in a sheltered corner of the garden, throwing up the earth about a foot high. Cover this with straw and bank up the tubers in shape of a cone, using from 10 to 20 bushels to each bank. A triangular pipe made of narrow planks to act as a ventilator should be placed in the middle of the cone. Cover the tubers with straw six to 10 inches thick and bank the latter with earth, first using only a small quantity, but increasing the thickness a week or ten days afterwards. A board should be placed upon the top of the ventilating pipe to prevent water from reaching the tubers. Several banks are usually made in a row, and a rough shelter of boards built over the whole. The main point to be considered in putting up sweet potatoes for Winter is entire freedom from moisture and sufficient covering to prevent heating. It is therefore advisable to allow the tubers to undergo sweating (which invariably occurs after being put in heaps) before covering them too much, and if the temporary covering is removed for a few hours, a week after being heaped, the moisture generated will be removed and very little difficulty will follow from that cause. If covered too thickly at once, the sweating often engenders rapid fermentation, and loss is then certain to follow. Sand is never used here in banking potatoes. Some varieties of potatoes keep much better than others. The Yellow Sugar Yam and the Pumpkin Yam are the most difficult to carry through, while the Trinidad potato keeps as readily as Irish potatoes, only requiring to be kept free from frost and light by a slight covering of straw if the tubers are placed in a house. Next in keeping quality come the Hayti Yam, the Red-skinned, Brimstone, Nigger Killer, and, last of the potato section, is the Nansemond.

FEED FOR FATTENING STOCK, ETC.

Subscriber, Lyndonville, N. Y.—1. Is there a thrashing machine that will cut the straw as fast as it is thrashed, and if so who is the manufacturer? 2. Will fattening stock—sheep and steers—eat more straw cut than when fed whole? 3. Will it pay to give fattening steers straw as their main forage, cutting it and mixing it with corn and linseed meals, the whole to be wet up?

ANS.—E. W. Ross & Co., of Springfield, Ohio, make a cutter which can be attached to any thrashing machine, in such a position that the straw will fall into it as it comes from the thrasher, and be cut as fast as thrashed. We know of no other, though there may be such. 2. Not unless it is wet and mixed with meal of some kind. The principal advantages in cutting it are that it packs closer in the mow and the manure from it handles much nicer and faster. 3. We think it not desirable to mix meal with any cut forage, wetting it up for fattening stock, but prefer to feed the meals mixed together and with bran, if that is fed, and the whole fed dry. It is less trouble, and we have had fully as good results. We prefer to give fattening steers one or more feeds a day of hay (clover hay we consider best), or one feed of hay and one of corn fodder, and in addition, all the good straw they will eat, and the more grain given, especially if it be such as is rich in albuminoids, the more straw they will consume. Of course, if one is short of hay, by feeding largely of linseed meals and bran the steers will do very well fed mostly on straw for forage.

LEGAL AND MORAL ASPECTS OF GATHERING WILD FRUIT.

R. M., Norwich, Conn.—For years it has been the custom for people to take nuts, wild blackberries, etc., without consulting the owner of the land; is doing so a sin in the sight of heaven, and is it illegal?

ANS.—From the earliest days in New England and many other States, fish in the streams, lakes and ponds, wild game wherever found, wild strawberries, blackberries and huckleberries in fields and pasture lots, chestnuts, hickory nuts and hazel nuts in the woods have been considered common property, which every one was entitled to take without consulting the owner of the land on which the game was taken or killed, and the fruit gathered. There is no doubt whatever, that the land owner has a perfect legal right to prohibit all the outside world from gathering such fruit on his premises, and any person who goes on the land for the purpose commits a trespass, and not only is the trespasser himself liable to the land owner, but all who buy and consume the berries so picked are responsible. In the case of Parker *vs* Wright in Maine, the plaintiff owned wild land over which berry-pickers had roamed without leave for years. They carried off 1,500 bushels of blueberries to the defendant who had a large blueberry canning establishment at Jonesport, Me. Parker brought suit and recovered over $1,000 from the defendant, although the latter had paid for the berries, and did not know the pickers had no right to them. Where fish, game and wild fruit have long been regarded as common property, however, it is advisable for any one who objects to the custom on his land, to make his objection known by putting a conspicuous sign, forbidding anyone to enter the land for the purpose of securing them; otherwise a magistrate may dismiss the case. Wherever the owner objects and makes his objection known, it is a legal trespass and a moral wrong to go upon his land for any such purpose.

ABOUT IMPORTING CATTLE.

F. C. S., Elizabeth, N. Y.—1. What is the probable cost of importing six head of Swiss cattle? 2. Does the steamship company take care of the cattle coming over, or is it necessary to have a man come with them?

ANS.—1. The probable cost of importing the cattle will be, for actual transportation, about five pounds, or $25, exclusive of food and attention. 2. The steamship company will take care of cattle coming over, charging only the actual cost of service and food; but if a considerable number are imported (say six), it would probably be better and cheaper to have a man come with them. The usual course of procedure in importing cattle, is, first, to obtain a permit from the Secretary of the Treasury. The cattle may then be purchased. It is then necessary to go before the Consul at the port of exportation and make an affidavit that they are intended for breeding purposes only. After the cattle arrive, they must be entered at the Custom House and another affidavit is required that they are intended exclusively for breeding. This of course is to avoid the import duty. The doctor at quarantine is telegraphed for and the cattle are taken to Garfield, near Passaic, N. J., where they are kept for 90 days from the date of their shipment from Europe or port of exportation. The sheds at quarantine are free, but the owner is required to furnish food and attendance. As a matter of course, these rules apply only to neat cattle. The Monarch Steamship Company is doing most of the cattle carrying trade, because its steamers are wider, higher between decks, and carry water ballast, thus rendering them steadier in their motion and permitting perfect ventilation.

THE BROAD-NECKED PRIONUS.

F. E. H., Cawker City, Kan.—The accompanying grub is doing some damage to young trees and vines here. It eats the roots in the ground and attacks apples, mulberries, and grapes. Here it isn't very numerous yet, but I have heard of vineyards in the neighborhood completely ruined by the pest. What is it, and what can be done to circumvent it?

ANSWERED BY PROF. A. J. COOK.

The large grub is one of our largest borers. The beetle is known as Prionus laticollis. It appears in midsummer. It is brown or brownish black, and sometimes more than 1½ inch long. The jaws are strong, the thorax short

and wide and armed with three teeth on each side like all of the beetles of the family to which it belongs—Longicorns or Cerambycidæ—it has long, slim antennæ—the horn-like organs which project from the head. The grub which does the damage is yellowish-white in color, with a hard brown head armed with two strong jaws. It may grow to two or three inches in length. It feeds as a larva for three years. It bores inside the roots just beneath the ground, and is often very harmful to grape-vines. As this borer is so well concealed we can not hope to know much of its presence till we find the vines are dying. In such cases the diseased vines should be carefully examined, and as soon as the enemy is determined and found, should be destroyed before it destroys any more. This insect has not been usually accused of injuring apples, but I see no reason why it might not do so; and if F. E. H. is correct, it certainly does damage to young apple trees as well as to grape-vines.

FEED FOR COWS, ETC.

J. M. S., Watertown, N. Y.—1. Which is the best food for milking cows, wheat or buckwheat bran, the price being the same for each? 2. What proportions of the various feeding stuffs make the most profitable food for cows? 3. What are the relative exhaustive effects of the various grains and grasses, also of potatoes and roots when raised as farm crops?

ANS.—Something depends on the purpose one has in feeding the cows; but in any case we prefer the wheat bran; buckwheat bran is more than half woody fiber. 2. If we knew what the cows were kept for, we could answer this much more definitely. A good ration for butter-making is composed of two parts of corn meal; one part each of new-process oil meal and wheat bran. Another would be oats and corn equal parts ground together, and one-half as much oil meal as of either added. If fed for milk alone, give more bran and less corn in the first ration. 3. To answer this would require a volume. In a general way, oats are regarded as a very exhausting crop. So is corn, particularly of potash. The same may be said of potatoes and mangels. Timothy is regarded as a harder crop than clover. In all cases if the refuse parts are fed to animals and the manure carefully saved and returned to the fields all crops would be much less exhaustive than they are as the land is usually treated.

DRAWING WATER FROM A DISTANT WELL.

J. G. L., New Alexandria, Pa.—What kind of a pump will draw water from a well 12 feet deep and 60 feet from the place for the pump, and what sort of pipe should be used?

ANS.—There would be no difficulty in drawing the water from the spring in the following manner: dig a trench from the spring to where the pump is to be fitted, deep enough to be safe from freezing. Lay a pipe—the rustless iron pipe will be the safest and cheapest—in the trench and attach it to any good suction pump. A check valve should be fitted to the end of the pipe in the spring to retain the water and prevent leakage. Care should be taken to secure the joints of the pipe by means of white lead packing on the screws. A pump has been used by the writer in this manner to bring water from a distance of 125 feet up an incline of 25 feet with perfect ease. The cost of the pump and pipe will depend on the size, and full information on this point can be obtained from the nearest plumber or tinman who deals in pumps.

APPLES ON PARADISE STOCK.

F. E. H., Cawker City, Kans.—1. Which is the better plan—to bud or root-graft the apple on Paradise stock? 2. What is a fair average crop of fruit per tree?

ANSWERED BY P. BARRY.

To bud by all means, and the tree should be planted so that an inch or two of the stock will be above the surface of the ground. If planted as dwarf apples frequently are, so that the point of union between stock and bud is below the surface of the ground, the tree will soon form roots above the bud and the advantage of the Paradise stock will be lost. 2. An average crop per tree will depend upon the age and condition of the tree as well as the care and culture it receives, and on the variety besides. We have seen dwarf apple trees produce a bushel. They are very prolific, and an important point in their management is to prevent their bearing too heavily.

GOVERNMENT LAND OFFICES IN NEBRASKA.

W. E. W., Medina, Mich.—1. What State or Territory in the West offers the best chances to a young man with a few hundred dollars? 2. From whom can I get information about land that can be homesteaded in Nebraska?

ANS.—1. That will depend entirely on the man himself and the business he is best fitted for. A vast fortune can be made by such a young man in every State and Territory in the West, if he is the right sort. 2. Apply to the Registers of the Government Land Offices. A short time ago the Registers were the following: E. S. Butler, Neligh; H. W. Parker, Beatrice; C. W. Pierce, Lincoln; B. F. Chambers, Niobara; C. Hostetter, Grand Island; A. D. Duckworth, North Platte; J. W. Switzer, Bloomington; Joseph Morris, Valentine, and G. S. Laws, McCook. A letter inclosing a stamp for answer, addressed simply to the Register, at any of the above places, should secure the desired information.

WHEN TO SOW FERTILIZERS ON WHEAT.

C. A. B., Grand Rapids, Mich.—Which would be better—to sow commercial fertilizers on the growing wheat at this time or wait until Spring, the land being level?

ANS.—We should not do either; but would sow the fertilizer on the snow in midwinter, or even February or early March. If the fertilizers are sown now, the finer portions would collect in the sheaths and injure the stems or leaves. Besides, more or less of the nitrogen, if in the form of nitrates or ammonia, would be carried through the soil before Spring, and be lost to the plants.

CORN AND BARLEY AS FEED.

D. O. D. (address mislaid).—1. What do you think of barley as a food for cattle and sheep? 2. How does it compare with corn at present prices?

ANS.—Barley is a splendid food for growing stock of any kind, as it contains more of the flesh-formers and of bone builders than corn, but less of the material (including oil) from which fat is made. It is more of the nature of wheat than corn, and contains only one-third as much free oil as corn. 2. At present prices, corn is much the cheaper food for full-grown, fattening animals. With the 48-pound bushel of barley and 56-pound bushel of corn the proportionate prices should be about 39 cents for barley and 35 cents for corn.

LAND OFFICES IN KANSAS.

L., Arkadelphia, Ark.—Information as to the location of government land in Kansas, can be best obtained from the land agents in that State. The following were the Registers some time back. If any changes have been made of late, a letter simply addressed to "The Register of Land Office," at any of the places should elicit an answer:—J. J. Fisher, Topeka; J. M. Hodge, Selma; M. J. Salter, Independence; R. L. Walker, Wichita; J. Bissell, Kerwin; S. H. Dodge, Concordia; W. R. Brown, Larned; B. J. F. Hanna, Wakeeney, A. C. Patchin, Oberlin.

Miscellaneous.

W. G., Mt. Cisco.—One of my hens seems paralyzed on one side. She holds one leg out straight, and will not bear any of her weight on it. She seems in great pain. What is the trouble?

ANS.—The trouble is probably rheumatism or paralysis. In either case there is not much hope of a cure. Give easily digested food, such as bread and milk, a little cooked meat, etc. Give also a pill of half a grain of colchicum and a grain of opium. Rub the leg with crude petroleum and keep the bird warm and quiet.

DISCUSSION.

AGAINST THE JAPAN CHESTNUT.

W. R. S., LAHASKA, BUCKS CO., Pa.—My two bearing Japan chestnut trees dropped their first nuts Sept. 26; to-day, Oct. 12, they are all off. The nuts are rather larger than good-sized American chestnuts; but some of the latter are fully as large. This is the eighth years since the trees were planted, and this is their first bearing year. Unless I saw the nuts planted, and the fruit on the trees, I must believe the statement that they bear in three years from planting pure and undulterated bosh and buncombe. Any prosperous graft will bear in three years—even hickory. As the RURAL is inclined to doubt all adverse reports about that wonderful chestnut, I inclose some leaves so as to leave no doubt that my trees are genuine Japan chestnuts. From the representations of catalogues one would suppose the nuts could be roasted whole with diffienlty, and after the hulls had been taken off they could be placed on the table for dessert and divided into large or small pieces, as appetite desired. One would have to hunt for the pieces carefully with a microscope.

R. N. Y.—We are not inclined to doubt anything respecting the Japan chestnut and are glad to hear from our friends all they know of it. We know of trees that bore when four years old from the seeds. We know of trees that bear nuts three times the size of the best American chestnuts, and we likewise know of trees that bear nuts scarcely larger than the latter. The seedlings vary as do our American chestnut seedlings. Some are excellent in quality; some poor.—EDS.]

THORNLESS RASPBERRIES.

S. W. H., PENDLETON, IND.—In the RURAL of September 25 is an article on thornless raspberries and blackberries. We have a thornless red raspberry growing in our garden and orchard that is entirely hardy, and has never failed to bear. I know nothing of its origin. It was about as early as Hansell this season, and continued bearing for a month. It grew beside Doolittle, Mammoth Cluster and Hansell, and is larger and more vigorous in growth, as well as more productive in fruit than they. The fruit in quality and size compares favorably with the Hansell. If a trial of a few plants is made at the Rural Grounds and if they do as well as here, the editor will modify his opinion that "there is no valuable thornless raspberry."

R. N.-Y.—We should be pleased to try a few plants.

Dyspepsia

Does not get well of itself; it requires careful, persistent attention and a remedy that will assist nature to throw off the causes and tone up the digestive organs till they perform their duties willingly. Among the agonies experienced by the dyspeptic, are distress before or after eating, loss of appetite, irregularities of the bowels, wind or gas and pain in the stomach, heart-burn, sour stomach, etc., causing mental depression, nervous irritability and sleeplessness. If you are discouraged be of good cheer and try Hood's Sarsaparilla. It has cured hundreds; it will cure you.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, OCTOBER 30, 1886.

IN the supplement of the Thanksgiving Number of the R. N.-Y. we shall present, in addition to the articles offered in our regular premium-list, a carefully selected list of books.

WE have not thus far printed many of the reports received from RURAL subscribers of our seed distribution of last year. We have them all, however, and shall present them in a condensed form later. The Bird Cantaloupe has proven a fine acquisition. It has undoubtedly come to stay.

WE beg to express an opinion as to the Worden Grape: If any one were to eat first a Worden, then a Concord grape he could not tell which from the other. As to the time of ripening, there is very little difference. The Worden bunch will not average so large as the Concord bunch. The vine of either is as hardy as the other.

THE following note explains itself: "It has been decided by those who alone have the right to do so, that the Macomber white seedling of the Antwerp Raspberry is to bear the name of the beautiful lake on the shores of which it originated, "Champlain." I think Mr. O. H. Alexander is a little presumptuous to attempt to give a name to a fruit he is testing.
Grand Isle, Vt. J. T. MACOMBER."

"AMMONIATED superphosphate." What is it? Does it contain potash? If so, why call it an ammoniated phosphate? If not, how do you know that your land will respond to a fertilizer in which one of the important food elements is missing? It would seem that some of the fertilizer men are just as willing to muddle the names of chemical fertilizers as some seedsmen are to mix up the nomenclature of plants.

CALLING the attention of the reader to our cut of the everbearing blackcap "Earhart" last week, we may further add that our first plants were received from Mr. J. W. Sarff, of Havana, Ills., in May of last year, with a history of its discovery and propagation. What became of these we cannot tell. We presume they died. It was in the Fall of last year that other plants were received from the introducers, the Messrs Hale, and our observations were, of course, confined to these fall-set plants. We shall look for larger berries and more of them another season.

BULLETIN No. 19, from the Michigan Agricultural College, gives the results of Prof. Bailey's study of 76 so-called varieties of tomatoes. He has reduced the list nearly one-half, and is confident that this reduction will need to be reduced nearly another half after further study. He remarks that none are so well qualified to undertake this work of determining synonyms or duplicates, as well as a reformation of garden nomenclature as many of our seedsmen, and it seems strange that they should be the very ones who make the work necessary. The chief kinds tried by Prof. Bailey have been tried at the Rural Grounds and reports have been made from year to year. He confirms our statement that the Mikado and Turner's Hybrid are the same.

LAND COMMISSIONER SPARKS, in his annual report, reiterates his account of vast illegal appropriations of the public domain by native and foreign cattle kings and syndicates. The story has been told over and over again; what has been done to remedy the evil? We are told that fences illegally inclosing 2,714,926 acres have been removed: but this is only a small part of the great area appropriated. Over three years ago, under the last Administration, great promises were made of speedy action against the spoliators; such promises have been repeated several times since then; but it appears probable that the fresh spoliations offset the reclamations. The public heartily approve vigorous action; the reclamation of the public land fenced in and appropriated without the shadow of a title; and the punishment of the land thieves. Little progress has been made toward checking depredations on the public timber land also. Only between $100,000 and $150,000 have been recovered out of over $9,000,000 claimed. Depredations by powerful corporations, wealthy mill-owners and lumber companies are still committed to an alarming extent. The Land Office is doing all in its power to check the evils and punish the evil doers, but the government law officers should be more energetic in supporting its operations.

ASPARAGUS roots may still be planted. If not now it would be well to prepare the plot now for Spring, and to plant as early in the Spring as the weather will permit. Asparagus is really one of the easiest vegetables to raise—far easier than celery. We prefer to raise it from seed, and to sow the seed where the plants are to remain. In the preparation of the soil there is no difference whether we sow the seeds or plant the sets. A rich, deep, mellow soil is required, and that is the whole story. Our experiment of raising asparagus eight years ago from seeds may still be remembered by our older readers. Seeds of every supposed variety were procured from France, Germany and England, and sown side by side. These seeds were sown thickly in drills four feet apart and the plants thinned to one foot apart in the row. As to the size and flavor of the different kinds we never could detect any difference. The Argenteuil shoots were more silvery, the Red Dutch redder in color than the others.

The old way was to sow in a seed-bed and then transplant. But there is no reason for a special seed-bed; no need of transplanting. We merely make additional labor and defer the time when the shoots may be cut. An ounce of seed will cost 10 cents and there are fully 1,200 seeds in an ounce, and these will give plants enough for a large family. Were we preparing a bed of asparagus, we should have the plants at least two by four feet apart.

NOTICE.

THE Thanksgiving Number of the RURAL NEW-YORKER will be dated November 20th. It will present a full account of the RURAL'S next Seed Distribution, and we shall issue 24 pages. Advertising rates will be the same as usual for the regular paper (30 cents per line) and 50 cents per line for the Supplement, which will be sent out from its date until next June. *Advertising space in Supplement strictly limited to six columns.*

TAKE CARE OF THE HEALTH.

HAPPY is the farm house that does not contain its shelf of empty patent medicine bottles. It is not much of a compliment to the intelligence of farmers to say that there are few houses that cannot show this array. Why will people take so much medicine? Do they like to consider themselves sick? Is it fashionable to take medicine? Does it show poor taste to spend a little more time and money in keeping ourselves well and thus avoiding all necessity for taking medicine? Good health is the product of good food, plenty of sleep, cleanliness and a clean conscience. It is far cheaper to put the extra money and time into the work of making these four conditions perfect than it is to attempt to build up a wasted system on patent medicine. Bathing is too frequently neglected, and sleep is murdered by those who need it most. The writer does not take an ounce of medicine during the year, simply because he does not need it. A daily bath, eight hours' sound sleep, plenty of fruit at meals, a daily glass of lemonade during the Spring and an honest endeavor to look upon the bright side of every subject form a far better medicine than can be bought at any store. This treatment works so well that we feel like recommending it to others. Many people brood themselves into disease. They worry and study over their troubles until they seem too great to bear. Like the man who drinks to drown his sorrows, they take medicine to cure the blues. Others get the idea that half a dozen doses ought to cure a disease that has been gathering through years of neglect. When half a bottle fails to make them well, the medicine is discarded and a new kind ordered. Rather than have any waste, the "leavings" are given to the children. There are a few brutes left who work their wives almost to death's door, and then hurry to the store to buy, at random, a bottle of medicine with which to save the life they have sacrificed. All these people help to fill up the shelves with empty bottles. They could put a stop to the wasteful practice by paying decent attention to the laws of health.

THE CATTLE PLAGUE IN CHICAGO.

THE owners of the quarantined cows at Chicago, who were anxious to sell their milk, sought by injunction to restrain the Health Commissioner and Chief of Police from interfering with the sale of the stuff. It was shown to be unwholesome by the testimony of the physicians, and Judge Tuley, in rendering a decision against its sale, said the health officers had no discretion in refusing to allow the milk to be sold. "Clothes from a small-pox hospital," said he, "might as well be distributed around the city. If the court were to sustain the injunction against the health officers it would be a crime against society." Apart from the question of disease, it seems impossible that the milk can be wholesome after the revelations that have been made of the atrocious condition of things at the distilleries, where the cows never breathe pure air, are never properly cleaned, constantly stand knee-deep in filth, never see grass, and never have anything to eat but hot distillery refuse. Not only should the sale of such milk be strictly prohibited, but the feeding of cows under the present pernicious system at distilleries should no longer be tolerated in any part of the country. To prevent irreparable injury to the live stock trade of Chicago, and to remove imminent risk to the vast cattle interests of the country, the quarantined stock should be promptly disposed of, as well as all others that have been exposed to contagion. The plains are already excited over reports of contagious pleuro-pneumonia on the Dakota ranges. Once the disease gets a foothold on the large ranges there will be no means of checking it and the loss of the country will run high among the millions. At present it is charged that the quarantine is a paper one, and that cattle that have been exposed to the disease are being shipped not only to the more eastern States which have not yet scheduled Illinois; but also to the ranges. If this is true, it will not be over a year or two before the cattle business there will be on the road to ruin. It is quite possible, nay, very probable, that the careless nature of the quarantine, as well as the risks of contagion elsewhere have been exaggerated; but in such cases safety lies in the line of exaggeration.

MR. A. J. CAYWOOD AND THE RURAL NEW-YORKER.

MR. A. J. CAYWOOD is widely known as the originator of several valuable fruits, the result of many years of toil. He is now quite an old gentleman, and richly entitled to the thanks of the people for the good he has done them, and to a goodly share of consideration when, as in the instance we have to allude to, he shows that any adverse criticism of his fruits, impairs his sense of reason and justice. We have received a copy of his lately issued descriptive price-list in which he makes some reckless, angry statements respecting the editor of the RURAL NEW-YORKER, which, upon calmer thought, he will probably regret. The RURAL editor's offense seems to be that he has said in regard to the Minnewaski Blackberry, that "it did not promise to fill any unoccupied space." Mr. Caywood thinks that this opinion was expressed merely to injure the sale of the Minnewaski because he declined to send plants to the Rural Grounds to be tested. He then alludes to our reports of new fruits as "vacillating from bad to good and good to bad"; to the Rural Grounds as the "Valley of the Shadow of Death," and then concludes in this wise: "The country need not look for any more good words from the RURAL for any new fruits I may originate."

Here our friend is wrong. We shall speak of Mr. Caywood's productions in the future precisely in the same way as we would have done when he visited us several years ago and praised the Rural Grounds as beautiful indeed, and kindly spoke an encouraging word for the disinterested work we were doing, and offered and pressed upon us a half interest in the Marlboro Raspberry if we would consent to praise it and to keep it before the people in our advertising columns.
